2) Double-click the Font/DA Mover 4.1 application. The Font/DA Mover screen appears. The left scroll box shows the fonts currently installed in your System file. The title below the scroll box shows the location of the fonts: System on Macintosh HD.

3) Click the Open... button on the right. A standard file selection dialog box appears.

4) Find the font file (also called suitcase file) with the fonts you want to install, select it, and click the Open button (or press Return). You are taken back to the Font/DA Mover screen.

5) Select the fonts you want to install by dragging over the list on the right. (You also can hold down the Shift key and click each font.) The selected fonts are displayed in reverse type (white letters on a black background). Arrows appear on the Copy button to show the installation direction.

6) Click the Copy button to install the fonts.

7) Click the OK button.

To install desk accessories during the same session, click the Desk Accessory radio button. The left scroll box then shows the DAs currently installed in your System file. Follow steps 3-7, substituting DA(s) wherever you see font(s).

8) When you're finished, click the Quit button to go back to the Desktop (Finder). Restart your Macintosh if you're in MultiFinder.

System 6 Hints and Help

- Hold down the Option key before launching Font/DA Mover to display DAs first rather than fonts.

- System 6 has a limit of 15 desk accessories and 52 fonts.

- You can get around the System 6 limits by using a third-party extender utility such as Suitcase II or MasterJuggler.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). Macintosh TV: Television Connection Tips (12/93)

Revised: 12/1/93
Security: Everyone

Macintosh TV: Television Connection Tips (12/93)

==========

Article Created: 1 December 1993

TOPIC ----------

This article provides some tips for connecting a Macintosh TV to cable service.

DISCUSSION ----------

- Basically, anything that can be attached to a regular TV can be attached to Macintosh TV. There are two ports for a video source: coaxial and RCA. Things that have an RCA plug can also be attached to the coaxial port with the proper adapter, and vice-versa. One restriction is that closed caption must come through the coaxial port.

- In the TV Setup control panel, click on Channel Setup and select Cable (as opposed to Antenna for broadcast TV) as the source.

AppleShare Pro and CD-ROMs Created Under System 6.x (12/93)

Revised: 12/2/93
Security: Everyone

AppleShare Pro and CD-ROMs Created Under System 6.x (12/93)

==========

Article Created: 1 December 1993

TOPIC ----------

I have a custom CD-ROM disk that was shareable over AppleShare 3.0.x, but does not seem to be shareable over AppleShare Pro. The problem seems to be with AppleShare Pro not recognizing CD-ROMs that were created with a System 6.x type desktop. The CD-ROM appears on the Apple Workgroup Server (AWS) 95 desktop, but is not being shared.

I tested a CD-ROM that was known to have been mastered on a System 6.x volume. The dialog box message that is given when the (System 6.x type desktop) CD-ROM is inserted into the drive is, "The volume "xxxxx" could not be prepared for use with AppleShare Pro". The only option given is an "OK" button, which dismisses the dialog box and the CD-ROM volume appears on the AWS 95 desktop. If the AppleShare Admin program is then run, the CD-ROM does not appear in the list of available volumes. This CD-ROM cannot therefore be shared over the network.

The CD-ROM I used for testing was the "Bill and Dave's Excellent CD (Release Version)" from the Developer CD series. Interestingly, the Finder window of this mounted CD-ROM showed it to be locked, but didn't show the non-writable (crossed-out-pen) symbol. Another System 7.x formatted CD-ROM (October 93 Developer's CD) was mounted to compare it to the behavior of the System 6.x formatted CD-ROM. This CD-ROM appeared on the desktop and was available for selection in the AppleShare Admin program as a shareable volume. In the Finder, it had a locked icon as well as a non-writable icon in the Finder window for that volume.

Does this mean that System 6.x created CD-ROMs cannot be used with AppleShare Pro?

DISCUSSION ----------

AppleShare Pro is not able to share System 6.x based CD-ROMs. The CD-ROM must have System 7.x style desktop files on it for it to be shared on an

AWS 95. This limitation is a result of A/UX not allowing the desktop files for a volume to be on a separate volume. This is required when System 6.x based CD-ROMs are shared.

To illustrate, when the "Phil and Dave's Excellent CD (Release Version)" CD-ROM is first mounted on a System 7 Macintosh, the Desktop files are created and stored in the "Preferences" folder within the "System Folder". The Desktop files for the CD-ROM are on the boot volume and A/UX can't do this.

Under A/UX, it is not necessary to have System 7 style Desktop files to see the contents of the volume, but they are necessary if the volume is to be shared.

AV Computers: Using With Third Party Monitors (12/93)

Revised: 12/2/93
Security: Everyone

AV Computers: Using With Third Party Monitors (12/93)

==========

Article Created: 2 December 1993

TOPIC ----------

I tested a Quadra 840AV with several third party monitors from manufacturers like Eizo and Sony (13", 16", 19" and 21"). I connected the monitors via the built-in video port. They didn't work. I got a black screen. Apple monitors work fine.

Is there a list of display devices that work with the AV models?

DISCUSSION ----------

Apple designs its video circuits to support its own monitors. This task has become increasingly difficult given the many different screen sizes and different types of video signals now supported by Apple computers and video cards (PAL, NTSC, VGA, and so on.). It is entirely up to the third party vendors to build their monitors to conform with Apple video specifications if they choose to make their monitors compatible with Apple CPUs. Because of the almost endless number of third party monitors in the market place, Apple does not keep track of nor maintain a list of which monitors may or may not be compatible with our ever growing CPU line. I recommend you contact the individual vendors who will know if their monitor is compatible with a particular Apple computer.

Using Composite Monitors/TVs: With AV Computers (12/93)

Revised: 12/2/93
Security: Everyone

Using Composite Monitors/TVs: With AV Computers (12/93)

==========

Article Created: 2 December 1993

TOPIC ----------

Does Apple have a listing of Composite Monitors/TV Tuners that are compatible with the 660AV & 840AV computers?. Most monitors seem to scan in such a fashion that the menu bar and right side of the screen are lost. Has Apple tested the AV's to see which monitors compensate for this?

I'm running out of the Video-out RCA jack into the monitor and switching in the control panel according to the AV documentation.

A number of schools have brought this up as an issue. Is there a difference if we use the S-video output?

DISCUSSION ----------

It sounds as though you are using the monitor in the overscan mode. This is exactly how a television set operates--a portion of the video display is off the screen. This is not a problem when watching television but it is a serious inconvenience when using a NTSC receiver (TV) as an output to a computer generated signal. The solution is to operate the TV in the underscan mode. To do this you must open the monitor control panel and select the lower resolution (512 x 384) via the options button. This is the underscan mode and will allow you to see the entire raster when you "switch" to the TV.

Using the S-video output from the computer to drive an S-video compatible monitor will provide a slightly improved signal. However, the improved performance is very subtle and may not even be discernible under certain displays.

Finally, because of the almost endless number of third party monitors in the marketplace, Apple does not keep track of nor maintain a list of those which may or may not be compatible with our ever growing CPU line. I

recommend you contact the individual vendors who will inform you as to their compatibility with a particular Apple computer.

HyperCard: Sending HyperTalk in AppleScript (12/93)

Revised: 12/2/93
Security: Everyone

HyperCard: Sending HyperTalk in AppleScript (12/93)

==========

Article Created: 2 December 1993

TOPIC --------------------

How do I embed HyperTalk code in a script that is in the AppleScript environment?

DISCUSSION --------------------

After setting the language environment to AppleScript:

- Use the command "do script" and enclose the HyperTalk code in quotes. For example:

  ```
  do script "send mouseUp to card button 5"
  ```

- Or put AppleScript code in a field, then use something like this:

  ```
  do card field scriptText as AppleScript
  ```

  If the field scriptText has AppleScript code in it, the HyperTalk command will execute it as AppleScript.

PowerBook Batteries: Memory Effect (6/94)

Revised: 6/30/94
Security: Everyone

PowerBook Batteries: Memory Effect (6/94)

==========

Article Created: 2 December 1993
Article Reviewed/Updated: 29 June 1994

TOPIC ----------

Is there really a battery "memory effect" and are PowerBook batteries susceptible? The Tech Info Library contains an article from Apple Developer Tech Support that says there isn't.

DISCUSSION ----------

Yes, there is disagreement on this topic. This article does contradict the other article you refer to, but it supports the statement in the PowerBook owner's manuals. This information provided by the Battery Technology group.

Apple uses three different types of batteries in its PowerBook computers. Note that these are not interchangeable. Only use the batteries intended for your PowerBook model:

PowerBook 100 - Lead-Acid

Other PowerBook 100 series computers - Nickel Cadmium (NiCad)

PowerBook 500 series computers - Nickel-Metal-Hydride (NiHy)

PowerBook Duo 200 series computers - Nickel-Metal-Hydride (NiHy)

Lead-Acid

Recharge lead-acid batteries when they become depleted. Never fully discharge the battery. These batteries should always be kept fully charged. If a lead-acid battery becomes fully discharged, it may undergo sulfation, which means the lead electrode inside the battery converts to lead sulfate. Sulfation destroys the battery by making it unable to hold a charge.

Nickel-Cadmium

Recharge nickel-cadmium (NiCad) batteries when they become depleted. Fully discharge and recharge the battery every 90 days.
Ni-Cad rechargeable batteries suffer from an effect commonly called "memory", where if the battery is partially discharged, then recharged, it will reach a point where the perceived capacity of the battery is that level to which it has been draining to. If the battery is fully drained periodically, this effect can be minimized or eliminated. The earlier Ni-Cads had more of a problem than the ones used now.

Therefore, on PowerBooks, if a customer follows the dialog warning and plugs in the AC Adapter at that first warning, the battery will begin to develop a memory effect. It takes 50 to 100 cycles to develop the effect to the point that it will begin to affect battery life. The recommended procedure is that every 10 to 20 cycles, the battery should be allowed to drain all the way to the 3rd battery warning (the shut-off message). The machine should be left in sleep for several hours to fully drain the battery (down to 5.7 V or so), then be charged for 2 to 3 hours before attempting to use the machine again.

Best case would be to use an external battery charger to drain the battery, so that the PowerBook itself can be used. The Apple external battery charger can be used to discharge by putting the battery in the charger while the charger is disconnected from the power source. 3rd party rechargers that cycle the battery are not recommended on a regular basis, since they typically do a fast discharge, and this will degrade the battery over time. If they have a setting to disable the discharge effect, that effect should only be used every 10 to 20 times the battery is charged.

If a battery is encountered that had significantly less life than can be expected, the above procedure should be tried to make sure this memory effect isn't the problem. It should be used even if the battery is very new.

Nickel-Metal-Hydride

Recharge Ni-Hy batteries when they become depleted. Fully discharge and recharge the battery about every 30 days. Ni-Hy batteries are also subject to the “memory effect” and should be treated like NiCad batteries, as explained above.

Performa 550: Video Out Solution (12/93)

==========

Article Created: 2 December 1993

TOPIC ----------

I received a Performa 550 for my classroom and wish to use it for class presentations by connecting an external monitor. Is this possible?

DISCUSSION ----------

Power R, Inc. has developed a video out solution for the LC 520/Performa 550 called the Presenter 520. The Presenter 520 allows for output to an external monitor or LCD (liquid crystal display) panel, making it easy to display the LC 520 screen in a classroom setting.

The PowerR Presenter 520 installs in minutes with no tools and drives color or monochrome LCD panels and monitors. It installs directly onto the logic board (the video chip), leaving the LC 520 PDS slot available for an additional card. The PowerR Presenter 520 has both D-15 (Macintosh) and HD-15 (VGA) connectors for external monitors or LCD panels.

NOTE: The Presenter 520 is NOT compatible with non-multisync VGA monitors such as the Apple Basic Color Monitor.

PowerR Presenter 520 has a special educator price of $116.10.

For More Information

Contact Power R, Inc. at 800-729-6970 or 206-547-8000.

DOS Compatibility Card: Hard Drive Partitioning (5/96)

Revised: 5/6/96
Security: Everyone

DOS Compatibility Card: Hard Drive Partitioning (5/96)

==========

Article Created: 2 December 1993
Article Reviewed/Updated: 6 May 1996

TOPIC ----------

How can I partition the hard drive so it works properly with the DOS Compatibility Card, in the DOS environment and still use the hard disk for the Mac OS?

DISCUSSION ----------

The PC hard drive is very flexible. It can be a "Drive Container," which is a large file that exists on a Macintosh partition or server; it can be a physical DOS partition on a SCSI device created with a third party utility; or it can be a SCSI DOS medium (such as a hard disk, SyQuest, etc.).

Creating a Drive Container

To create a drive container, use the PC Setup Control Panel.

1) Select either the C or D drive icon
2) Select New drive file from the menu
3) Select the location for the drive container
4) Name the drive container
5) Check the Initialize Drive File box

Using a DOS Partition

To use a DOS partition, it is necessary to have a SCSI drive attached that has a DOS partition on it. Some Macintosh hard disk formatting programs allow the creation of MS-DOS partitions. You can also use an existing MS-DOS formatted SCSI drive.

Once you connect the hard disk:
1) Open the PC Setup Control Panel
2) Select the appropriate drive letter

3) Select Drive Container
4) Select the appropriate drive from the list of available choices

If the partition is new or the drive has not been used by MS-DOS before, it is necessary to use the DOS FDISK command to create the DOS partitioning information for that drive. After using FDISK, you need to format the drive using the MS-DOS FORMAT command.

Peter & Santa Claus CD: QuickTime Alert (12/93)

Revised: 12/2/93
Security: Everyone

Peter & Santa Claus CD: QuickTime Alert (12/93)

==========

Article Created: 2 December 1993

TOPIC ----------

Why does an alert appear saying that I need QuickTime installed when I launch Peter & Santa Claus?

DISCUSSION ----------

Answer:

1) Peter requires at least version 1.5 of QuickTime to run (QuickTime is an extension that plays the movies found on Peter & Santa Claus). The Peter & Santa Claus CD comes with QuickTime 1.6.1. To install it, drag it to your System Folder (press OK when your Macintosh asks if it should put QuickTime into the Extensions folder), and restart your computer.

2) If you already have QuickTime installed on your computer, perhaps the extensions were not loaded on start-up. Try restarting your Macintosh. If this still does not work, check the version of QuickTime that you are using by selecting it and choosing "Get Info" from the File Menu.

Peter & Santa Claus CD: Configuration Requirements (12/93)

==========

Article Created: 2 December 1993

TOPIC ----------

Why do I get an alert stating that I need 256 colors and 640x480 pixel resolution to run Peter & Santa Claus?

DISCUSSION ----------

Answer:

1) Peter & Santa Claus requires a resolution of at least 640x480 pixels. An Apple 12 inch RGB display does not support this resolution. This may be why you are receiving this alert. You must use a 13 or 14 inch RGB display or larger. If you are using a large enough monitor, perhaps you are running in something other than 256 colors.

2) Peter & Santa Claus requires 256 colors to run. You can set your Macintosh to run under 256 colors by going to the Monitors Control Panel and selecting 256 colors. If you do not have 256 colors available to you, you need to buy more VRAM, or a video board that supports 256 colors.

Peter & Santa Claus CD: Sound Problems (12/93)

Revised: 12/2/93
Security: Everyone

Peter & Santa Claus CD: Sound Problems (12/93)

==========

Article Created: 2 December 1993

TOPIC --------------------

Why doesn’t the Peter & Santa Claus audio always play?

DISCUSSION --------------------

Answer:

Peter & Santa Claus works with either the system sound or Sound Manager 3.0. It is true that Sound Manager 3.0 offers superior sound quality. However, Sound Manager 3.0 requires a little more memory. It seems that Sound Manager 3.0 takes an additional 10-30K of system memory when sound is being played. If this memory is not available to your system, some audio may not be heard.

To free up some memory, try the following:

1) Close all windows in Finder.
2) Quit any running applications.
3) Remove items in your System Folder that are not needed by Peter & Santa Claus (for example: Extensions and Control Panels).
4) If all else fails, try taking out Sound Manager 3.0 and using System 7.x Sound instead. Note: The goal is to have at least a 10-30K largest unused block (instead of 0K) AFTER launching Peter and Santa Claus.

Peter & Santa Claus CD: Sound & Animation Is Erratic (3/95)

Revised: 3/17/95
Security: Everyone

Peter & Santa Claus CD: Sound & Animation Is Erratic (3/95)

==========

Article Created: 2 December 1993
Article Reviewed/Updated: 17 March 1995

TOPIC ----------

Why does Peter & Santa Claus CD-ROM sound and animation play erratically?

DISCUSSION ----------

Erratic play from the CD could be a result of any one or more of the following:

• The CD-ROM disk may be dirty (fingerprints dust and so on). Try cleaning your disk.

• There may be applications running in the background (quit all applications besides Peter).

• Sharing may be on (ensure that sharing is off).

• Peter may be accessing Virtual Memory (ensure that Virtual Memory is off). If you do not have enough memory you may want to consider purchasing more.

• If you are using an older/slower Macintosh such as an LC or LC II Peter & Santa Claus may occasionally behave erratically. If you are planning on using a significant amount of CD-ROM multimedia and want optimum performance consider upgrading.

• If you are using an early or single speed CD player such as an Apple CDSC, CD 150, or PowerCD, Peter may behave erratically. You may want to consider upgrading to an AppleCD 300.

Apple File Exchange: Users Guide Error (12/93)

Revised: 12/13/93
Security: Everyone

Apple File Exchange: Users Guide Error (12/93)

==========

Article Created: 6 December 1993

TOPIC -----

On page 256, the Macintosh Users Guide for desktop Macintosh computers (#030-2651-A) says that Apple File Exchange (AFE) comes with three translator files, but it only ships with one translator file.

DISCUSSION -----

It's correct that AFE ships with only one separate translator. However, there are two built-in translators and one separate translator (DCA-RFT/MacWrite). I believe that the author counted the built-in text and binary translators as separate translators because on page 258 the manual contradicts what was written on page 256 and reads that AFE ships with one translator.

68040, PowerPC 601: Integrated FPU Is IEEE 754 Compliant (12/93)

Revised: 12/6/93
Security: Everyone

68040, PowerPC 601: Integrated FPU Is IEEE 754 Compliant (12/93)

==========

Article Created: 6 December 1993

TOPIC ----------

The U.S. federal government specification for personal computer purchases requires an FPU that is "IEEE 754 compliant, with precision ranging at least 10E+38 and 10E-38 (8 significant digits) to at least 10E+308 and 10E-308 (16 significant digits)."

Does the 68040's FPU meet this specification? Will PowerPC 601?

DISCUSSION ----------

Both the MC68040 and the PowerPC 601 microprocessors are fully compliant with IEEE 754 floating-point standards. The following tables show the approximate precision ranges for the two processors:

Single-Precision Real Format

Maximum Positive Normalized	3.4 x 10E38
Minimum Positive Normalized	1.2 x 10E-38
Minimum Positive Denormalized	1.4 x 10E-45

Double-Precision Real Format

Maximum Positive Normalized	1.8 x 10E308
Minimum Positive Normalized	2.2 x 10E-308
Minimum Positive Denormalized	4.9 x 10E-324

Extended-Precision Real Format

Maximum Positive Normalized	1.2 x 10E4932
Minimum Positive Normalized	1.7 x 10E-4932
Minimum Positive Denormalized	3.7 x 10E-4951

HyperCard 2.0: Summary of Visual Effects (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard 2.0: Summary of Visual Effects (7/92)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Visual effects in HyperCard 2.0 now work with monitors in modes other than 1-bit black and white. Specifically, monitors in 2-, 4-, and 8-bit modes (4, 16, or 256 colors) are supported. Previous versions of HyperCard (before 2.0) supported fewer visual effects, and only did so in the black and white mode. The visual effects also work on secondary monitors as long as the card window does not extend into both displays.

DISCUSSION ----------

Visual effects may now be added to button scripts by means of a visual effect selection dialog. The dialog is activated by clicking the Effect button in the Button Info dialog. After you choose the visual effect, HyperCard 2.0 looks in the button script for the first Go command to go to another card or stack. The chosen visual effect is automatically added to the button script. If a Go command is not found, HyperCard 2.0 adds the visual effect to the script, followed by the command " this card".

Two new visual effects have been added to HyperCard 2.0: Stretch and Shrink. The stretch effect appears to pull the new card image from the top, bottom or center of the current card. Shrink appears to collapse the current card image to the top, bottom or center as specified by the script. For example:

```
on mouseUp
 visual stretch from top
 go to next card
end mouseUp
```

or:

```
on mouseUp
 visual effect shrink to center
```

```
 go to stack ""
end mouseUp
```

Notice that the word "effect" after the HyperTalk phrase "visual" is optional.

You can also control these two new effects like this:

```
visual shrink to center
Or: visual shrink from center
Or: visual shrink to top
Or: visual shrink to bottom
Or: visual stretch from center
Or: visual stretch from top
Or: visual stretch from bottom
```

You can also control the speed of these effects. Examples:

```
visual dissolve slowly
Or: visual dissolve very slowly
Or: visual dissolve fast
Or: visual dissolve very fast
```

You can also add color (sort of):

```
visual barn door open slowly to grey (or gray)
visual iris open slowly to black
visual venetian blinds slowly to white---inverts card
visual venetian blinds slowly to inverse ---inverts card
```

Visuals can also be combined, however, you must "go" either to black, white, or gray; or to another stack or card for all of the effects to appear:

```
visual dissolve slowly to white
visual dissolve very slowly to gray
visual dissolve fast to black
visual dissolve very fast
go next card
```

Note: In HyperCard 2.0 the following visual attribute speeds have been changed to execute differently: "Very fast" now means "as fast as the CPU can go." "Fast" now means "twice as fast as normal".

Here's a list of these visual effects that were unique to HyperCard before version 2.0 (v.1.0-1.2.5z):

```
barn door open
barn door close
iris open
iris close
checkerboard
dissolve
scroll up
scroll down
scroll left
scroll right
venetian blinds
wipe up
```

```
wipe down
wipe right
wipe left
zoom open
zoom close
zoom in
zoom out
Flash
```

The "Flash" visual effect is actually an XCMD built into HyperCard itself by Apple. To invoke it, you would use a handler such as:

```
on mouseUp
  Flash 9 -- (any number can be used, or a repeat forever loop)
end mouseUp
```

In all releases of HyperCard before 2.0, you could also specify with colors and speed with the scripts cited above.

HyperCard: Handlers for Automatic Compacting (8/92)

==========

Article Created: 11 January 1991
Article Reviewed/Updated: 28 August 1992

TOPIC --------------------

Whenever you leave a stack that has too much free space, the initAutoCompact handler (below) will automatically ask if you want to compact it.

You can tell it to shut up, too. You can adjust the number of free bytes in a stack that this handler will allow before asking you whether you want to compact by editing the field to the right.

DISCUSSION --------------------

```
on initAutoCompact
  global autoCompactEnabled,maxFreeSizeOfStack
  put true into autoCompactEnabled
  lock screen
  push card
  go to card "AutoCompact" of stack "Cookbook Reference"
  if the result is empty -- card exists
  then put card field "MaxFreeSizeOfStack" into maxFreeSizeOfStack
  else put 25000 into maxFreeSizeOfStack
  pop card
  unlock screen
end initAutoCompact

on autoCompact
  -- Automatic stack compaction that can stop asking
  -- Whenever you leave a stack that has too much free space,
  -- this handler will automatically ask if you want to compact it.
  -- You can tell it to shut up, too.

  global autoCompactEnabled,maxFreeSizeOfStack
  if autoCompactEnabled is not true then exit autoCompact
```

```
  get the freeSize of this stack
  if it > maxFreeSizeOfStack then
    put "Compact this stack? (" & it div 1024 & "K free)" into prompt
    answer prompt with "Yes" or "No" or "Stop Asking"
    if it is "Stop Asking" then put false into autoCompactEnabled
    if it is not "Yes" then exit autoCompact
    doMenu "Compact Stack"
  end if
end autoCompact
```

HyperCard: Commands Sent Automatically in HyperCard (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

This article describes how HyperCard sends events automatically.

DISCUSSION --------------------

HyperCard sends some commands automatically in response to events, just like system messages. But unlike system messages, if the command passes all the way to HyperCard without being handled, HyperCard performs a built-in action.

HyperCard sends choose and doMenu as messages when the user chooses a tool or an item from one of HyperCard's menus. It sends close as a message when the user clicks the close box of a window.

HyperCard sends help as a message when the user chooses Help from the Go menu (or presses Command-?).

HyperCard sends arrowKey, commandKeyDown, controlKey, enterInField, enterKey, functionKey, keyDown, returnInField, returnKey, and tabKey as messages when the user presses one of those keys key.

HyperCard: If You're Not Able to Modify a Stack (10/95)

Revised: 10/27/95
Security: Everyone

HyperCard: If You're Not Able to Modify a Stack (10/95)

==========

Article Created: 15 November 1990
Article Reviewed/Updated: 27 October 1995

TOPIC ----------

I have some HyperCard stacks that will not let me make any changes to them.

DISCUSSION ----------

Here are a few possibilities why you cannot make any changes in a HyperCard stack.

Stack may be protected

The stack author or another user may have used the Protect Stack menu item in the File menu to lock the stack. To unlock the stack, hold down the Command key before you click on the File menu; continue holding down the Command key while selecting Protect Stack... from the File menu. You will be prompted for a password if one has been assigned to this stack. After entering the password, if there is one, the Protect Stack window will open. Here you can change the stack protection settings, the user level limits, and the password.

UserLevel not high enough

Before you can write your own scripts or change stacks, you must first set your user level to Scripting (userlevel 5). To do this, go to the Preferences card of your Home stack. If the option for Scripting is visible, select it. If this option is not visible, there are several ways to set the userLevel.

Type "Magic" in the message box and hit Return. If this does not work, type "Set the userLevel to 5" in the message box. This will give you access to the tools palette. Select the button tool. You should then see the outline of a big button covering part of the card. Select this button and delete it, then set the userLevel to 5.

The stack may be from an earlier version of HyperCard

The stack might be a HyperCard 1.x stack. If this is the case, there will be a small picture of a padlock on the menu bar. If you choose "Convert Stack" from the File menu, the stack will be converted to HyperCard 2.x format, and you will then be able to make changes.

HyperCard: Card Windows and Positions (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Card Windows and Positions (7/92)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

The card window position is now saved whenever a stack is closed (by leaving the stack or quitting, for example).

DISCUSSION --------------------

Thus, opening a stack always moves the card window to the last saved window position for that stack. This behavior brings HyperCard in line with standard recommendations for window handling in the Mac operating system.

Although HyperCard 2.0 can have multiple windows/stacks open simultaneously, only the loc and visible properties can be set for inactive card windows. " window," for example, no longer works on inactive card windows.

HyperCard: Closing Script Windows (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

What happens when I close a HyperCard script window?

DISCUSSION ----------

To close a script window:
• Click the window's close box.
• Choose Close from the Edit menu (or press Command-W).
• Hold down Command-Option and click.
If you close a window in which you've made changes, HyperCard asks you if you want to save the changes before it closes the window.

Shortcuts

To close a script window without saving your changes, press Command-period.

To close a script window and save your changes, press Enter.

HyperTalk: Adding Comments to Scripts (7/92)

Revised: 12/8/93
Security: Everyone

HyperTalk: Adding Comments to Scripts (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

In HyperTalk scripts, a string of two hyphens (--) indicate a comment. HyperTalk ignores all characters that follow the double-hyphen.

DISCUSSION --------------------

In the following example, the strings "Displays a dialog box" and "the user's reply" are ignored by HyperTalk.

```
on mouseUp
   -- Displays a dialog box
   answer "What?" with "No" or "Yes"
   put it -- the user's reply
end mouseUp
```

Shortcuts

- To comment several lines at once, drag to select the lines you want to comment, then choose Comment from the Script menu (or press Command-hyphen).

- To uncomment several lines at once, drag to select the lines you want to uncomment and then choose Uncomment from the Script menu (or press Command-=).

HyperCard: Converting Stacks to Version 2.x (11/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Converting Stacks to Version 2.x (11/92)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 30 November 1992

TOPIC ----------

The file format for HyperCard 2.x differs from that of earlier versions. Stacks in the old format can be opened read-only by HyperCard 2.x. When such a stack is opened, a standard Macintosh padlock symbol appears in the menu bar, indicating the stack is read-only, and the Compact Stack item from the File menu becomes Convert Stack... instead.

DISCUSSION ----------

In order to convert a stack to HyperCard 2.x format, open the stack, choose the Convert Stack... item, and click OK in the confirmation dialog box.

NOTE: Once the stack is converted to HyperCard 2.x format, it can no longer be opened by earlier versions of HyperCard without using third party utilities.

Before converting a stack, keep in mind that you can always save a copy of it by choosing Save A Copy... from the File menu. Because the copy is an exact duplicate of the current stack, you can use Save A Copy... to archive versions of your stacks in the old format or any other.

Most operations on stacks, such as entering text into fields, creating new buttons, or editing graphics, are not allowed until the stack is converted. When you attempt to perform such operations within a stack in the old format, a dialog box appears informing you that you must first convert the stack before performing the operation.

Cards from converted stacks do not retain their background ID number the first time they are copied. Original 2.0 stacks are not a problem.

HyperCard: Tips for Creating Menus (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Tips for Creating Menus (7/92)

==========

Article Created: 9 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

During the creation or modification of menus, or when menus are addressed from scripts, menu items must be referenced by exact name or number. To avoid the error "No such menu item", remember these simple rules.

DISCUSSION --------------------

- "MenuItem" (single word) is the correct way to refer to a menu item in a HyperTalk script.

- Menu items may be referred to by name or number. Names must be exact. For example, in the standard HyperCard menus, menuItem 1 of menu "File" is "New Stack..." . The three periods must be used in the name when referring to this menuItem.

  NOTE: Although all standard menu items with three dots use simple periods, try an ellipsis (Option-semicolon) if your menuItem command fails.)

  To refer to a menu item by number, count the first menu item as 1, and be sure to count menu separators (--------------) as you would any other menu item. (menuItem 4 of menu "File" is "-----------------")

- In the Style menu, the "9" (for point size) is actually " 9" -- that's TWO spaces in front of the nine. So to reference point size 9 from the Style menu, the script needs to do something like doMenu " 9". If you omit the leading space ("9"), HyperCard will be unable to identify the menu item.

HyperCard: Debugging Scripts (11/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Debugging Scripts (11/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 30 November 1992

TOPIC ----------

HyperCard provides some useful tools for troubleshooting your scripts. These debugging tools let you step through a handler line by line as it runs, inspect the values of variables, and trace the flow of messages.

DISCUSSION ----------

Debugging a Handler

To debug a handler, follow these steps:

1) Open the script that contains the message or function handler you want to debug.

2) Click to place the insertion point on the line with the on or function statement that defines the handler.

   Or, depending on where you want to start, place the insertion point on any statement of the handler that is not a comment.

3) Choose Set Checkpoint from the Script menu (or press Command-D) to set a temporary checkpoint.

   A checkpoint tells HyperTalk where you want to start watching the script as it runs.

4) Press Enter to save the script and close the script editor window.

5) Perform the action in HyperCard that activates the script (for example, click a button).

   When HyperCard hits the checkpoint, it opens the script and puts a box

around the current statement. HyperCard also displays the Debugger menu.

HyperCard does not enter the script editor itself: All HyperCard menus remain in the menu bar. (Since the script is still running, HyperCard must preserve the current context.) But only the Debugger menu is active.

6) Choose commands from the Debugger menu to proceed.

The Step Menu

- Runs the current statement and moves to the next one.

- If the current statement calls another message or function handler, Step does not switch to the new handler and step through it. It just gets the result of that call.

Step Into

- Runs the current statement and moves to the next one.

- If the current statement calls another message or function handler, Step Into does switch to the new handler so you can step through it.

Trace

- Runs through the rest of the statements one line at a time, but without pausing after each statement.

- If the current statement calls another message or function handler, Trace does not switch to the new handler and trace it.

Trace Into

- Runs through the rest of the statements one line at a time, but without pausing after each statement.

- If any statement calls another message or function handler, Trace Into will switch to the new handlers and trace them as well.

Go

- Runs the remainder of the script from the current statement without stepping.

- After a Go command, HyperCard leaves the Script Editor window open, but activates the window containing the current card.

Trace Delay...

- Displays a dialog in which you can specify the number of ticks that HyperCard will pause between each statement as it traces a handler.

Set Checkpoint

- Places a checkpoint at the current line of a handler.

- This command changes to Clear Checkpoint if you've already set a checkpoint on the line.

Abort

- Stops the script from running. After an Abort command, HyperCard leaves the Script Editor window open and active.

Variable Watcher

- Shows or hides the Variable Watcher, a window that allows you to inspect the values of parameter variables or global and local variables as they are set during the execution of a handler.

- To change the value of a variable using the Variable Watcher, click to select a variable. Its value appears in the bottom panel. Edit the value and press Enter to save it.

Message Watcher

- Shows or hides the Message Watcher, a window that allows you to watch what messages HyperCard sends as it runs the script.

- For example, if you step through a statement such as doMenu "New Card", the Message Watcher will show the closeCard and openCard messages that run when the new card is added to the stack.

HyperCard 2.1: Sending Apple Events to Claris Resolve (11/92)

Revised: 12/8/93
Security: Everyone

HyperCard 2.1: Sending Apple Events to Claris Resolve (11/92)

==========

Article Created: 12 August 1991
Article Reviewed/Updated: 30 November 1992

TOPIC --

You can send almost any Claris Resolve Script command from HyperCard 2.1 to Claris Resolve using Apple Events. Claris Resolve, however, has a 254 character limit for each "dosc" event (the event which HyperCard sends with the HyperTalk "Send" command.

You will generally receive a -1708 error as theResult of your Send command if you exceed this limit.

The following handler will allow you to send scripts of any length from HyperCard to Claris Resolve in the most efficient manner possible. It sends as many lines as possible within the 254 character limit.

DISCUSSION ---

```
on mouseUp
  put empty into scriptChunk
  put 0 into counter
  put 1 into i
  repeat until i > the number of lines in field "Script"
    add ( the number of chars in line i of field "Script" + 1 ) to counter
    if counter > 254 then
      send scriptChunk to program "Claris Resolve"
      If the result is not empty then
        answer the result
        exit mouseUp
      end if
      put empty into scriptChunk
      put 0 into counter
    else
      put ( line i of field "Script" & space ) after scriptChunk
      add 1 to i
```

```
    end if
  end repeat
  send scriptChunk to program "Claris Resolve"
  answer "Your script is complete!"
end mouseUp
```

Where:

- Field "Script" is a field containing the Claris Resolve script you wish to send (you may need to specify it as a card field if it is not a background field).
- It is assumed in this example that Claris Resolve is already running on the same machine.
- Modifications to this script are required if you wish it to launch Claris Resolve or if it resides on a different machine. In the second case, you need to specify the full network pathname of the application.
- This method does not allow for logical structures such as For loops or IF statements. Logical structures must be sent in one complete chunk or errors will occur.

You can also create a simple loop that sends the commands one line at a time. This method, however, will be slower - especially when sending events across a network.

HyperCard: Formatting Phone Numbers Consistently (5/93)

Revised: 12/8/93
Security: Everyone

HyperCard: Formatting Phone Numbers Consistently (5/93)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 3 May 1993

TOPIC --

Here's a short HyperTalk script that will automatically convert phone numbers to a consistent format on data entry.

DISCUSSION --

Here' a basic script that formats U.S. phone numbers to appear in the consistent formats 1-408-555-0000, (408) 555-0000, or 555-0000. If you try to format something that doesn't look like a phone number, the script will leave the value as you entered it. To use the script, attach it to any field that contains a telephone number. The number will be reformatted whenever you make a new entry or change text in that field. This script is an example. Modify it to create your own customized version or to format numbers for your area.

```
on closeField
  – Assuming first line contains phone number.
  put line 1 of me into PhoneNum
  -– Remove non-dial characters.
  repeat with CurChar = length of PhoneNum down to 1
    if char CurChar of PhoneNum is in ")(-" & space & tab
    then delete char CurChar of PhoneNum
  end repeat
  -– Format a phone number.
  if length of word 1 of PhoneNum is 11 –
  and char 1 of PhoneNum is "" then
    put "-" after char 7 of PhoneNum
    put "-" after char 4 of PhoneNum
    put "-" after char 1 of PhoneNum
  else if length of word 1 of PhoneNum is 10 then
    put "-" after char 6 of PhoneNum
    put ")" after char 3 of PhoneNum
```

```
    put "(" before PhoneNum
    put PhoneNum into line 1 of me
  else if length of word 1 of PhoneNum is 7 then
    put "-" after char 3 of PhoneNum
    put PhoneNum into line 1 of me
  -- end if
  If the number does not match, then do nothing.
  pass closeField
end closeField
```

HyperCard: Writing Function Handlers (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Writing Function Handlers (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

How do I write function handlers?

DISCUSSION --------------------

When you write a handler for a function, you specify statements that compute and return a value to the handler that calls the function. Each function handler has the following form:

```
function functionName
   statements
end functionName
```

HyperCard has many built-in functions, and you can write your own:

```
  put square(5) into the Message box
end mouseUp

function square x
  return (x * x)
end square
```

The function square receives a number through its parameter variable, x. It then returns the value of x * x to the handler that called it (mouseUp) using the return keyword.

HyperCard: Reacting to AM and PM in the Time (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Reacting to AM and PM in the Time (7/92)

==========

Article Created: 21 December 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

How can HyperCard be taught to respond differently, depending on whether it's morning or afternoon?

DISCUSSION --------------------

Here's a handler that, when its stack is opened, says either "Good Morning" or "Good Afternoon", whichever is appropriate:

```
On OpenStack
  global openfirst
  if openfirst <> "yes" then
    get the time
    if it contains "PM" then
      play SoundName --plays "Good afternoon sound" if it is PM
    else
      if it contains "AM" then
       play soundName --plays "Good afternoon sound" if it is PM
      end if
    end if
    put "yes" into openfirst
  end if
end OpenStack
```

The reason you declare you "global" up front (in addition to the fact that in all programming you must declare your globals first before using them) is so that when the user leaves the stack and re-enters it, it won't execute the script "from scratch" all over again.

HyperCard: Converting HyperCard Data to FileMaker (2/93)

Revised: 12/8/93
Security: Everyone

HyperCard: Converting HyperCard Data to FileMaker (2/93)

==========

Article Created: 24 January 1990
Article Reviewed/Updated: 25 February 1993

TOPIC --

The following HyperCard script is a general approach to converting stack data to FileMaker format. To use it, create a new button on any card, then enter the text below into the script area of the button. When you are done entering the script, click the new button to begin the export process.

DISCUSSION --

```
on mouseUp
  put the short name of this stack & ".txt" into fileName
  ask "Send text to what file?" with fileName
  if it is empty then exit mouseUp
  put it into fileName
  open file fileName
  repeat with i=1 to the number of cards
    go to card i
    repeat with j=1 to the number of background fields
      repeat with k=1 to the number of lines of bg field j
        if k > 1 then write numToChar(11) to file fileName
        write line k of background field j to file fileName
      end repeat
      write tab to file fileName
    end repeat
    write return to file fileName
  end repeat
  close file fileName
end mouseUp
```

How it Works
The text contents of the HyperCard stack will be put into a text file that will read into FileMaker in exactly the same format as it existed in HyperCard. Create a new FileMaker file with the same number of fields as

in the HyperCard stack and use the "Input From" command to read in the text file. After the file is read in, examine the data in the fields and rename the fields as appropriate.

This script converts all the Returns pressed inside the HyperCard fields to vertical tabs for the benefit of FileMaker. Thus, large fields with many lines will become large fields with many lines in FileMaker. If you want to break field data up into more meaningful chunks (for example, "City," "State," and "Zip" instead of "Address") you must either modify this script or create a calculation field in FileMaker to parse the fields using text manipulation functions (left, middle, right, and position). Most people find working in FileMaker more comfortable. Without writing the appropriate script in HyperCard or building the proper formulas in FileMaker, there is no way to "magically" convert such items into separate fields, since the structure can vary so much.

HyperCard: Exporting Text with Page Breaks to MacWrite II (8/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Exporting Text with Page Breaks to MacWrite II (8/92)

==========

Article Created: 31 July 1992
Article Reviewed/Updated: 26 August 1992

TOPIC --------------------

Here's how to export a field from HyperCard to a text file that will be read into MacWrite II with page breaks between lines.

DISCUSSION --------------------

```
on mouseUp
  ask "export data to what file"
  if it is not empty then
    put it into filename
    open file fileName
    repeat with i = 1 to the number of lines of field 1
      write line i of field 1 & numtochar(12) to file filename
    end repeat
    close file fileName
  end if
end mouseUp
```

The key line is "write .... numToChar(12)...", because that's what does the page break. Ascii 12 is a page break.

HyperCard: Problems Selecting and Highlighting Text (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

If I select some text in a field and then click a button, the selection goes away. What can I do?

DISCUSSION ----------

You can turn off the autohiliting in the button. (Choose the Button tool and double click on the button. In the dialog that opens up, uncheck the "hilite" box.) The Human Interface Guidelines state that only one item (text, a button, etc.) can be hilited at a time.

HyperCard 2.x: Hot Text, Group Text, Shared Text (11/92)

Revised: 12/8/93
Security: Everyone

HyperCard 2.x: Hot Text, Group Text, Shared Text (11/92)

==========

Article Created: 6 November 1990
Article Reviewed/Updated: 30 November 1992

TOPIC ----------

This article describes the hot text features of HyperCard 2.x:
• the clickText, clickChunk, and clickLine functions
• the Group text style
• Shared text

DISCUSSION ----------

Functions

In HyperCard 2.x, as in previous versions of HyperCard, once a field is locked, it can handle mouse clicks just as HyperCard buttons. In HyperCard 2.x, all of the text within a locked field becomes eligible for use as a trigger for action. When a user clicks within the text of a locked field, three new HyperTalk functions, the clickText, the clickChunk, and the clickLine, are available to return information about the click. With these functions, a handler can determine which text string the user clicked and respond accordingly.

• The clickText function returns the actual text that was clicked.

• The clickChunk function returns a chunk expression that describes the text that was clicked -- for example, "char 1 to 3 of bkgnd field 3".

• The clickLine function returns a chunk expression describing the line that was clicked -- for example, "line 5 of card field 2".

Remember that the HyperTalk definition of a line is determined by carriage returns, not by the way the lines are wrapped in a field. By default, all text is grouped into words, and the clickText and clickChunk functions will return information about the word that was clicked.

The following example handler -- which can be placed in the script of a locked field, a card, a background, or a stack -- performs a simple glossary lookup using hot text.

```
on mouseUp
 lock screen
 put the clickText into whatWasClicked -- must be done before leaving card
 go stack ""
 find whatWasClicked in field "" -- is it a glossary entry?
 if the result is not empty then -- not found
       go back
       unlock screen -- looks like nothing happened
    else unlock screen with visual effect dissolve -- shows glossary entry
end mouseUp
```

Other examples of hot text:

```
on mouseUp
 if the clickText is "" then show card field ""
 -- pops up definition of ""
end mouseUp

on mouseUp
 if the textStyle of the clickChunk is bold then show cd fld ""
 if the textStyle of the clickChunk is italic then show cd fld ""
 -- In this field, a click on an italicized word has a different effect
 -- from a click on a bold word.
 -- This works because clickChunk returns a chunk expression,
 -- and in HyperCard 2.0 chunks of text have properties.
end mouseUp
```

Group Text Style

As a way to override the standard grouping of text, HyperCard 2.x introduces a new text style: Group. By selecting a string of text within a field and choosing Group from the Style menu, designers can "stick" words or characters together so that they can be used more intelligently within scripts.

Grouping affects only the value of the clickText, the clickChunk, and the clickLine functions when text within the string is clicked. When such a click occurs, the clickText and clickChunk functions return information about the entire group, instead of just the individual word that was clicked. The clickLine function returns the line number of the first character of the group.

To illustrate the effect of grouping text, say we have a list containing the names Billy Bob, Billy "Bob" Smith, and Billy Smith, and we wish to have more information about each of these individuals appear on the screen when his name is clicked. Unless their names were grouped, HyperCard wouldn't know what to do when the user clicked the word Billy -- the clickText function would return only that single word. If we select each of the full names and set its text style to Group from the Style menu, the

clickText function will return the full name when any part of it is clicked.

By itself, the Group text style makes no visible change to the appearance of text -- but you can find the grouped text in a field through the commands Show and Hide. The command "show groups" will draw a 2-pixel high gray line under all grouped text. Grouped text will be shown throughout the current session with HyperCard until the Hide Groups command is sent. For example:

```
show groups -- shows a 2-pixel gray line under all grouped text on the card
hide groups -- hides the gray lines
```

Keep in mind that showing groups will not necessarily identify all Hot Text, as hypertext responses from text in fields can be keyed to words, line number, character position, text style, text size, font, or special characters in words.

Note the differences: with Hot text, HyperCard always knows exactly which words in a field a user clicked: you can then tell HyperCard how to respond to that click. For example, you can write a script that tells HyperCard to display a hidden pop-up field that appears only when a user clicks on a specific word. When using Grouped Text, you can write scripts that tell HyperCard what to do when users click entire groups of words.

Shared Text

This feature appears in the Field Info dialog box. Shared text means that you only need to enter text once in a background field and the text will appear on every card with that background. Shared text can be activated as Hot Text.

HyperCard: HyperTalk, Script, and Handler Defined (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: HyperTalk, Script, and Handler Defined (7/92)

==========

Article Created: 15 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

What is HyperTalk?

DISCUSSION ----------

HyperTalk is the HyperCard scripting language. It lets you write English-like statements that respond to events (such as when the user clicks a button or goes to a new card).

In HyperTalk, responding to an event is called handling the event. As a scripter, you will write a specific handler for each event that you want your stack to handle. A collection of handlers is called a script.

HyperCard: Placing Insertion Point in a New Card (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Placing Insertion Point in a New Card (7/92)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Users often want to open a new card and have HyperCard automatically place the cursor (I-beam insertion point) on the first line of the first field on the card, rather than having to click at this location with their mouse or having to use their Tab key. Here's a handler that does it automatically.

DISCUSSION --------------------

```
on openCard
   tabKey
end openCard
```

The tabKey function places the cursor automatically in the first line of the first field in the Tab order or a HyperCard stack. If the field is not empty, the whole text of the first line will be selected.

This script works on all versions of HyperCard from 1.2.5 through 2.1x.

HyperCard: Compatibility with Icon Colorizer (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Compatibility with Icon Colorizer (7/92)

==========

Article Created: 29 October 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Customers may have problems when they're running both Icon Colorizer INIT under System 6.0.x and HyperCard, while their monitor is set to color.

DISCUSSION ----------

This combination may cause some icons in HyperCard to appear poorly. It appears that Icon Colorizer is attempting to colorize these icons, while HyperCard, being a black and white program, is not allowing this to happen. The icon which results is a black and white representation of a full color image, and it may therefore lose significant detail.

HyperCard: Why Compacting Sometimes Fails (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Why Compacting Sometimes Fails (7/92)

==========

Article Created: 21 December 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

When users set up a user-defined message inheritance path in HyperCard 2.0, and they try to compact their stacks, compacting fails. Why?

DISCUSSION ----------

This happens because stacks cannot be compacted when the "start using" command is in use.

Here's a typical script showing a user-defined message inheritance path:

```
On OpenStack
  start using stack "XYZ"
end OpenStack
```

Now, here's a typical script for compacting stacks:

```
On Mouseup
  doMenu "Compact Stack"
end Mouseup
```

The compact stack script won't work, because the resources of stack "XYZ" are also in use as well.

Here's a "compact stack" handler that does work, and makes the user-definable mess academic:

```
On Mouseup
  stop using stack "XYZ"
  doMenu "Compact Stack"
  start using stack "XYZ"
end Mouseup
```

Here's a "bells and whistles" stack from Claris' "Tech Support Navigator" stack series, which pops text into the message box informing the user what's going on:

```
on mouseUp
  repeat 2
    set cursor to busy
  end repeat
  stop using stack "XYZ"
  put "Now compacting your Stack..."
  repeat 17
    put "  " before msg
  end repeat
  doMenu "Compact Stack"
  wait 90
  repeat 40
    put "  " before msg
  end repeat
  wait 30
  put "Compacting of your Stack was successful..."
  repeat 12
    put "  " before msg
  end repeat
  wait 2 seconds
  repeat 60
    put "  " before msg
  end repeat
  hide msg
end mouseUp
```

HyperCard: The Message-Passing Order (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: The Message-Passing Order (7/92)

==========

Article Created: 15 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

What is meant by HyperCard's "message-passing order"?

DISCUSSION --------------------

The order in which HyperCard passes a message to objects is called the message-passing order.

Initially, HyperCard sends messages to a specific button or field or to the current card. If a button or field doesn't handle the message, it goes on to the current card. From the current card, the message goes to the following objects, in this order:

- the current background
- the current stack
- the stack script of the Home stack
- HyperCard itself

What happens if an object that receives a message doesn't handle it?
In this case, HyperCard passes the message to other objects and searches their scripts for a message handler that matches the current message.

HyperCard 1.2.5: Microsoft Mail Compatibility (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard 1.2.5: Microsoft Mail Compatibility (7/92)

==========

Article Created: 14 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

There is a problem when you receive Microsoft Mail while using HyperCard 1.2.5.

DISCUSSION ----------

When your mail system notifies you with a "beep" that mail arrives, HyperCard intercepts this signal and causes the Macintosh to emit a constant beep, that seemingly cannot be stopped unless you restart the computer. If you find yourself affected by this, remove the MS Mail desk accessory. As soon as the Mail window opens, the beep sound will stop. This does not occur in HyperCard 2.0

HyperCard & MultiFinder: Running Scripts in Background (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard & MultiFinder: Running Scripts in Background (7/92)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

With HyperCard 2.x, you can switch to an application under MultiFinder while a script is running, and the script will continue to execute while HyperCard 2.x is in the background. The sorting and compacting operations also work while HyperCard 2.x is suspended.

DISCUSSION ----------

HyperCard 2.x yields time to MultiFinder (and hence other applications) under the following circumstances:

- When HyperTalk handlers execute
- When the busy cursor is rotated (for example, during sorting, compacting, and printing)
- During the Show Cards and Wait commands in scripts

HyperCard 2.x notifies the user when his intervention is required (for example, a script wants to display an Ask or Answer dialog. When this occurs, HyperCard 2.x beeps, puts a diamond next to its name in the Apple menu, and flashes its small icon in the menu bar. A dialog appears when HyperCard 2.x becomes the active program. Because HyperCard needs some working room on the disks you create, make sure you have at least 50K or so of free space on each HyperCard disk you use.

HyperCard: How to Open a Script (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

How do I open or edit HyperCard scripts?

DISCUSSION ----------

Three ways to open a background's script window:
- Choose Bkgnd Info... from the Objects menu and click Script.
- Hold down Shift while you choose Bkgnd Info... from the Objects menu.
- Hold down Command-Option and press B. Pressing Command-Option-B again closes the script.

Four ways to open a button's script window:
- Select a button using the Button Tool, choose Button Info from the Objects menu, and click Script.
- Hold down Command-Option to peek at the visible buttons and click one (with the Browse tool).
- Hold down Shift while you double-click a button (with the Button tool).
- Hold down Command-Option to peek at visible and hidden buttons and click one (with the Button tool).

Three ways to open a card's script window:
- Choose Card Info... from the Objects menu, and click Script.
- Hold down Shift while you choose Card Info... from the Objects menu.
- Hold down Command-Option and press C. Pressing Command-Option-C again closes the script.

Four ways to open a field's script window:
- Select a field using the Field Tool, choose Field Info from the Objects menu, and click Script.
- Hold down Command-Shift-Option to peek at the visible fields and click one (with the Browse tool).
- Hold down Shift while you double-click a field (with the Field tool).

- Hold down Command-Shift-Option to peek at visible and hidden fields and click one (with the Field tool).

Three ways to open a stack's script window:

- Choose Stack Info from the Objects menu, and click Script.
- Hold down Shift while you choose Stack Info from the Objects menu.
- Hold down Command-Option and press S. Pressing Command-Option-S again closes the script.

HyperCard: Using Parameter Variables (12/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Using Parameter Variables (12/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 10 December 1992

TOPIC ----------

What are parameter variables in HyperCard?

DISCUSSION ----------

A handler can receive values (called parameters) and use them as it runs. You represent each value with a container called a parameter variable. Parameter variables always follow the handler name in a comma-separated list.

For example, when running the following mouseUp handler, HyperCard calls sayMessage with two values, "red" and "apple". It then binds these values to the parameter variables color and fruit in the sayMessage handler.

```
on mouseUp
  sayMessage "red", "apple"
end mouseUp

on sayMessage color, fruit
  put "I want a" && color && fruit
end sayMessage
```

You can use the variables color and fruit anywhere inside the handler. When HyperCard sees them, it uses the values currently bound to them (the variables remain bound only while the handler runs).

HyperCard: Dealing with Pathname Problems (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Whenever I try to launch an application or another stack from inside HyperCard, I get the standard file dialog asking questions like " is "My Hard Disk:Applications:Excel"?

DISCUSSION --------------------

Even the best scripters run into this now and then. Remember that a path like

: My Applications: HyperCard

is not the same as

:My Applications:HyperCard

You must specify the EXACT pathname, including (or excluding) spaces, trademark symbols, bullets, and the like. In the Finder, make sure that you have the names exactly right; if your script still doesn't work, check the file names to make sure they don't have an extra space at the end, or perhaps two spaces instead of one in the middle.

When you're running a script containing simply " Red Ryder", HyperCard may ask you, the first time you run your script, where " Ryder" is. Once you have pointed " Ryder" out to HyperCard via the standard file dialog, it will store the path information in the Home stack and it won' ask you again unless you run your stack from another system (which would have an entirely different set of paths).

HyperCard: Preventing Users from Interrupting Scripts (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

As a stack developer, how can I stop a user from pressing Command-Period (interrupting an action) during one of my scripts?

DISCUSSION --------------------

You can't. But if your script involves hiding and showing buttons and fields, here's a way you can make sure the stack is returned to normal in the event a user presses Command-Period during the process: at the start of the script, "set the cantModify of this stack to true". Also, in your idle handler, add the line "the cantModify of this stack to false". That way, if the user cancels during the hiding and showing, the stack will revert to the way it was before the user initiated the action.

HyperCard Player: Some Stacks Don't Work with It (9/93)

Revised: 12/8/93
Security: Everyone

HyperCard Player: Some Stacks Don't Work with It (9/93)

==========

Article Created: 2 September 1993

TOPIC --------------------

This article describes conditions under which a HyperCard stack cannot work with the HyperCard Player.

DISCUSSION --------------------

A stack with an interface and features that depend on running at userlevel 4 or 5 will not function properly with the HyperCard Player because the Player's userLevel is set to 3 on idle. For use with the Player, level 4 and 5 actions have to be scripted by the developer, so the stack would need to be rewritten.

Some of the XCMDs that are included with the HyperCard Development Kit are not included with the Player: message watcher and variable watcher, script editor, etc. If the stack developer has scripted anything related to these XCMDs, the Player generates an error. It is common practice, for example, for developers to call "hide window" for both the variable and message watchers to make sure they are not open when the stack is first opened. Calling a hide window on a window that does not exist, however, will result in an error. While there is no damage in getting the error, pressing OK, and returning to using the stack, it is inconvenient to get frequent errors.

When using the Developer's Licensing Kit tools to merge the Player with a stack to create a standalone application, developers must keep in mind that the housekeeping duties normally handled by the Home card will not be built in automatically, because the embedded stack effectively becomes the Home stack. Chores such as saving and restoring search paths, therefore, need to be added to the stack script of the embedded stack.

HyperCard: Finding and Displaying the Application Version (7/92)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Can I determine, without leaving HyperCard, what version of HyperCard is running?

DISCUSSION --------------------

In the message box, type "the version". HyperCard will return the exact version or revision number of HyperCard that is running.

This works in version 1.2.5 and 2.x of HyperCard.

This article is adapted from the Claris Tech Info database.

HyperCard: Invoking the Variable or Message Watcher (7/92)

==========

Article Created: 4 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

How can I invoke HyperCard's variable watcher?

DISCUSSION --------------------

Here's how to invoke the Variable Watcher in HyperCard 2.x: In the message box, type "vw" (it's not case sensitive) then press Return.

To invoke the Message Watcher, type "mw" instead.

HyperCard: If Wrong Palette Appears (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: If Wrong Palette Appears (7/92)

==========

Article Created: 9 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Sometimes palettes don't appear when they should, or the wrong palette appears. Why is this?

DISCUSSION ----------

If a palette doesn't appear when called, but no error message is generated, then the likely cause is that there is no PICT resource for the palette (or it is corrupted). This may happen if the PLTE resource is installed without its corresponding PICT resource.

Also, if there is no corresponding PICT resource (with the same id number as the PLTE resource), then the palette will appear with the first PICT that it does find in the resource fork of the file. So the wrong palette picture might appear, but the active buttons (which may not be visible) will be for those of the palette that was called.

Compact Macintosh: Power, Reset & Interrupt Buttons (12/93)

Revised: 12/3/93
Security: Everyone

Compact Macintosh: Power, Reset & Interrupt Buttons (12/93)

==========

Article Created: 3 December 1993

TOPIC ----------

This article describes the location of power, reset and interrupt switches on all compact Macintosh models.

DISCUSSION ----------

General Information: Power Switch

Power switches on compact Macintosh models are usually located on the back of the unit, near the left side. When facing the computer, you should be able to use your left hand to reach around to the back of the Macintosh and operate the rocker switch. When the computer is on, the top part of switch, marked with an "I," should be pressed in. The Power switch on the Macintosh Color Classic is on the back of the unit, near the right side.

General Information: Reset Switch

The Reset Switch, also known as the Programmer's Switch is usually located on left side of compact Macintoshes. The exact position varies, but is usually near the rear of the unit, protruding from the vents near the base. There is no Reset switch on the Macintosh Color Classic.

There are two switches or buttons to press. The first, nearest to the front of the unit is the reset switch. Pushing the reset switch is the same as turning the power switch off and then on.

The second switch, nearest to the back of the unit, is the interrupt switch. This switch is used by Macintosh software programmers when writing applications and debugging them. Pushing the interrupt switch will produce a blank dialog box on the Macintosh screen. Programmers can then type codes to obtain the response or information they require from the Macintosh.

Compact Macintosh Model Specifics

• Macintosh 128K, 512K, 512KE, and Macintosh Plus:
- Power Switch: Rocker switch located on the rear side of the unit, near the left side.
- Programmer's Switch: small dark beige or medium gray plastic switch located on left side of the unit near the rear. Reset button is closer to the unit front, interrupt button is closer to the unit rear. User must install switch.

• Macintosh SE, SE/30:
- Power Switch: Rocker switch located on the rear side of the unit, near the left side.
- Programmer's Switch: light gray rectangular plastic switch located on left side of the unit near the rear. Reset button is closer to the unit front, interrupt button is closer to the unit rear. User must install switch.

• Macintosh Classic, Classic II, and Performa 200:
- Power Switch: Rocker switch located on the rear side of the unit, near the left side.
- Programmer's Switch: small light gray rectangular plastic switch located on left side of the unit near the rear. Reset button is closer to the unit front, interrupt button is closer to the unit rear. Switch is preinstalled.

• Macintosh Color Classic:
- Power Switch: Rocker switch located on the rear side of the unit, near the right side. You can also turn the computer by using the power key on the keyboard, as long as the power switch on the back of the unit is in the on position.
- Programmer's Switch: No programmer's switch. To reset, use the following keyboard keys:
  To Restart, hold down the Command, Control and Power keys.
  To interrupt, hold down the Command and Power keys.
  To Shutdown, press the power key.

ABS Tech Note: AS04 AppleEvent Data Limits (11/93)

Revised: 12/3/93
Security: Everyone

ABS Tech Note: AS04 AppleEvent Data Limits (11/93)

==========

Article Created: 30 November 1993

TOPIC --------------------

This technical note describes the built-in limit of 32K for returned data.

DISCUSSION --------------------

The AppleEvent programming interface has a built-in limit of 32K for returned data. This affects AppleSearch, because it is unable to return larger amounts of data. In release 1.0, if the data returned is greater than 32K, then the call is never returned and the client is never notified.

Because of this, it is important to keep the data returned by AppleSearch through the AppleEvents API to under 32K bytes, which allows for roughly 300 items.

System 7.1 Clean Installation from 800K Disks (5/95)

Revised: 10/14/96
Security: Everyone

System 7.1 Clean Installation from 800K Disks (5/95)

==========

Article Created: 3 December 1993
Article Reviewed/Updated: 17 May 1995

TOPIC ----------

This article presents the steps necessary to perform a clean installation of system software version 7.1 using 800K installation disks. Follow these instructions in the order presented.

DISCUSSION ----------

Purpose of a Clean Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It's also useful in troubleshooting.

Restart with Disk Tools

Shut down your Macintosh computer, insert Disk Tools in the floppy drive, and turn on the computer. At the desktop, the Disk Tools floppy disk should be in the upper-right corner of your screen with your hard disk's icon below it.

NOTE: If you have a Macintosh that requires System 7 (for example, PowerBook or Quadra), you can't start up from the 7.1 Disk Tools 800K disk. Because of the limited disk space, this disk contains system software version 6.0.7. Use the system software version 7.0.1 Disk Tools disk that came with your Macintosh instead.

Run Disk First Aid

Disk First Aid software can detect and repair problems with a hard disk.

1) Double-click on Disk First Aid, and make sure the startup drive is selected. If it isn't, click the Drive button to select the main hard drive.

2) Click on Open and then on Start. Disk First Aid will check your hard drive for any potential problems. If it finds problems, you should let it repair them.

3) Repeat this procedure for each hard drive attached to the system.

4) When you're finished verifying the hard drives, choose Quit from the File menu to return to the desktop.

If Disk First Aid can't repair a hard disk, you should back up the hard disk and re-initialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup.

Update Hard Disk Drivers

If you don't have an Apple hard disk or use third-party software to format your disk, don't use the Apple HD SC Setup Utility. However, you should contact your hard disk vendor to verify that your formatting software is compatible with system software version 7.1.

If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that's on the Disk Tools disk, following these steps:

1) Double-click the HD SC Setup icon to launch it.

2) Click on the Update button.

3) When you're finished, click Quit to return to the desktop.

Sometimes HD SC Setup can't update the hard disk driver (indicated by a "dimmed" Update button). Here are some possible causes and solutions:

- If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard disk.

- If a version of Apple HD SC Setup more recent than the version on the Disk Tools disk formatted your hard disk, don't update the hard disk drivers.

- If an earlier System 6 version of Apple HD SC Setup formatted the drive, it may not have left enough room for the updated driver. You don't have to update hard disk drivers. However, if you intend to use file sharing or have a Macintosh that can use virtual memory, then you need to back up the disk and re-initialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver is corrupt, the Macintosh doesn't recognize the drive (that is, the disk doesn't show on the desktop when you start from a floppy disk). You may wish to re-initialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver has been modified with compression or security software you will not be able to update the driver. Contact the vendor for additional help.

Check Available Hard Disk Space

Be sure you have at least 5,120K (5MB) available on the disk where you plan to install the system software. To check hard disk space, follow these steps:

1) Choose Control Panels from the Apple menu.

2) Double-click the Views control panel to open it.

3) In the Views control panel, check "Show disk info in header."

4) Open your hard disk's window.

The amount of available disk space appears in the upper-right corner of any open window.

If there's less than 5,120K (5MB) available, you'll need to delete some unnecessary files by dragging them to the Trash. Choose Empty Trash from the Special menu and you'll have more disk space available.

Disable the System Folder

You disable the System Folder by moving the System and renaming the System Folder.

1) Open your hard disk's icon and locate the System Folder.

2) Open the System Folder and locate the System.

3) Move the System into the Preferences folder.

4) Close the System Folder's window and rename the System Folder "Storage."

5) Close all windows that are open on your desktop.

Restart Your Computer

Choose Restart from the Special menu. The system automatically ejects the Disk Tools disk, and after a few seconds you should see a picture of a disk with a flashing question mark.

If your Macintosh starts up from the hard drive, you have an extra System Folder on the hard disk. You need to delete it or disable it as described in the

previous section, then restart.

When you get the disk with the flashing question mark on your screen, you can continue. If you still don't see this on your screen, turn off your Macintosh and all attached peripherals and disconnect the SCSI cable from the back of the Macintosh. Start your Macintosh again.

Install System 7.1

Install system software version 7.1, following these steps:

1) When you see the disk with a flashing question mark, insert Disk Tools into the floppy drive.

2) When the desktop appears, choose Eject Disk from the File menu.

3) Remove Disk Tools, and insert the Install 1 disk.

4) Double-click the Installer on the Install 1 disk. Disk swapping (6 or 7 times usually; more if using the System 7.0.1 Disk Tools disk) between Install 1 and Disk Tools is normal.

5) When the "Welcome to the Apple Installer" message appears, click OK and then click Install.

6) Insert the other disks when the Installer asks you to.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks aren't available, you may move the non-standard items from the Storage folder to the new System Folder. Be careful not to replace anything that's already in the new System Folder. Only move items that aren't already in the new System Folder.

1) Open each corresponding folder within the System Folder and the Storage folder and then compare the contents.

2) Move anything that isn't already in the new System Folder and its subfolders from the Storage folder and its subfolders.

3) Restart your Macintosh.

Troubleshooting Extension Conflicts

If you've installed any system extensions or control panels, you'll probably see their icons line up across the bottom of the screen when you restart. They load into memory at startup time and modify the standard behavior of the operating system.

Verify INIT Conflict

If the Macintosh fails to restart or behaves erratically, you probably have an incompatible, or conflicting, INIT (also known as a system extension or control panel). To verify this problem, follow these steps:

1) Be sure the Caps Lock key is off.

2) Restart, and after you see the picture of a smiling computer hold down the Shift key.

3) Release the Shift key when the "Welcome to Macintosh, Extensions Off" message appears.

4) When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting extension or control panel. Continue with the next section.

Remove and Replace INITs in System Folder

1) Create a new folder on the desktop.

2) Open the System Folder, Extensions folder, and Control Panels folder. Choose by Kind from the View menu. Find all items of Kind "system extension" or "control panel" and move them to this new folder.

3) Close the System Folder, and restart the Macintosh.

4) Attempt to recreate the problem.

5) Move one item from the new folder on the desktop to the closed System Folder and restart the Macintosh.

6) Attempt to recreate the original problem.

Repeat steps 5 and 6 for each item in the new folder on the desktop until the problem recurs. The last item returned to the System Folder is probably the cause of the problem.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

When the Macintosh behaves as expected, drag the Storage folder to the Trash,

and choose Empty Trash from the Special menu.

System Update

After performing a clean installation of System 7.1, you may want to consider installing System Update 3.0 to ensure that you have the most current version of the system software.

System Update 3.0 is available from the Apple Software Updates area of many online services. More specific information about how to find the updates on these services is available in Fax document #20729. If you do not have access to any online services, please call 1-800-SOS-APPL for more information.

Article Change History:
08 Feb 1995 - Added compressed driver information.
27 Oct 1994 - Review for consistency and update format.
28 Jan 1994 - Added more information to the HD SC Setup section.

Security: Everyone

PowerBook: Power, Reset & Interrupt Buttons (8/96)

==========

Article Created: 3 December 1993
Article Reviewed/Updated: 12 August 1996

TOPIC ----------

This article describes the location of power, reset, and interrupt buttons on all Macintosh PowerBook models.

DISCUSSION ----------

General Information: Power Buttons

The Power button on PowerBook models is usually located on the back panel of the unit close to the left side. When facing the computer, you should be able to use your left hand to reach around to the back of the PowerBook, open the back panel door, and operate the button. The Power button for PowerBook 200 models is located on the top right side of the keyboard. The PowerBook 100 has no Power button, just press any key on the keyboard to turn it on.

General Information: Reset and Interrupt Buttons

The Reset and Interrupt buttons are usually located in the back panel of the PowerBook, near the left hand side. PowerBook 200 models do not have Reset and Interrupt buttons, see the PowerBook 200 series section below for equivalent keyboard commands. On the PowerBook 100, the Reset and Interrupt buttons are located in a recessed area on the left side.

The Reset button is marked with a small triangle. Pushing the Reset button restarts the PowerBook; it is the same as turning the power switch off and then on.

The Interrupt button is marked with a small circle. It is used by Macintosh software programmers when writing applications and debugging them. Pushing the Interrupt switch produces a blank dialog box on the Macintosh screen.

Programmers can then type codes to obtain the response or information they require from the Macintosh.

PowerBook Model Specifics

• PowerBook 100:
- Power Button: No power button, press any key on the keyboard to turn it on.
- Reset and Interrupt buttons: Located in a recessed area on the left side. The Reset button is the closer of the two to the front of the PowerBook 100.

• PowerBook 140, 145, 145B, 160, 165, 165c, 170, 180, and 180c:
- Power Button: Located on the back of the unit inside the back panel. Open the back panel door to operate the power button.
- Reset and Interrupt buttons: Reset and Interrupt functions are accomplished by using a paper clip to press either button. They are recessed into the case at the back, both are marked as described above.

• PowerBook 520, 520c, 540, 540c:
- Power Button: Located at the upper right of the keyboard. It can be identified by a circle with a vertical bar inside.
- Reset and Interrupt buttons: Use the following keyboard commands:

To restart (Reset), hold down the Command, Control, and Power keys.
To interrupt, hold down the Command and Power keys.
To power down, hold down the Command, Control, Option, and Power keys.

• PowerBook 5300 (all models) and PowerBook 190
- Power Button: There are two - on the upper right of the keyboard and behind the access door on the back of the unit below the video connector.
- Reset and Interrupt buttons: Use the following keyboard commands:

To restart (Reset), hold down the Command, Control, and Power keys.
To interrupt, hold down the Command and Power keys.

• PowerBook Duo 210, 230, 250, 270c, 280, 280c, 2300, 2300c:
- Power Button: There are two - on the upper right of the keyboard and on the back of the unit near the right side when facing the front of the unit.
- Reset and Interrupt buttons: Use the following keyboard commands:

To restart (Reset), hold down the Command, Control, and Power keys.
To Interrupt, hold down the Command and Power keys.

• Duo Dock and Duo MiniDock:
- Power Button: Located on the back of the unit near the left side when you facing the front of the unit.
- Reset and Interrupt buttons: No reset or interrupt buttons. Use the power button to turn the unit off and on again.
- Eject Button on the Duo Dock: Located on the right front of the Duo Dock, next to the opening. The Manual Eject button is located on the

left hand side of the Duo Dock.

Article Change History:
12 Aug 1996 - Added 5300 series.
29 May 1996 - Added how to power off the 500 series.
13 Mar 1995 - Corrected wording of Duo MiniDock.

Modular Macintosh: Power, Reset & Interrupt Buttons (12/96)

Revised: 12/5/96
Security: Everyone

Modular Macintosh: Power, Reset & Interrupt Buttons (12/96)

==========

Article Created: 3 December 1993
Article Reviewed/Updated: 5 December 1996

TOPIC ----------

This article describes the location of power, reset, and interrupt buttons on all modular Macintosh models.

To determine the equivalent Performa model to those Macintosh models listed below, refer to the Tech Info Library article "Macintosh to Performa Comparison Chart."

DISCUSSION ----------

General Information: Power Buttons

The Power button on modular Macintosh models is typically located on the back of the computer close to the right or left side (depending on the model). When facing the computer, you should be able to reach around to the back of the computer and operate the button.

Exceptions to the standard power button placement are most Macintosh Centris and Quadra models. Please refer to model-specific descriptions below.

Power buttons come in different shapes and sizes. Some are push buttons (round or square), which may be plain, or may include a sideways triangle or a circle with a small straight line inside. Others are toggles, which include a 1 and a 0 (1=On, 0=Off).

General Information: Reset and Interrupt Buttons

The Reset and Interrupt buttons are located in different areas on different models. Please refer to model-specific descriptions below.

The reset button is marked with a small triangle. Pushing the reset button restarts the computer. It is the same as turning the power switch off and then on.

The interrupt button is marked with a circle; if the button is large enough there is a crooked line in the circle. It is used by Macintosh software programmers when writing applications and debugging them. Pushing the interrupt button produces a blank dialog box on the Macintosh screen. Programmers can then type codes to obtain the response or information they require from the Macintosh.

MODULAR MACINTOSH MODEL SPECIFICS

Macintosh II, IIx, IIfx

Power

On the back of the computer, toward right side when facing the front of the computer.

Reset and Interrupt

Light gray rectangular plastic switches located on right side of the computer near the rear. The Reset button is located closer to the computer front, the interrupt button is closer to the rear. You must install the buttons.

Macintosh IIcx, IIci

Power

On the back of the computer, toward right side when facing the computer's front. (Rotate the Power button 90 degrees to enable automatic restart if power is interrupted.)

Reset and Interrupt

Small light gray rectangular plastic switches located on front of the computer close the left side. The Reset button is located on the left, the interrupt button is on the right, as you face the front of the computer. You must install the buttons.

Macintosh IIsi, LC, LC II, LC III, LC 475, Quadra 605, Performa 400 series

Power

On the back of the computer, toward the right side when facing the computer's front.

Reset and Interrupt

None. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh LC 550, Macintosh TV, Performa 550, Performa 560

Power

On the back of the computer, to the right of the power plug when facing the computer's front.

Reset and Interrupt

None. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh LC 575, Macintosh LC 580, Performa 575, 577, 578, 580

Power

On the back of the computer, to the right of the power plug when facing the computer's front.

Reset and Interrupt

None. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Power Macintosh 5200/75 LC, 5300/100 LC, 5400, Performa 5200 and 5300 series

Power

On the back of the computer, above the power plug when facing the computer's front.

Reset and Interrupt

None. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh 630 family, Performa 6200, 6300, and 6360 series

Power

On the back of the computer, toward left side when facing the computer's front. It is next to the DB 15 Monitor connector, toward the outside. It is also called the Standby power and is used when the computer will not reset or interrupt.

Reset and Interrupt

None. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh Performa 6400 series

Power

On the back of the computer, toward right side when facing the computer's front. It is next to the Monitor connector, toward the outside. It is also called the Standby power and is used when the computer will not reset or interrupt.

Reset and Interrupt

None. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh IIvx, IIvi, Performa 600, Centris 650, Quadra 650

Power

On the back of the computer, toward right side when facing the computer's front. (Rotate the Power button 90 degrees to enable automatic restart if power is interrupted).

Reset and Interrupt

Small round buttons in a recessed area on the front left of the computer. The Reset button is on the left, the Interrupt button on the right as you face the front of the computer.

Power Macintosh 7100 series

Power

On the back of the computer, toward right side when facing the computer's front.

Reset and Interrupt

1. Small round buttons in a recessed area on the front left of the computer. The Reset button is on the left, the Interrupt button on the right as you face the front of the computer.

- or -

2. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh Centris/Quadra 660AV

Power

On the front of the computer, directly beneath floppy disk drive toward right side.

Reset and Interrupt

None. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh Centris/Quadra 610

Power

On the front of the computer, directly beneath the floppy disk drive toward the right side.

Reset and Interrupt

On the back of the computer, toward the left side, next to the Sound output/input port. See the Getting Started booklet for more details.

Power Macintosh 6100 and Performa 6100 series

Power:

On the front of the computer, directly beneath floppy disk drive toward right side.

Reset and Interrupt

1. On the back of the computer, toward the left side, next to the Sound output/input port. See the manual for more details.

- or -

2. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh Quadra 700, 800

Power

On the back of the computer, toward top when computer is positioned vertically. (Rotate the Power button 90 degrees to enable automatic restart if power is interrupted).

Reset and Interrupt

Small round buttons in a recessed area on front of computer, toward the bottom when the computer is positioned vertically. The Reset button is on the bottom, the Interrupt button on the top when the computer is positioned vertically.

Power Macintosh 8100 series

Power

On the back of the computer, toward top when computer is positioned vertically.

Reset and Interrupt

1. Small round buttons in a recessed area on front of computer, toward the bottom when the computer is positioned vertically. The Reset button is on the bottom, the Interrupt button on the top when the computer is positioned vertically.

- or -

2. To restart (reset), hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh Quadra 840AV

Power

On the front of the computer, to the right of floppy disk drive. If the computer "locks up," hold the Power button in for three seconds to shut it down.

Reset and Interrupt

None. To restart, hold down the Command, Control, and Power keys. To interrupt, hold down the Command and Power keys.

Power Macintosh 7200, 7500, and 7600 series

Power

On the front of the computer, below the speaker on the left side.

Reset and Interrupt

To restart (reset), hold down the Command-Control and Power keys. To interrupt, hold down the Command and Power keys.

Power Macintosh 8500 and 9500 series

Power

On the front of the computer, toward top when computer is positioned vertically.

Reset and Interrupt

To restart (reset), hold down the Command-Control and Power keys. To interrupt, hold down the Command and Power keys.

Macintosh Quadra 900, 950

Power

None. Equipped with a Key Lock on the front, toward the top left when the computer is positioned vertically. There are three positions for the key lock: Off, On, and Secure. The three positions are marked with a circle, an "I", and a lock icon respectively.

Reset and Interrupt

Small round buttons in a recessed area on the front of the computer, toward the top left when the computer is positioned vertically. The Reset button is on the bottom, the Interrupt button on the top when the computer is positioned vertically.

ABS Tech Note: DAL35 DAL For A/UX Technical Overview (11/93)

==========

Article Created: 30 November 1993

TOPIC

This document describes the files created by installation of Data Access Language 1.4 on the A/UX operating system.

DISCUSSION

Overview

Data Access Language Server 1.4 supports connections to two databases: Oracle, and Informix, using one of three connection protocols: asynchronous via a serial connection, TCP/IP and ADSP. This document gives an overview of DAL under A/UX, describing what the server files are, how they relate to each other, and how each function is accomplished.

Installing DAL

Installation of DAL is straightforward. These examples use Oracle 7.0, but Informix is essentially the same process. First, it is important to install the database first and make sure it's running correctly before installing DAL. It is a common error for someone to try to install both the database and DAL at the same time and try to debug getting them running simultaneously, which is very difficult. By installing them a piece at a time, you make your life much easier.

This is a sample installation. To begin, insert the Oracle server floppy into the server and log on as root. We then create the directory to hold the server software (by default, /users/dal), then use tar to extract the files:

```
# cd /users              (data the user types)
# mkdir dal              (data the user types)
# cd dal                 (data the user types)
# tar xfv /dev/rfloppy0  (data the user types)
```

```
Once the files are copied over, you need to run DALinstall to complete the
installation (Note in this case the user dalsys already exists in
/etc/passwd.  If it doesn't, it's created for you):

# DALinstall             (data the user types)

 - DAL Host Software Installation Script -
 - dalsys user already exists -
 - Setting file permissions -
 - DAL adsp listener already configured -
===
 - Configuring ORACLE -
 |  To install DAL demo data tables for ORACLE (after this install
    completes):
 V  Invoke sqlplus/sqldba as scott/tiger and enter the following command:

      SQLprompt>  @/users/dal/data/oracle_script;

   ORACLE_HOME specifies where ORACLE is installed
   Old setting: ORACLE_HOME=unknown
   New setting: ORACLE_HOME=/users/oracle in oracle.cfg

   ORACLE_SID selects the default ORACLE Instance to use
   Old setting: ORACLE_SID=unknown
   New setting: ORACLE_SID=SAMP in oracle.cfg
===
 - Checking DAL environment settings -
   New setting: DALDEFAULTDBMS=oracle in /etc/dalrc

   DAL specifies where DAL is installed
   Old setting: DAL=/users/dal

   Set DALLOGGING to YES to enable logging to /tmp/dalXXXXXX.log
   Old setting: DALLOGGING=NO

   Set DALDEBUG to YES to send debug info to stderr(idal) or logfile
   Old setting: DALDEBUG=NO

   DALTEMPDIR specifies where DAL creates temporary work files
   Old setting: DALTEMPDIR=/tmp

   DALMESSAGES selects the default host message language to use
   Old setting: DALMESSAGES=unknown
 ! Choose DALMESSAGES from the following: french italian us_english
 >>Please supply a new value for DALMESSAGES (us_english): <return>
   New setting: DALMESSAGES=us_english in /etc/dalrc

   DALDEFAULTDBMS selects the default DBMS server to run
   Old setting: DALDEFAULTDBMS=oracle

   Set DALSERVERLOG to YES to enable ADSP listener logging
   Old setting: DALSERVERLOG=NO
```

```
   Set DALRESTARTADSP to YES to enable autorestart of DAL adsp listener at
   boot
   Old setting: DALRESTARTADSP=unknown
 ! Choose DALRESTARTADSP from the following: NO YES
 >>Please supply a new value for DALRESTARTADSP (YES): <return>
   New setting: DALRESTARTADSP=YES in /etc/dalrc
 - Shutting down DAL adsp listener -
 - Starting up DAL adsp listener -

   DAL Server Version   DBMS Version         Networks
   ------------------   ------------------   --------------------------
   A/UX 1.4 ORACLE7     ORACLE  7.0.12.2.0   PktAsync, AppleTalk, TCP/IP

 - Successful installation -
```

DAL Server files and their purpose

This is a listing of the files installed by DALinstall and their use. Most of the files DAL installs are in the /users/dal directory, but one file is created in /etc and three files are created in /usr/bin.

The file in /etc is:

```
# ls -l /etc | grep dal
-rw-r--r--   1 dalsys   dalsys       221 Oct 26 11:29 dalrc
```

This file sets up the standard configuration for DAL, and can be modified with the DAL command as will be seen below. A typical Oracle configuration would look like this:

```
DAL=/users/dal                          (location of the DAL files)
DALFILE="$DAL/dalprocs"                 (location of the host procedures)
DALLOGGING=NO                           (session logging, YES or NO)
DALDEBUG=NO                             (debugging, YES or NO)
DALTEMPDIR=/tmp                         (where temporary files go)
DALMESSAGES=us_english                  (which message file to use)
DALDEFAULTDBMS=oracle                   (default DBMS, oracle or
                                         informix)
DALSERVERLOG=NO                         (server logging, YES or NO)
DALRESTARTADSP=YES                      (restart ADSP server on reboot)
DALDBMSLIST="oracle"                    (known DBMSes)
DALMSGLIST="french italian us_english"  (known language files for errors)
```

The three files in /usr/bin are actually links to one another:

```
# cd /usr/bin
# dir | grep dalsys
-rwxr-xr-x   3 dalsys   dalsys       216 Oct 26 11:29 DAL*
-rwxr-xr-x   3 dalsys   dalsys       216 Oct 26 11:29 dalsvr*
-rwxr-xr-x   3 dalsys   dalsys       216 Oct 26 11:29 idal*
```

DAL, dalsvr and idal all execute the same shell script:

```
#!/bin/sh
set -a
. /etc/dalrc

if [ X$1 = X-v -o X$1 = Xversions -o `basename $0` = DAL ] ; then
   cd $DAL
   . ./.dal.config
   exit
fi

case `basename $0` in
idal) EXE=idal ;;
*) EXE="" ;;
esac
. $DAL/.dalsvr.run
```

What this script does is the following: it loads in the values in /etc/dalrc and then checks the parameters. If the dalsvr entry point was used, or if it was given the parameter -v or 'versions', then it responds by executing the file $DAL/.dal.config, a shell script which will output a listing of what is available for use with DAL:

```
medraut# dalsvr

DAL Server Version    DBMS Version           Networks
------------------    --------------------   --------------------------
A/UX 1.4 ORACLE7      ORACLE   7.0.12.2.0    PktAsync, AppleTalk, TCP/IP
```

If it doesn't do that, it sets the environment variable EXE to either a null string (if the DAL command are executed) or 'idal' (if idal is executed), and then executes the file $DAL/.dalsvr.run. This starts either the DAL configuration program or the DAL server, depending on which entry point is used.

In /users/dal, we have these files:

```
medraut#  ls -lRa
total 2454
-rwxr-xr-x   1 dalsys   dalsys       216 Jun 18 01:41 .dal.cfg*
```

This is the shell script installed in /usr/bin.

```
-rwxr-xr-x   1 dalsys   dalsys      9439 Sep 28 19:02 .dal.config*
```

This is the shell script executed as /usr/bin/DAL to do configuration.

```
-rwxr-xr-x   1 dalsys   dalsys     10980 Sep 30 17:16 .dal.install*
```

This is the shell script executed by /users/dal/DALinstall or the "DAL install" command.

```
-rw-r--r--   1 dalsys   dalsys      1195 Jun 22 16:13 .dal.usage
```

A text file listing the commands for the DAL program. Listed by "DAL help".

```
-rwxr-xr-x   1 dalsys   dalsys      6832 Jun 12 20:30 .dalprocs.cfg*
A text file storing the template for the /users/dal/dalprocs file. This
is modified during installation for proper configuration..

-rwxr-xr-x   1 dalsys   dalsys       203 Sep 30 13:53 .dalrc.cfg*
A text file storing the template for the /etc/dalrc file. This is
modified during installation for proper configuration.

-rwxr-xr-x   1 dalsys   dalsys       255 Jun 12 20:52 .dalsvr.cfg*
A text file storing the template for the /users/dal/.dalsvr.run file.
This is modified during installation for proper configuration.

-rw-r--r--   1 dalsys   dalsys       253 Oct 26 11:29 .dalsvr.run
This is the shell script executed by idal to start the dal server.

-rwxr-xr-x   1 dalsys   dalsys       495 Sep 22 17:39 .informix.cfg*
A text file storing the template for the /users/dal/informix.cfg file.
This is modified during installation for proper configuration. (note:
this is installed by the Oracle install floppy, but not used).

-rwxr-xr-x   1 dalsys   dalsys       364 Jun  2 11:32 .oracle.cfg*
A text file storing the template for the /users/dal/oracle.cfg file. This
is modified during installation for proper configuration.

-rwxr-xr-x   1 dalsys   dalsys        27 Jun  9 18:41 DALinstall*
This shell script executes /users/dal/.dal.install.

-rw-r--r--   1 dalsys   dalsys         0 Oct  4 15:15 DiskCreationDate
A time stamp that documents what date/time the files on the install
floppy were created.

-rw-r--r--   1 dalsys   dalsys      8394 Oct  5 11:30 README
The latest information on the release.

-rwxr-xr-x   1 dalsys   dalsys     88476 Oct  1 17:07 dal_adsp*
The DAL 1.4 ADSP listener. This is restarted when the system boots from
/etc/inittab using the line "dall:2:once:/usr/bin/DAL boot adsp", which
should be added from the DALinstall command. Whether it is turned on or
not is controlled by the DAL command.

-rwxr-xr-x   1 dalsys   dalsys       220 Sep 22 18:08 dalbrd.sqlexec*
-rwxr-xr-x   1 dalsys   dalsys       220 Sep 22 18:06 dalbrd.sqlturbo*
These two files are installed by the Oracle install floppy, which is a
cosmetic bug in DAL 1.4. They are used to configure the Informix server
for the different versions of Informix. They are not used with Oracle.

-rwxr-xr-x   1 dalsys   dalsys      7369 Jun 24 01:12 dalprocs*
This is a text file containing the host-based DAL procedures. The
commonly used ones are documented later.

-rw-r--r--   1 dalsys   dalsys      8318 Apr 16  1993 msg.french
-rw-r--r--   1 dalsys   dalsys      7980 Apr 16  1993 msg.italian
-rw-r--r--   1 dalsys   dalsys      6121 Apr 16  1993 msg.us_english
```

These files contain the error messages for the server and are set up for easy internationalization. Note that in DAL 1.4, neither the French or Italian files are actually internationalized, so using them won't give you any advantage. They are place holders so they can be modified as appropriate by the international subsidiaries.

```
-rwxr-xr-x   1 dalsys   dalsys       367 Oct 26 11:29 oracle.cfg*
```

This file configures DAL so it can access the oracle DBMS without requiring the user's account to be configured for it.

```
-rwxr-xr-x   1 dalsys   dalsys   1073072 Oct  5 16:06 oracle.dal*
```

The DAL database adapter for Oracle.

```
-rw-r--r--   1 dalsys   dalsys       919 Sep 27 16:10 usage
```

A short text file that explains installation for people who hate reading manuals.

The data/ sub directory holds the demo tables for Informix (which would be accessed with the "USE LOCATION /users/dal/data" clause), and the script needed to create the demo tables in Oracle. Since Oracle stores all data internal to it's database structures, there are no files stored here for that DBMS.

```
drwxr-xr-x   2 dalsys   dalsys       512 Oct 26 11:28 data/
./data:
total 60
drwxr-xr-x   2 dalsys   dalsys       512 Oct 26 11:28 ./
drwxr-xr-x   3 dalsys   dalsys      1024 Oct 26 11:29 ../
-rw-r--r--   1 dalsys   dalsys       140 May 25 00:37 README.oracle
-rw-r--r--   1 dalsys   dalsys     27435 Aug 15  1991 oracle_script.sql
```

This is the end of the overview of DAL server files. The informix server is almost identical, the only changes being the added configuration scripts for the Online vs. SE database versions and the need for the separate demo tables (listed below).

Installing Oracle demo tables

This is an example of how to install Oracle demo tables. To install the demo table in Oracle, you need to log on to Oracle via the program sqldba (this assumes you are in an account configured to use Oracle. The easiest way to do this is log on to the system as user oracle).

```
% cd /users/dal/data
% sqldba

```

Using DAL

The DAL command is used to configure the server and to look at its current status. A list of the commands supported by DAL are below, and can be printed with the "DAL ?" or "DAL help" commands:

```
medraut#  DAL help
 DAL utility usage:

 DAL start [ adsp ]         ( start the adsp listener)
 DAL stop [ adsp ]          ( stop the adsp listener)
 DAL boot [ adsp ]          ( only start the lstnr if DALRESTARTADSP=YES )
```

These three commands control the ADSP listener. Boot is equivalent to start, but will only start the listener if it is configured to start on system reboot.

```
 DAL sessions                    ( list the active DAL sessions )
```

Describes the current state of the server. This is an example of the output when the server is idle:

```
medraut# DAL sessions
 - DAL adsp listener is running -
 - No DAL sessions currently running -
```

```
    This is an example of a server with one active session:

medraut# DAL
 - DAL adsp listener is running -
 - DAL sessions currently running:

    chuq 6087 289 1 13:52:37 C1 0:00 /users/dal/oracle.dal idal

 DAL config                      ( show all DAL config parameters )
    This lists the contents of /etc/dalrc

 DAL config dalrc                ( edit all parameters in /etc/dalrc )
    This command lets you change the contents of /etc/dalrc by prompting you
    for a new entry for each line (carriage return implies no change).

 DAL config <informix|oracle|ingres>    ( edit all parms for that dbms)
    This command lets you change the contents of the appropriate
    configuration file for supported databases (/users/dal/oracle.cfg for
    oracle, /users/dal/informix.cfg for informix).  Note that Ingres is not
    supported in DAL 1.4.

 DAL config all                  ( edit all DAL parms in DBMSs and dalrc )
    Allows you to configure everything about the server, prompting you as
    appropriate.

 DAL versions                ( show the versions of available DAL servers )
    Lists the currently supported databases and their versions and
    configured network adapters.  Equivalent to the "dalsvr" command.

 DAL <log|lsn>               ( run more on latest /tmp/dalxxx.log or .lsn )
                             ( you must press 'q' to exit, space for more )
 DAL purge <log|lsn>         ( remove all but the latest log/lsn tmp files)
    Prints and purges the .log (logging), .lsn (adsp listener logs) and .dbg
    (DAl debugging) logs.  Note that "DAL dbg" and "DAL purge dbg" are also
    legal options.

 DAL show  <dal env. variable>  ( show the current setting for that var )
    Shows a specific variable in /etc/dalrc.

 DAL DEFAULTDBMS=<dbms-name>    ( make that dbms the default )
    Allows you to change the default DBMS name.

 DAL DALMESSAGES=<language-name>( make that msg language the default )
    Allows you to change the language used for server error messages.

 DAL <var>=<value>         ( change any DAL environment variable )
 DAL -e <var>=<value>      ( explain each variable before prompting )
 DAL -p <var>=<value>      ( force a prompt even if value is already valid)
    Allows you to change any specific variable in /etc/dalrc. The -e option
    outputs a description of what you're changing. The -p option forces DAL
    to prompt you for the changed value.

 DAL install ...           ( run the full DAL installer for reconfig )
```

The same as the DALinstall command.

Common Dalproc procedures

The file /users/dal/dalprocs contains host-based DAL procedures. It can be used to store commonly used and shared DAL functions. DAL 1.4 ships with a set of procedures in the dalprocs file. Some of them are of interest primarily as examples, but some have more general use. The ones you might want to use include:

dal_config: prints the DAL environment from inside idal, so you can see how the server thinks it's configured.
op: opens the default DBMS and then opens the appropriate database so that the demo tables are available.
oo: opens the Oracle DBMS and database as user scott (for demo table access).
oinf: opens the Informix DBMS
closeall: closes all open databases and DBMSes.
tables: prints the name of all available tables.
columns(tablename): prints the columns for a given table.
exp: a quick validity test for the default database.

TCP/IP and Asynchronous connections

Under TCP/IP and Asynchronous connections, the DAL client logs onto the A/UX system like a normal user, and once it is connected to a shell, executes the command idal. TCP/IP makes the connection through the rexec daemon (the rsh function under BSD, the remsh function under System V), which does password checking. This assumes that the user has a valid account on the system and knows the password, and that idal is in the account's default $PATH.

A sample DAL Preferences entry for this is:

```
medraut:MacTCP:AUX:17.190.12.52
medraut:login::::3000:::
```

Medraut is the entry name (in this case, also the name of the machine), and 17.190.12.52 is the IP address for the machine. The client must have MacTCP installed for it to work.

ADSP

When connecting via ADSP, operation is very similar to TCP/IP. The ADSP listener replaces the rexec daemon and shell, doing the password validation and spawning the idal process. All server operations are handled by idal. When the user disconnects, idal exits and the network connection is closed.

A sample DAL Preferences entry for ADSP is:

```
medraut.a:atalk:Chuq's AUX box.De Anza 3/1st Floor
```

Apple Internet Router 3.0: GeoPort Compatibility (12/93)

Revised: 12/6/93
Security: Everyone

Apple Internet Router 3.0: GeoPort Compatibility (12/93)

==========

Article Created: 6 December 1993

TOPIC -----

When I use Apple Internet Router (AIR) 3.0 on my Quadra 840AV, the router runs properly. If Express Modem for Geoport is loaded, the 840AV crashes at bootup.

Are the Apple Internet Router 3.0 and the GeoPort software compatibile?

DISCUSSION -----

The Centris/Quadra AV computers require Apple Internet Router 3.0.1 when the Express Modem for GeoPort software is installed. AIR 3.0 will either crash at boot (if the router auto-starts at boot) or will crash with a "Type 3" error (if the router is manually started), when the GeoPort software has been installed on the system also.

Apple Color Printer: Canon Cartridge Part Number 12/93

==========

Article Created: 6 December 1993

TOPIC --------------------

Is there is a Canon cartridge part number that can be used with this printer?

DISCUSSION --------------------

The Canon cartridge part numbers that can be used in the Apple Color Printer are as follows:

- BJI-643 Bk (Black)
- BJI-643 C (Cyan)
- BJI-643 M (Magenta)
- BJI-643 Y (Yellow)

System 7 Pro: Font Issues with Snapshot Format (12/93)

Revised: 12/6/93
Security: Everyone

System 7 Pro: Font Issues with Snapshot Format (12/93)

==========

Article Created: 6 December 1993

TOPIC --------------------

What's supposed to happen when an AppleMail document is sent to someone in the "snapshot" format, and a font that's used on the sender's computer isn't installed on the client's computer?

Does this affect output possibilities, whether to PostScript or QuickDraw printers and fax machines?

DISCUSSION --------------------

An AppleMail snapshot creates a document in PICT format. The PICT format stores the information about the font used originally to create the document. The system that opens the document substitutes the font if the font isn't present. The result is that the recipient's document won't look like the original.

Education Resource CD: QuickTime 1.6 Install Workaround (12/93)

Revised: 12/6/93
Security: Everyone

Education Resource CD: QuickTime 1.6 Install Workaround (12/93)

==========

Article Created: 3 December 1993

TOPIC --------------------

The program on the Apple Education Resource CD that will update and/or install the QuickTime 1.6 extension isn't working correctly. It keeps the old copy of QuickTime 1.0 in the Extensions folder within the System Folder and just adds QuickTime 1.6 into the Extensions folder. The program doesn't replace the previous version of the QuickTime extension. When you restart the computer a message will appear saying that the QuickTime extension isn't available.

DISCUSSION --------------------

Remove the old QuickTime version from the Extensions folder within the System Folder to work around this.

PowerBook Batteries: Voltage Range (1/95)

Revised: 1/23/95
Security: Everyone

PowerBook Batteries: Voltage Range (1/95)

==========

Article Created: 6 December 1993
Article Reviewed/Updated: 23 January 1995

TOPIC ----------

What is the voltage range for PowerBook batteries?

DISCUSSION ----------

The voltage for PowerBook batteries varies, depending on how fully charged they are.

• The PowerBook 100 series batteries range between 5.8 volts and 7.5 volts (fully charged).

• PowerBook 200 series batteries range between 10.9 Volts and 16 volts (fully charged).

• PowerBook 500 series batteries range between 8.5 volts and 11.6 volts (fully charged).

Article Change History:
23 Jan 1995 - Added PowerBook 500 series battery voltage.

AppleShare Print Server & LW 8.x.x: Incompatibilities (12/93)

Revised: 12/23/93
Security: Everyone

AppleShare Print Server & LW 8.x.x: Incompatibilities (12/93)

==========

Article Created: 7 December 1993
Article Reviewed/Updated: 23 December 1993

TOPIC -----

This article addresses questions on AppleShare Print Server 3.0.1 and the LaserWriter 8.x.x driver.

DISCUSSION -----

Question #1

I just installed the LaserWriter 8.0 print driver on my desktop computer and on our AppleShare Print Server 3.0.1, a Macintosh IIx running System 7.1.

The installation seemed to proceed normally, and I was able to print to my LaserWriter IIf. However, when I started the AppleShare Print Server, I received the following alert dialogue box:

"The print server had trouble getting to the LaserWriter file. Please make sure the print drivers are installed correctly."

Does the LaserWriter 8.0 driver print driver not work with AppleShare Print Server 3.0.1?

Answer #1

LaserWrite 8.x.x drivers are not compatible with any of the current AppleShare Print Servers. The AppleShare Print Server 3.0.x, AppleShare Print Server 4.0.x, and AppleShare Pro Print Server 1.0 require one of LaserWriter 7.x.x drivers in the Extensions folder to work correctly. Also note that this driver must have the name "LaserWriter" to be recognized.

Question #2

When a user prints with the LaserWriter 8.0 driver to a printer captured by AppleShare Print Server 3.0.1 and System 7.1, the job creates two items in the queue, and the log shows two print jobs in the log. Why?

Answer #2

The source of this anomaly is the LaserWriter 8.x.x driver on the client Macintosh. When it prints a document, it intentionally creates two print jobs. The first job contains setup information for the printer, the second job contains the PostScript stream for the document. Naturally, the Print Server will display these as two separate print jobs. Apple currently has no plans to change this.

Question #3

I have only been able to use the "Generic" setup in LW 8.0 when printing from a workstation to a LaserWriter that has been captured by AppleShare Print Server 3.0.1. Since the LaserWriter is already captured by AppleShare Print Server, one is unable to do a printer specific configuration.

Doesn't this effectively defeat the purpose of having printer-specific PPDs, and eliminate all of the special advantages and features of LW 8.0 when you use AppleShare Print Server?

Answer #3

No, it does not. The solution here is, when choosing the printer in the Chooser, to manually select the correct PPD for your printer using the "Select PPD..." button in the "Setup" dialog. This will allow you to use any of the features of the selected printer.

Article Change History:
23 Dec 1993 - Updated to include LW Print driver 8.x.x.

Peter & Santa Claus CD: Printing Problems (12/93)

Revised: 12/7/93
Security: Everyone

Peter & Santa Claus CD: Printing Problems (12/93)

==========

Article Created: 2 December 1993

TOPIC --

1. When printing on a StyleWriter II, why does an alert appear saying that an unknown error occurred?

2. My document won't print, any suggestions?

DISCUSSION --

1. You may have background printing turned on. It is known that background printing may cause an error. Try turning background printing off via the Chooser which is located under the Apple Menu.

2. Check the following:
   - Ensure that you have selected a printer in Chooser.
   - Ensure that the printer is turned on.
   - Ensure that the printer is properly connected to your Macintosh.
   - Ensure that there is paper in the printer.
   - If there is not enough memory available to print while the application is running, then the document will not be printed until Peter and Santa Claus is quit.

Peter & Santa Claus CD: Memory Alerts (12/93)

Revised: 12/7/93
Security: Everyone

Peter & Santa Claus CD: Memory Alerts (12/93)

==========

Article Created: 7 December 1993

TOPIC --

1: When trying to run Peter & Santa Claus, why does an alert
appear saying that there's not enough memory?

2: Why do I get an alert saying, "The application 'Peter and Santa Claus
has unexpectedly quit (out of system memory)?"

DISCUSSION --

Answer to Question 1:
- Ensure that there is enough memory available by choosing "About This Macintosh" from the Apple Menu and examining your largest unused block. Peter & Santa Claus requires at least 2300K of memory to run.
- Remove any extensions or control panels that create a low memory situation in the background (such as background compression utilities). This will decrease the amount of memory used by your system software and allow more memory for your CD application.
- If using Virtual Memory, restart the CPU to ensure that memory is not fragmented.
- Close all windows in Finder.
- Quit any running applications.
- If you still do not have enough memory, you may want to consider purchasing more.

Answer to Question 2:
- If you are running under System 6.0.7 MultiFinder and do not have over 5MB of memory available, you will receive this alert.
- Peter and Santa Claus will run properly on a 4MB CPU if you switch over to Finder instead of MultiFinder.

Peter & Santa Claus CD: CD Not Seen on Desktop (12/93)

==========

Article Created: 2 December 1993

TOPIC -----

Why can’t I see the Peter & Santa Claus CD on my Desktop?

DISCUSSION -----

One of the following may help you solve your problem:

1) Ensure that your CD-ROM drive is turned on & plugged into an active electrical outlet.

2) Ensure the CD-ROM drive’s SCSI connection is properly connected to your Macintosh (see your CD-ROM drive’s manual for instructions).

3) Ensure the CD-ROM drive’s SCSI ID does not conflict with another SCSI device’s ID number (consult your CD-ROM drive’s manual for further information).

4) Ensure all CD-ROM drivers are installed.

5) Ensure the CD-ROM drive has been turned on before the Macintosh has been turned on (with the CD-ROM Player turned on restart your Macintosh).

6) Try to use another CD-ROM. This will narrow down the problem to either the set-up or the CD-ROM disc. It is highly unlikely that the problem involves the disc.

PowerBook Models 14x, 16x, 170, 18x: Common Q & A (5/95)

Revised: 2/17/97
Security: Everyone

PowerBook Models 14x, 16x, 170, 18x: Common Q & A (5/95)

==========

Article Created: 7 December 1993
Article Reviewed/Updated: 15 May 1995

TOPIC ----------

This article describes common questions and answers compiled by the PowerBook support team in the Apple Assistance Center. It is also available through the Apple FaxInfo system.

DISCUSSION ----------

Question: When I press the power button, my PowerBook does not start up, or flashes the display momentarily.

Answer: Follow the procedure detailed below:

1) Plug in the AC Adapter. If unit will start with the AC Adapter, but not with the battery in the compartment, you probably need to charge the battery. Another possibility is that you may need a new battery.

2) Reset the power management circuitry. This condition can be temporary, and this fix may be all you need. A separate Tech Info Library article details how to do this with various PowerBook and Duo models.

3) If the machine won't start with a recharged or new battery, or won't start with AC Adapter without a battery, then your PowerBook may need servicing. Please call 1-800-SOS-APPL or see your local Apple Authorized Service Provider.

Question: I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen.

Answer: Make sure you’re using the correct cable, as it appears you have SCSI disk mode enabled. Use the Apple SCSI System Cable, part number: M2538LL/A, and appropriate SCSI termination.

Question: I’m trying to connect my PowerBook as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number.

Answer: You may have the wrong cable. Use the Apple HDI-30 SCSI disk adapter cable, part number M2539LL/A, in conjunction with an Apple SCSI System Cable appropriate to your other Macintosh along with proper SCSI termination. Please refer to the Apple FaxInfo article on SCSI or refer to Chapter 14 in the User's Guide: "Expanding Your Computer System."

NOTE: SCSI Disk Mode is NOT supported on the following PowerBook models: 140, 145, 145B, 150, and 170.

Question: My battery lasts only a very short time. What can I do?

Answer: Follow the procedure detailed below.

1) Reset the power manager, following the procedure detailed in the first Q and A in this document.

2) Let the battery charge for 8 hours. This procedure should resolve the problem.

3) A few words about ongoing battery care: Completely discharge the battery after approximately 15 to 20 recharges. Here's how to do this:

Let the battery discharge completely until the PowerBook goes into sleep mode. You’ll see three battery warning dialog boxes before this occurs. This process will “recycle” the nickel cadmium (NiCad) battery and eliminate a “memory effect,” which makes the battery appear depleted when it is not.

Question: When starting up, my PowerBook displays the Fax Modem extension icon with an "X" through it. I can’t use my modem to send a fax.

Answer: Open the Preferences folder inside your System Folder and trash the Fax Preferences file, empty the Trash, and restart your PowerBook. The Fax preference file can be corrupted due to a system error or screen freeze, disabling the Fax Modem extension as a result.

Apple recommends using Express Modem software 1.0.4 or later to permanently resolve this problem. Contact your local dealer or call 1-800-SOS-APPL to receive a copy.

Question: My PowerBook 140, 145, 160, or 165 display is blurry or displaying shadowing and ghosting effects. What can I do?

Answer: Open the Monitors control panel and select "Black & White" instead of 16 Shades of Gray. The type of screen technology used on these PowerBook models is

susceptible to shadowing and ghosting, since it doesn't individually address each pixel on the display. These effects are less noticeable in Black & White mode, but cannot be eliminated completely.

You can also try adjusting your brightness and contrast controls to minimize the effect.

Question: How can I get the smiling Macintosh icon (often called "Happy Mac") and the "Welcome to Macintosh" dialog box displayed at startup on my external monitor?

Answer: Open the Monitors control panel, hold down the option key and drag the "Happy Mac" icon which appears to monitor image marked 2. After you restart your PowerBook, the icon and dialog box will appear on your external monitor.

Question: My external monitor is not displaying an image when I start up my PowerBook.

Answer: Follow this procedure:

1) Make sure the video cable connected to both the PowerBook video port and the Monitor video port is secure.

2) Make sure the PowerBook is plugged into the AC Adapter, which is required to use an external monitor.

3) Open the Monitors control panel. You should see images of two monitors, representing the PowerBook display and the external monitor. If don't see the image of the external monitor, repeat steps 1 and 2.

4) In the Monitors control panel, click (and hold) the "Identify" button. A large 2 should be displayed on the external monitor icon.

Tip: If you wish to use the External monitor as your primary monitor, open the Monitors control panel and drag the menu bar image from the internal to the external monitor. The menu bar will be displayed on the external monitor once you restart the PowerBook.

Question: How much does an All-In-One PowerBook weigh?

Answer: All in One PowerBook computers (any PowerBook model with a built in floppy disk drive) weigh 6.8 pounds. The PowerBook 150 weighs 4.5 pounds.

Question: What features are included in an All in One PowerBook?

Answer: All-In-One PowerBook computers (any PowerBook model with a built in floppy disk drive) all have the following features:

• ADB port (for external mouse or keyboard)

- Built-in floppy drive
- External SCSI port
- Internal modem slot
- Microphone port
- Speaker port
- Two serial ports, except the PowerBook 150 (one supports LocalTalk)

Additionally, PowerBook models 160, 165 and 180 have:

- Built-in microphone (The grill located beneath the display.)
- Video out port
- SCSI Disk Mode. SCSI Disk Mode allows you to attach the PowerBook via a special cable to another Macintosh. The PowerBook then appears on the other Macintosh desktop as an external hard disk.

Question: What is a System Enabler, why do I need it, and which version should I use?

Answer: A System Enabler provides system software code for your specific PowerBook to work with System Software. It is required and must be located in your system folder to function. A number of different system enablers have been released:

- System Enabler 111 was released with PowerBook models 160 and 180.
- System Enabler 121 was released with PowerBook model 165c.
- System Enabler 131 was released with PowerBook model 180c.

Additionally, System Enabler 131 supports all PowerBook models listed above. The current version of system enabler 131 is 1.0.3, but this is subject to change.

PowerBook models 100, 140, 145, and 170 do not require a System Enabler, regardless of the system software version they use.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
15 May 1995 - Added PowerBook 145B to list of PowerBook computers that do not support SCSI Disk mode.
31 Mar 1995 - Reviewed for technical accuracy, revised formatting again.
08 Feb 1995 - Reviewed for technical accuracy, revised formatting.

HyperCard: Script to Convert Dollar Amounts to Words (7/92)

==========

Article Created: 16 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Handler Name: dollarsToWords,numToStr,upperCase

This function converts a number of dollars into words, just as you do when writing a check. Try this: answer dollarsToWords(1234567.89)

DISCUSSION --------------------

```
function dollarsToWords num
  get offset(".",num) -- any cents?
  if it <> 0 then put return into char it of num
  put line 1 of num into dollars
  put line 2 of num into cents
  put numToStr(dollars) into result
  put upperCase(char 1 of result) into char 1 of result
  if cents > 0 then put " and " & cents & "/100" after result
  return result
end dollarsToWords

function numToStr num
  put empty into result

  -- trillions, billions, millions, thousands
  repeat with i = 1 to 4
    put length(num) - (15-3*i) into lastDigit
    if lastDigit <= 0 then next repeat
    put char 1 to lastDigit of num into thisNum
    delete char 1 to lastDigit of num
    if thisNum = 0 then next repeat
    put numToStr(thisNum) after result
    put item i of " trillion, billion, million, thousand" after result
    if num = 0 then return result
```

```
    put ", " after result
  end repeat

  -- hundreds
  if num > 99 then
    put numToStr(char 1 of num) & " hundred" after result
    delete char 1 of num
    if num = 0 then return result
    put " " after result
  else if char 1 of num is 0 then delete char 1 of num

  put "twen,thir,four,fif,six,seven,eigh,nine" into prefixes

  -- twenty..ninety
  if num > 19 then
    put item (char 1 of num) - 1 of prefixes & "ty" after result
    delete char 1 of num
    if num = 0 then return result
    put "-" after result
  end if

  -- thirteen..nineteen
  if num > 12 then
    put item num - 11 of prefixes & "teen" after result
    return result
  end if

  -- zero..twelve
  return result & item num + 1 of ¬
  "zero,one,two,three,four,five,six,seven,eight,nine,ten,eleven,twelve"
end numToStr

function upperCase ch
  get charToNum(ch)
  if it < 97 then return ch
  else return numToChar(it - 32)
end upperCase
```

HyperCard: Behavior of Click Command (7/92)

==========

Article Created: 6 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --

There might be a circumstance when HyperCard users set the lockscreen to true, scroll a field, and then click at a location that they think will be a line not currently visible.

This does not work. Next they might try and do the same thing without the lockscreen set to true, and it does work. What's going on?

DISCUSSION --

The click command works only on a REAL screen location rather than an intended one.

In the situation given, HyperCard does store the scroll of the screen in an internal data structure, but it is not available with the click command because it can't access internal data structures -- only the actual screen location. Therefore, try unlocking the screen before clicking at the new location.

HyperCard: How to Find the Center of a Rectangle (7/92)

==========

Article Created: 16 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

This little utility script is used to find the point that's at the center of a rectangle.

DISCUSSION --------------------

```
function centerOfRect rect
  put item 3 of rect - item 1 of rect into width
  put item 4 of rect - item 2 of rect into height
  return round(item 1 of rect+width/2)&","&round(item 2 of rect + height/2)
end centerOfRect
```

HyperCard Correction: Globals Retained After Open Command (7/93)

Revised: 12/8/93
Security: Everyone

HyperCard Correction: Globals Retained After Open Command (7/93)

==========

Article Created: 8 July 1993

TOPIC ----------

It is written that "When you quit the application you go to the card you were on in HyperCard when you executed the Open command. However, any global variables you had previously declared are now gone, and any portions of handlers that remained unfinished when you executed the open command do not finish."

This is not entirely true.

DISCUSSION ----------

Portions of handlers following the Open command will continue to execute in the background. Global variables are retained after quitting an application launched with the Open command.

HyperCard: Script to Go Back to Previous Stack (7/92)

==========

Article Created: 16 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

The handler GoBackStack takes you back to the stack you were in before the current one. It uses information that is saved by rememberStack.

RememberStack is called from the closeStack handler in this stack. That means you can only go back to stacks that pass closeStack, so make sure all your favorite stacks do so.

DISCUSSION --------------------

```
on rememberStack
  global backTrackStacks
  get short name of this stack
  if it is not last line of backTrackStacks -- prevent consecutive duplicates
  then put it & return after backTrackStacks
end rememberStack

on goBackStack
  global backTrackStacks
  get backTrackStacks
  put last line of it into dest
  delete last line of it
  if dest is empty then go home else go to stack dest
  put it into backTrackStacks -- global changed during go
end goBackStack
```

HyperCard 2.0: Conflict with Icon Wrap INIT (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard 2.0: Conflict with Icon Wrap INIT (7/92)

==========

Article Created: 29 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

HyperCard 2.0 crashes when the down-arrow key is pressed.

DISCUSSION ----------

This could be due to a conflict between HyperCard and an INIT called Icon Wrap. If so, remove the INIT, then restart the computer.

Icon Wrap patches a ROM routine called CopyBits, and stays around after loading. A newer version of Icon Wrap solves the problem.

HyperCard: Script for Importing Comma-Separated Text (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard: Script for Importing Comma-Separated Text (7/92)

==========

Article Created: 4 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

This article provides a script that will import a comma-separated text file into HyperCard. It assumes that:

- There is a comma between fields.
- There is a return between records.
- If a field itself contains a comma, then the field has quote marks around (though it will work just as well if ALL fields have quotes around them).

DISCUSSION ----------

```
on mouseUp
  answer file "Import from which file?" of type text
  if it is empty then exit mouseUp
  put it into fileName
  open file fileName
  go to last card
  repeat forever

    read from file fileName until return
    if it is   empty then
      go to first card
      close file fileName
      exit mouseUp
    else
      doMenu "New Card"
      put "," into last char of it
    end if

    repeat with x=1 to the number of fields
      if char 1 of it is quote then
        put char 2 to offset(quote&",",it) - 1 of it into field x
        delete char 1 to offset(quote&",",it) of it
```

```
      else
        put char 1 to offset (",",it) - 1 of it into field x
        delete char 1 to offset (",",it) of it
      end if

    end repeat
  end repeat
end mouseUp
```

HyperCard: Importing Tab-Separated Text (8/93)

Revised: 12/8/93
Security: Everyone

HyperCard: Importing Tab-Separated Text (8/93)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 3 August 1993

TOPIC --------------------

Here is a simple script that will import tab-separated text into a HyperCard 2.1 stack.

DISCUSSION --------------------

```
on mouseUp
  answer file "Choose the file to import" of type TEXT
  if it is empty then exit mouseUp
  put it into fileName
  open file fileName
  repeat
    read from file fileName until return
    if it is empty then
      close file fileName
      answer "Your data has been imported."
      exit mouseUp
    end if
    doMenu "New Card"
    put it into oneRecord
    set the itemDelimiter to tab
    repeat with i = 1 to the number of fields
      put item i of oneRecord into bg fld i
    end repeat
  end repeat
end mouseUp
```

Note: The script will not work with earlier versions of HyperCard because it relies on the new ItemDelimiter property.

HyperCard: Disabling Option-Tab Key Combination (9/93)

Revised: 12/8/93
Security: Everyone

HyperCard: Disabling Option-Tab Key Combination (9/93)

==========

Article Created: 23 September 1993

TOPIC --------------------

How can I disable the keyboard shortcut (Option-Tab) for opening and closing HyperCard's Tools palette?

DISCUSSION --------------------

Here's a handler that does it:

```
on KeyDown TheKey
  if theKey = Tab and the optionKey is down then
    exit keydown
  else
    pass keydown
  end if
end KeyDown
```

By including this handler in your stack script, as part of simple error checking, this will prevent anyone from accidentally hitting the keys to activate the Tool palette.

HyperCard: Printing Problem to Kodak Diconix (8/93)

Revised: 12/8/93
Security: Everyone

HyperCard: Printing Problem to Kodak Diconix (8/93)

==========

Article Created: 6 July 1993
Article Reviewed/Updated: 2 August 1993

TOPIC --------------------

My stack has a simple "Print Report" command in a custom menu. This menu item will not print to a Kodak Diconix 180si ink-jet printer from HyperCard 2.1, even though it prints fine to standard Apple printers.

DISCUSSION --------------------

The stack will print to the Diconix if "Print Report" is chosen from the File menu. This represents a probable incompatibility between the Diconix driver and HyperCard. Kodak is aware of this problem. HyperCard is not certified with the Diconix printer.

Security: Everyone

HyperCard: Moving Icons Between Stacks (7/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

This article describes how to copy icons from one stack to another.

DISCUSSION ----------

- If you understand ResEdit, you can use it to move an icon from one stack to another.

- An easier method is to use ResCopy, an XCMD available on many online services and from user groups.

- The Power Tools stack contains a card that copies resources.

- If you have none of the above, choose the Button tool while inside the stack with the icon you want to copy. Click on the button with that icon, and choose Button from the Edit menu. Go to the stack where you'd like to install the button, and choose Button from the Edit menu. The icon resource will be moved along with the button.

HyperCard 2.0v2, Oracle, and Home Stack Versions (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard 2.0v2, Oracle, and Home Stack Versions (7/92)

==========

Article Created: 23 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

The 2.0v.2 Home stack should be used with HyperCard 2.0v.2. The two must run hand-in-hand. Some of the bug fixes from 2.0v.1 to 2.0v.2 contained fixes to the application and the Home stack as well. The same is true of 2.1.

DISCUSSION ----------

This may be a particular problem for Oracle users. Oracle is a mainframe database application that uses HyperCard as an interface or "front-end" for the Macintosh. Installation of the Oracle XCMDs modifies the Home stack.

Oracle users have reported that when they use the Home stack from an older version of HyperCard with HyperCard 2.0, their application slows down considerably.

HyperCard Player: Out of Memory Error or Window Resize (9/93)

Revised: 12/8/93
Security: Everyone

HyperCard Player: Out of Memory Error or Window Resize (9/93)

==========

Article Created: 2 September 1993

TOPIC --------------------

In the Development Kit version of HyperCard 2.x, the handle to an XCMD is only locked when the XCMD is executed. After the XCMD has executed, its handle is unlocked so the memory manager can move the XCMD if it needs to.

DISCUSSION --------------------

The HyperCard Player, however, does not unlock the handle after executing the code. This can result in serious memory fragmentation. The two most common symptoms of this problem are:

- out of memory message
- a stack opened in a new window opens at less than its normal size, which brings up the scroll box.

Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Both the Palette XCMD and the Picture XCMD -- and now the Movie XCMD -- will send a message to the current card signaling that a window is closing. These messages are, respectively, closePalette, closePicture, and closeMovie.

The parameters sent with the message identify the window that is closing: The first parameter is the window's name and the second parameter is the window's ID (window IDs are new in HyperCard 2.1). The message is sent when the window closes, either via a click in a close box, or by executing a "close window" statement.

DISCUSSION --------------------

Stack designers can define a closePalette, closePicture, or closeMovie handler to take care of any cleaning up or updating when a window is closed.

One restriction: Don't try to close the window again within a closePalette, closePicture, or closeMovie handler. The script can STILL refer to the window, for example, getting (or even setting) the window's location. The script can also close other windows -- but HyperCard will crash if the script tries to close the window (e.g., close window id (the param of 2)).

HyperCard: Script to Sort Multiple Lines (7/92)

==========

Article Created: 16 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Handler Name: quickSort, bubbleSort, merge

This handler, called QuickSort, takes a multiple-line expression and sorts it into ascending alphabetical order.

DISCUSSION ----------

```
function quickSort data
  put number of lines in data into lineCount
  if lineCount <= 10 then return bubbleSort(data)
  return merge(quickSort(line 1 to lineCount div 2 of data),¬
  quickSort(line lineCount div 2 + 1 to lineCount of data))
end quickSort

function bubbleSort data
  repeat with i = 1 to the number of lines in data
    repeat with j = i to the number of lines in data
      if line i of data > line j of data then
        get line j of data
        put line i of data into line j of data
        put it into line i of data
      end if
    end repeat
  end repeat
  return data
end bubbleSort

function merge list1,list2
  put empty into resultList
  put 1 into ptr1
  put 1 into ptr2
```

```
  put number of lines in list1 into lineCount1
  put number of lines in list2 into lineCount2
  repeat until ptr1 > lineCount1 and ptr2 > lineCount2
    if ptr1 > lineCount1 then -- use list2
      put line ptr2 of list2 & return after resultList
      add 1 to ptr2
    else if ptr2 > lineCount2 then -- use list1
      put line ptr1 of list1 & return after resultList
      add 1 to ptr1
    else if line ptr1 of list1 < line ptr2 of list2 then
      put line ptr1 of list1 & return after resultList
      add 1 to ptr1
    else
      put line ptr2 of list2 & return after resultList
      add 1 to ptr2
    end if
  end repeat
  return resultList
end merge
```

HyperCard: Handler to Select Multiple Objects (7/92)

==========

Article Created: 11 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

This handler allows you to select multiple parts (buttons and fields) by specifying the rectangle that contains them. After you've selected them, you can perform operations on all of them using alignParts, deleteParts, offsetParts, and pasteParts.

DISCUSSION --------------------

```
on rectSelectParts
  -- Group selection by specifying a rectangle.
  -- Select a group of parts by clicking at topLeft and bottomRight
  -- of enclosing rectangle.

  global selectedParts,selectedPartsCard
  put empty into selectedParts
  put long name of this card into selectedPartsCard
  put "Click at top left..."
  wait until the mouseClick
  put the clickLoc into topLeft
  put "Click at bottom right..."
  wait until the mouseClick
  put the clickLoc into botRight
  put topLeft & "," & botRight into selectionRect
  repeat with i = 1 to the number of buttons
    if loc of button i is within selectionRect
    then put "card button id " & id of button i & return after selectedParts
  end repeat
  repeat with i = 1 to the number of bkgnd buttons
    if loc of bkgnd button i is within selectionRect
    then put "bg btn id " & id of bg btn i & return after selectedParts
  end repeat
  repeat with i = 1 to the number of fields
```

```
    if loc of field i is within selectionRect
    then put "bkgnd field id " & id of field i & return after selectedParts
  end repeat
  repeat with i = 1 to the number of card fields
    if loc of card field i is within selectionRect
    then put "card field id " & id of card field i & return after selectedParts
  end repeat
  put the number of lines in selectedParts & " parts selected."
end rectSelectParts
```

HyperCard 1.2.5: The Repair Stack (8/92)

Revised: 12/8/93
Security: Everyone

HyperCard 1.2.5: The Repair Stack (8/92)

==========

Article Created: 12 December 1990
Article Reviewed/Updated: 28 August 1992

TOPIC --------------------

Some HyperCard 1.2.5 stacks can become damaged in a way that lets you view all but a few "broken" cards in the stack. When you try to go to a damaged card, you could get the error "Unknown Error 5534" or something similar. These stacks will not convert well into HyperCard 2.0, if they can be opened at all.

DISCUSSION --------------------

There is no way for you to recover the information in the damaged cards. But you might be able to discard the damaged cards and create a new stack that works properly.

Two years ago, Apple Computer released a simple utility, named Recover, that lets you try to salvage the good cards in the stack. It works by copying cards one by one into a new stack, and skipping bad cards.

This utility is available from GEnie, CompuServe, and user groups.

HyperCard: Automatically Returning to First Card on Idle (4/93)

==========

Article Created: 8 March 1993
Article Reviewed/Updated: 13 April 1993

TOPIC ----------

I'm writing a HyperCard stack to control a directory kiosk for our museum. I would like to have the program automatically return to the first screen if it has not been used for over 30 seconds. How would I go about adding this feature to my stack?"

DISCUSSION ----------

Here is one way to implement this feature. The following script will automatically return to the first card in a stack when it has remained on any card for more than 30 seconds and the mouse has not moved. If you are performing some operations and you would like to reset the time manually, you can call the resetTime handler which has the same affect as moving the cursor. The time will be automatically reset when the user goes to a new card so it is not necessary to reset the time when going to a new card.

Put this code in a stack or background script:

```
  on openCard
    global startTime, cursorLoc
    put the long time into startTime
    convert startTime to seconds
    put the mouseLoc into cursorLoc
  end openCard

  on idle
    global startTime, cursorLoc
    -- Change the next line to set your time limit.
    put 30 into timeLimit
    -- Change the next line to set the return card number.
    put 1 into returnCard
    put the mouseLoc into currentLoc
```

```
    if cursorLoc <> currentLoc then
      put currentLoc into cursorLoc
      resetTime
    end if
    put the long time into endTime
    convert endTime to seconds
    if (endTime - startTime) > timeLimit then
      if the number of this card <> returnCard then
        go to card returnCard
      end if
      resetTime
    end if
  end idle

  on resetTime
    global startTime
    put the long time into startTime
    convert startTime to seconds
  end resetTime
```

HyperCard 2.1: Stacks Reverting/Defaulting to Userlevel 2 (7/92)

Revised: 12/8/93
Security: Everyone

HyperCard 2.1: Stacks Reverting/Defaulting to Userlevel 2 (7/92)

==========

Article Created: 6 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

The HyperCard binary is automatically set to start up at userlevel 2 in all versions being distributed at this date (Lite, Upgrade, Development Kit).

In the Upgrade and the Development Kit versions, the userlevel is changed by an "on Startup" script in the home card.

DISCUSSION ----------

If you try to start HyperCard by double-clicking a stack of your creation from the Finder, it will start up at userlevel 2, even though you have gone into the Home card during a previous session and changed the userlevel to 5. As a matter of fact, if you go back to the Home card after having done this, the userlevel will be reset to 2.

This will happen if you create an "on Startup" script in your new stack and fail to add a "pass startup" command in the script. Without the "pass startup" command, the Home card never receives the message it needs to invoke the script to set the userlevel to 5. As a result, the userlevel goes to the default userlevel 2. By adding the "pass startup" command everything should work OK.

HyperCard: doMenu with Shift or Command Key (7/92)

==========

Article Created: 13 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Although HyperCard does not directly support invoking menu commands that involve keyboard modifiers (Shift and Command, for example) there are ways to circumvent this limitation via HyperTalk. This article provides some sample handlers.

DISCUSSION --------------------

This handler does the same thing as choosing Paste from the Edit menu:

```
on mouseUp
  type "v" with commandKey
end mouseup
```

This handler does the same thing as choosing Cut from the Edit menu:

```
on mouseUp
  type "x" with commandKey
end mouseup
```

This handler does the same thing as choosing Copy from the Edit menu:

```
on mouseUp
  type "c" with commandKey
end mouseup
```

To invoke menu commands which involve keyboard modifiers, you would write a script like this one, which does Shift-Command-Paste:

```
on mouseUp
  type "v" with commandKey,shiftKey
end mouseup
```

HyperCard: Varying Script Speed to Match Processor Speed (4/93)

==========

Article Created: 13 February 1991
Article Reviewed/Updated: 19 April 1993

TOPIC --------------------

Because the various Macintosh models operate at different clock speeds, some HyperTalk scripts may not execute correctly.

This is especially true regarding visual effects, animated icons, animations in general, searches, going to various cards, etc. And with each new Macintosh varying in speed and performance, the art of writing a "universal" HyperCard script that execute at various speeds depending on the CPU is getting trickier.

This article provides a handler that varies the execution of HyperTalk scripts depending on the CPU.

DISCUSSION --------------------

```
on determineTiming
   global fastCPU
   put the ticks into startTicks
   repeat with i = 1 to 50
   put i into tempCounter
   end repeat
   put the ticks into endTicks
   if endTicks - startTicks < 40 then
      put true into fastCPU
   else
      put false into fastCPU
   end if
end determineTiming
```

You can also add a line such as:

```
  if CPUSpeed then wait 10 ticks
```

This will delay the execution of the script for 1/6 second. Remember to declare the fastCPU global in any handlers that use it.

HyperCard Player: Standalone Application & VIREX 3.2 (8/93)

Revised: 12/8/93
Security: Everyone

HyperCard Player: Standalone Application & VIREX 3.2 (8/93)

==========

Article Created: 6 July 1993
Article Reviewed/Updated: 2 August 1993

TOPIC ----------

Having VIREX 3.2 installed when trying to create a standalone application using the Embedding Tool (in the Player Tools stack which accompanies the HyperCard Developer's Licensing Kit) causes problems when opening the standalone.

DISCUSSION ----------

The standalone application asks "Where is Home?" (the Home stack should actually be the embedded stack).

If there is a stack named "Home" in the same folder, the standalone will open that "Home" instead of showing the embedded stack.

SOLUTION: The problem did not occur using VIREX 3.9.

HyperCard 2.x: Visual Effects Between Stacks (7/92)

==========

Article Created: 6 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

One problem with using visual effects in HyperCard 2.0 is that they don't work if you try to use a visual between two stacks of different sizes. This article provides a workaround.

DISCUSSION ----------

Create a card as the last card in stack A. This card can be either all black, all white, or the same background as the rest of the stack with blank field data.

To get the visual effect to work, the script would read:

```
on mouseUp
  visual effect -- whatever
  go last card -- of stack A
  go stack B
end mouseUp
```

The visual effect works because it is going between two cards in the same stack, and then the change to the new stack appears to occur instantaneously after the visual. If the last card created is a solid color, it will give the appearance of a "fade to black or white" or open to "white or black" and can work really dramatically.

If the last card has the same background, it will look like the data from the fields disappears and then you're in stack B.

HyperCard Through 2.1: "Word 3 to 1" Correction (7/92)

==========

Article Created: 28 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

The next to last paragraph on Page 116 of the Script Language Guide states that

> When the first number in a range is greater than the second, you get an empty string. For example, char 5 to 3 of "Motorcycle" yields "" or empty.

DISCUSSION --------------------

This holds true for char, but not for word. For example, word 2 to 1 of "Motorcycle gang" yields "gang", not empty.

This applies to HyperCard versions 1.x through 2.1.

ImageWriter II: Cable for Network (12/93)

Revised: 12/10/93
Security: Everyone

ImageWriter II: Cable for Network (12/93)

==========

Article Created: 10 December 1993

TOPIC -----

I want to connect (network) two Macintosh Computers, so they will be able to share files. Is it okay to use a DIN-8 serial cable, to connect the two computers?

DISCUSSION -----

In theory it will work. However there are several known cases where it does not. The recommendation is to NOT use it.

PowerBook Control Panel: Adapting to Power Source (12/93)

Revised: 7/8/94
Security: Everyone

PowerBook Control Panel: Adapting to Power Source (12/93)

==========

Article Created: 22 December 1993

TOPIC ----------

In the PowerBook control panel (System 7.1), what happens to the Battery Conservation Options when the system is connected to a power supply?

For instance, if the Processor Speed is set to Reduced Speed, will it still operate on reduced speed even with the PowerBook plugged in?

DISCUSSION ----------

Battery conservation options of early versions of the PowerBook control panel do not adjust according to whether the PowerBook is connected to a power supply.

Beginning with version 7.2 of the PowerBook control panel, you can adjust the settings depending on whether the PowerBook is using the AC power adapter or the battery. Version 7.2 ships with the PowerBook 250 and PowerBook 270c, and is compatible with all PowerBooks.

Duo & Duo Dock: Frequently Asked Questions (4/97)

Revised: 4/4/97
Security: Everyone

Duo & Duo Dock: Frequently Asked Questions (4/97)

==========

Article Created: 8 December 1993
Article Reviewed/Updated: 04 April 1997

TOPIC ----------

This article lists frequently asked questions (FAQ) and answers on the PowerBook 200 series computers. All information was compiled by the PowerBook Support Group in the Apple Assistance Center. This article is also available from the Apple FaxInfo system.

Questions answered in this FAQ:
==========

1) What does the switch on the battery do?

2) Can I remove the battery while the machine is on?

3) Is the battery recharged if the PowerBook is turned on or in sleep mode?

4) What is the shelf life of a fully charged battery?

5) How do I reset the PowerBook? I cannot find a reset button.

6) I have lost the keys to my Duo Dock, where can I get replacement keys?

7) Do I need a screen saver for my machine?

8) How do I clean the trackball?

9) Can I move the machine while it is on?

10) Can I put my machine through the scanning machine at the airport?

11) Can I use my PowerBook Duo overseas?

12) Can I upgrade my PowerBook Duo memory myself?

13) Can I install a modem myself?

14) My PowerBook Duo will not startup. What can I do?

15) My PowerBook will not go into sleep mode on its own.

16) After installing AppleTalk Remote Access, I get a message that AppleTalk Remote Access is not installed correctly.

17) When do I rebuild the desktop and how do I do it?

18) Can I use the Duo in SCSI Disk Mode?

19) Which cable do I need if I want to hook up a SCSI device to my Duo?

20) How do I zap the PRAM?

21) The space bar does not register at times especially if I am typing very quickly.

22) My Duo does not dock with a floppy drive adapter or MiniDock.

23) My Duo does not undock from the floppy drive adapter or MiniDock.

24) My Duo will not dock in the Duo Dock.

25) My Duo does not startup in the Duo Dock.

26) The Duo Dock display does not come on.

27) When using the Duo in the dock, the machine defaults to the top icon or item in any menu bar or window.

28) I cannot print.

29) I cannot print to the serial printer from the modem port

30) I can not print to my StyleWriter II printer.

31) Can the Duo be inserted into the Duo Dock while in sleep mode?

DISCUSSION ----------

SECTION I: General Duo Questions and Issues
==========

1) Question: What does the switch on the battery do?

Answer: The switch is simply a way to help remind you if the battery is charged or not.

2) Question: Can I remove the battery while the machine is on?

Answer: You can remove the battery if the PowerBook AC Adapter is plugged in. Apple recommends reinserting another battery as soon as possible, since dirt or other foreign materials may enter the battery cavity and damage the battery contacts.

3) Question: Is the battery recharged if the PowerBook is turned on or in sleep mode?

Answer: The battery is recharged whenever the PowerBook is plugged into the AC Adapter. The recharge rate is slower when the PowerBook is in use versus turned off. A fully depleted battery takes two to three hours to recharge if the PowerBook is turned off.

4) Question: What is the shelf life of a fully charged battery?

Answer: A fully charged Duo battery loses approximately half of its charge over the course of a month if it is not used. The warmer the storage conditions, the faster the rate of discharge.

5) Question: How do I reset the PowerBook? I cannot find a reset button.

Answer: To restart (Reset), hold down the Command, Control, and Power keys. To Interrupt, hold down the Command and Power keys.

6) Question: I have lost the keys to my Duo Dock, where can I get replacement keys?

Answer: If you still have one key or have the key number, contact:

Fort Lock Corporation
3000 N. River Road
River Grove, IL 60171
Telephone: 708-456-1100

Be sure to include the code number printed on the tag that came with the keys.

If the keys are both missing and you do not have the key number, Apple must replace the lock and provide new keys. Contact your local reseller, they can order the part and install it for you.

7) Question: Do I need a screen saver for my machine?

Answer: A screen saver is not usually required on a PowerBook Duo as the LCD is less susceptible to burning in an image. If the image on the display seems to have left a shadow from displaying the same image for several hours, turn the

PowerBook off for several hours. This lets the image fade. To help conserve battery life and minimize the possibility of temporarily developing a burned in image, enable the screen dimming feature in the PowerBook Display control panel.

8) Question: How do I clean the trackball?

Answer: Turn the retainer ring 1/4 turn counter-clock-wise (Unscrew). Do not use any liquids in the trackball assembly. Locate the two rollers, one at 6 o'clock and another at 9 o'clock. These should be free from lint and debris. Clean them by scratching horizontally with a fingernail, business card or soft cotton swab. Also clean the three bearings at 11, 4, and 7 o'clock. Clean the Trackball itself with a cotton cloth (Shirt tail or denim pants work well).

9) Question: Can I move the machine while it is on?

Answer: Yes, but be sure the hard drive is not spinning (such as when saving or opening a document.) It is best to put the PowerBook to sleep before moving it, that way you can be certain that the hard drive has been parked and will not be damaged due to motion. If traveling long distances, it is best to turn the PowerBook off just as a precaution.

10) Question: Can I put my machine through the scanning machine at the airport?

Answer: Yes, it does not affect the contents of your hard drive. Just make sure that the person behind you does not put a heavy bag on your PowerBook carrying case!

A few more tips for traveling:

- Always have current backup of your hard disk.
- Do not send diskettes through the x-ray scanner, it can scramble the contents of diskettes.
- Do not walk through the "Bridge" metal detector with any magnetic media.

11) Question: Can I use my PowerBook Duo overseas?

Answer: Yes, PowerBook Duo power adapters are universal, which means it can sense that it is being used in an environment in which the voltage and frequency is different and switches itself over automatically. You may need a special plug or power cord so that the adapter plug can physically fit into the specific outlet.

12) Question: Can I upgrade my PowerBook Duo memory myself?

Answer: Yes, at your own risk, and as long as you are working in a static free environment, have removed all power sources (unplugged the machine and removed the battery), and have the correct tools. Damage caused during an upgrade

performed by non-trained personnel will not be covered by the Apple Limited Product Warranty however.

13) Question: Can I install a modem myself?

Answer: No, you will need to have an Apple authorized dealer install the modem.

14) Question: My PowerBook Duo will not startup. What can I do?

Answer:
a) Make sure the battery is seated properly. Refer to Apple FaxInfo article for instructions on how to reseat the battery.

b) Verify that you are using a known good battery

c) Verify that the AC adapter is a known good adapter and that it is plugged into a live outlet.

d) Verify that the display latch (where the display closes on the keyboard) is not stuck in the down position, thus making the machine think it should stay asleep.

e) Reset the power manager. The Power Manager is a switch on the logic board which controls battery recharging and sleep functions. To reset it:

Step 1

Unplug the computer from AC power and remove the battery.

Step 2

Hold down the power switch on the back (not the one on the keyboard) for 15 seconds.

Step 3

Let the PowerBook sit for one minute.

Step 4

Make sure the battery is seated properly.

Step 5

Remove the battery and try the computer when connected to AC power.

If the PowerBook Duo does not start up, try starting up with the PowerBook Duo AC Adapter plugged in. If the problem continues let the PowerBook recharge for about two hours and try starting up again.

15) Question: My PowerBook will not go into sleep mode on its own.

Answer: Make sure that AppleTalk is turned off in the Chooser. (If you have a FAX modem installed, verify that answer on ring is not selected.)

16) Question: After installing AppleTalk Remote Access, I get a message that AppleTalk Remote Access is not installed correctly.

Answer: Make sure that AppleTalk is turned on in the Chooser.

17) Question: When do I rebuild the desktop and how do I do it?

Answer: Rebuild the desktop when:
• Icons appear generic
• You cannot double click on a document and open it directly.
• The PowerBook does not mount a floppy disk on the desktop.
• The PowerBook does not remember its memory allocation for applications, set in the Get Info window in the Finder.

It makes sense to rebuild the desktop periodically, to clear redundant or irrelevant information from the directory file.

To rebuild the desktop:

Step 1

Restart the PowerBook and hold the Option and Command keys simultaneously immediately after you hear the start-up tone. Hold the keys down until the message "Are you sure you want to rebuild the desktop?" appears.

Step 2

Click the OK button and the desktop is rebuilt.

18) Question: Can I use the Duo in SCSI Disk Mode?

Answer: Yes, but you need a Duo MiniDock, an Apple HDI-30 SCSI Disk Adapter, model number M2539LL/A, a standard SCSI cable, part number M0206, and a SCSI terminator, part number M0209. You CANNOT use SCSI disk mode when using the Duo Dock, floppy drive adapter or PowerBook Duo alone.

19) Question: Which cable do I need if I want to hook up a SCSI device to my Duo?

Answer: If you are using a MiniDock or full dock use the HDI-30 System Cable (Long 18-inch light gray cable with 29 pins on the HDI-30 end) to connect a SCSI device.

20) Question: How do I zap the PRAM?

Answer: To clear the settings stored in the parameter RAM, in other words, to go back to factory default settings:

Step 1

Restart the PowerBook

Step 2

Immediately after the start-up tone, hold down the Command, Option, P, and R keys SIMULTANEOUSLY. Shortly, you hear a second start-up tone and see the machine going through the restart process again.

Step 3

After the second tone release the keys and the PowerBook starts up normally.

21) Question: The space bar does not register at times especially if I am typing very quickly.

Answer: Loosen the screw under the center of the keyboard 1/2 turn. Your service provider can also do this or you can call 1-800-SOS-APPL for technical support.

SECTION II: The Duo and the Duo Dock
==========

22) Question: My Duo does not dock with a floppy drive adapter or MiniDock.

Answer: Verify that the back panel door is open. Verify that the large connector looks clear. There are two small round holes and two small square holes that should be clear as well. Start to insert the dock, lining up the locating pins. Gently rock the dock and Duo until the two connect.

23) Question: My Duo does not undock from the floppy drive adapter or MiniDock.

Answer: Keeping gentle pressure on the release mechanism, gently rock the dock and Duo up and down, and from side to side. They should separate. It is normal for the mechanism to be a little tight when they are new. They loosen up and work in after time.

24) Question: My Duo will not dock in the Duo Dock.

Answer: Verify that the door on the back panel of the Duo is open and that the Dock is unlocked. Verify that AC power is being supplied to the Dock. If the

Duo will not be accepted into the Dock, it should be checked by a trained technician.

25) Question: My Duo does not startup in the Duo Dock.

Answer: Verify that the Duo Dock is plugged into a known good outlet by trying the monitor in to the same outlet. Try powering the dock on from the button in the back, the keyboard may be at fault. Try removing the battery in the PowerBook Duo. If it is low, it may not power up. If memory or a modem have been installed recently, verify that the keyboard does not look lifted on the right side. This may also cause the system not to restart.

26) Question: The Duo Dock display does not come on.

Answer: If the green power light is on, verify that the video cable is plugged in. If the light is not on, try plugging the display into a known good outlet.

27) Question: When using the Duo in the dock, the machine defaults to the top icon or item in any menu bar or window.

Answer: Does the machine have additional memory? If so check the keyboard, does the right side of the keyboard appear to be tilted up? If so the memory card is preventing the keyboard from sitting flush. When the Duo is closed it is putting pressure on the up arrow key.

28) Question: I cannot print.

Answer: Verify that the printer is plugged into the printer port and that the printer icon is selected (highlighted) in the Chooser.

29) Question: I cannot print to the serial printer from the modem port.

Answer: If the machine has an internal modem, be sure to change the setting to external modem in the PowerBook control panel.

30) Question: I can not print to my StyleWriter II printer.

Answer: Verify that the StyleWriter II icon is selected (highlighted) in the Chooser and not the StyleWriter icon. Verify that the StyleWriter II is connected to the printer port. You can also choose to plug the printer cable into the modem port, but make sure you selected the modem port in the Chooser as well. Finally, if you have an internal modem, select "external modem" in the PowerBook control panel. Should it remain non-functional, it is possible that the logic board in the Duo is damaged and needs service.

31) Question: Can the Duo be inserted into the Duo Dock while in sleep mode?

Answer: The Duo can be inserted into the Duo Dock while in sleep but the Duo will be ejected when the Duo Dock is powered on. When you bring the Duo out of sleep mode a dialogue box will appear informing you the Duo must be shut down, not in sleep mode, before it is inserted into the Duo Dock.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

QuickTime: How to Read Macintosh Movies on Windows PCs (3/97)

Revised: 3/11/97
Security: Everyone

QuickTime: How to Read Macintosh Movies on Windows PCs (3/97)

==========

Article Created: 14 December 1993
Article Reviewed/Updated: 11 March 1997

TOPIC ----------

How do I read QuickTime movies on a Windows-compatible PC which have been made on a Macintosh?

DISCUSSION ----------

When you created a QuickTime movie to be used on both Macintosh and Windows-compatible computers, there are two important things to remember:

First, the movie must be self-contained. That is, the movie must contain all of its video, sound, and all other data in the movie file.

Second, the movie must have a single fork (which is a data fork). This is because MS-DOS has no equivalent to the Macintosh Resource Manager or Alias Manager, which handles movies that reference other movie files. Self-contained, single fork movies can play on both Macs and Windows-compatible PCs with no performance penalties and no conversion required. Macintosh applications like DiVA VideoShop allow users to save movies with these attributes already set.

The Movie Converter utility for Macintosh is included on floppy disk #6 in the QuickTime for Windows Programmer's Guide kit. Use the Save As menu item in Movie Converter to create self-contained, multi-platform Movies.

You can also convert multimedia application data which has been created on a non-Macintosh platform to QuickTime movies playable on a Macintosh with the QuickTime Movie Exchange ToolKit. The ToolKit includes applications for DEC VAX, IBM RS6000, SGI, Sun-4, Cray YMP, and MS-DOS/Windows that let you easily create a QuickTime movie with both sound (8-bit) and images (8- and 24-bit). The APDA part number for this kit is R0190LL/A.

Another Way to Convert a QuickTime Movie

You can also follow these steps to make a movie playable on both Windows and the Mac OS platforms:

1) Open a movie file using Movie Player 2.0 or above on the Macintosh.
2) Choose Save As from the File menu.
3) In the dialog box that appears, click the radio button labeled "Make movie self-contained." This tells the utility to sever any links to other movies after incorporating the relevant video into this movie.
4) Select the checkbox labeled "Playable on non-Apple computers." This causes the movie to be saved as a single fork movie.
5) Rename the movie using PC naming conventions. The filename should be 8 characters in length for maximum portability. Use the extension ".mov." For example: MYMOVIE.MOV

The resulting file is a QuickTime cross-platform movie that can be played on either a Macintosh or any x86-based computer with Windows 3.x, Windows NT, and Windows 95.

Remember, when creating movies on the Macintosh that the following features are not yet available on Windows:

- -MACE, sprites, time code, and modifier tracks
- -Apple Component Video decompressor
- -Multiple video tracks
- -Display of non-burnt text tracks

Article Change History:
11 Mar 97 - Added additional way to convert movies.

System 7.1: Clean Installation for 660AV or 840AV (7/96)

Revised: 7/3/96
Security: Everyone

System 7.1: Clean Installation for 660AV or 840AV (7/96)

==========

Article Created: 9 December 1993
Article Reviewed/Updated: 02 July 1996

TOPIC

This article gives instructions for performing a clean installation on a Macintosh Centris 660AV, and Quadra 660AV or 840AV computers from the Install Me First CD.

DISCUSSION

Purpose of a Clean Installation

A normal installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It's also useful in troubleshooting.

FOLLOW THESE INSTRUCTIONS IN THE ORDER PRESENTED.

Restart with Install Me First CD

1) Shut down your Macintosh computer.

2) Be sure the Caps Lock key is up.

3) Restart the computer while holding down the Command-Option-Shift-Delete keys.

4) When you see the blinking question mark, continue holding down the four keys, and insert the CD into the drive.

The computer should start from the CD. At the desktop, the Install Me First CD should be in the upper-right corner of your screen with your hard disk below it. If the CD icon isn't above the hard drive icon, repeat these four steps.

Run Disk First Aid

Disk First Aid can detect and repair problems that a hard disk might have.

1) Double-click on Disk First Aid, and make sure the main hard drive is selected. If it isn't, click the Drive button to select the main hard drive.

2) Click on Open and then on Start. Disk First Aid will check your hard drive for any potential problems. If it finds problems, you should repair them.

3) Repeat this procedure for each hard drive attached to the system.

4) When you're finished verifying the hard drives, choose Quit from the File menu to return to the desktop.

If Disk First Aid can't repair a hard drive, you should back up the hard drive and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup.

Update Hard Disk Drivers

If you don't have an Apple hard drive or use third-party software to format your drive, don't use the Apple HD SC Setup Utility. However, you should contact your hard drive vendor to verify that your formatting software is compatible with SCSI Manager 4.3, preferably using an asynchronous SCSI driver.

If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that's on the Disk Tools disk, following these steps:

1) Open HD SC Setup.

2) Click on the Update button.

3) When you're finished, click Quit to return to the desktop.

Sometimes HD SC Setup can't update the hard disk driver (indicated by a "dimmed" Update button). If a third-party utility previously formatted the hard disk, you should obtain the latest version of the utility to update your hard drive.

Check Available Hard Drive Space

Be sure you have at least 11MB available on the drive where you plan to install the system software.

1) Choose Control Panels from the Apple menu.

2) Double-click the Views control panel to open it.

3) In the Views control panel, check "Show disk info in header".

4) Open your hard disk's window.

The amount of available space appears in the upper-right corner of any open window.

If there's less than 11MB available, you'll need to delete some unnecessary files by dragging them to the Trash. Empty the Trash from the Special menu and you'll have more disk space available.

Disable the System Folder

You disable the System Folder by moving the System and renaming the System Folder.

1) Open your hard disk's icon and locate the System Folder.

2) Open the System Folder and locate the System file.

3) Move the System file into the Preferences folder.

4) Close the System Folder's window and rename the System Folder "Storage."

5) Close all windows that are open on your desktop.

Install System 7.1

Install system software version 7.1 following these steps:

1) Double-click on the Install System Software icon located on the Install Me First CD.

2) When the "Welcome to the Apple Installer" message appears, click on OK and then on Install.

The Installer determines the required software and reads it from the CD.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding ANYTHING to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks aren't available, you may move the non-standard items from the Storage folder to the new System Folder. Be aware that reinstalling items from the old Storage folder into the new System Folder may reintroduce damaged or corrupt files. Be careful not to replace anything that's already in the new System Folder. Only move items that aren't already in the new System Folder.

1) Open each corresponding folder within the System Folder and the Storage folder and then compare the contents.

2) Move anything that isn't already in the new System Folder and its subfolders from the Storage folder and its subfolders.

3) Restart your Macintosh.

Troubleshooting Extension Conflicts

If you've installed any system extensions or control panels, you'll probably see their icons line up across the bottom of the screen when you restart. They load at startup time and modify the standard behavior of the operating system.

If the Macintosh fails to restart or behaves erratically, you probably have an incompatible, or conflicting INIT (also known as a system extension or control panel). To verify this problem, follow these steps:

1) Be sure the Caps Lock key is off.

2) Restart, and after you see the "Happy Mac" icon, hold down the Shift key.

3) Release the Shift key when the "Welcome to Macintosh, Extensions Off" message appears.

4) When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting extension or control panel. Continue with these steps:

1) Create a new folder on the desktop.

2) Move all items of Kind "system extension" or "control panel" from the System Folder, Extensions folder, and Control Panels folder to this new folder.

3) Close the System Folder, and restart the Macintosh.

4) Attempt to recreate the problem.

5) Move one item from the new folder on the desktop to the closed System Folder and restart the Macintosh.

6) Attempt to recreate the original problem.

Repeat steps 5 and 6 for each item in the new folder on the desktop until the

problem recurs. The last item returned to the System Folder is the cause of the problem.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

When the Macintosh behaves as expected, drag the Storage folder to the Trash.

Article Change History:
02 Jul 1994 - Removed Fax Information
01 Nov 1994 - Modified process for disabling old system folder.
29 Aug 1994 - Updated for FAX/TIL/QRG maintenance.

System 7.1: Clean Installation from Macintosh LC 520 CD (2/95)

Revised: 9/26/96
Security: Everyone

System 7.1: Clean Installation from Macintosh LC 520 CD (2/95)

==========

Article Created: 9 December 1993
Article Reviewed/Updated: 8 February 1995

TOPIC ----------

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It's also useful in troubleshooting.

DISCUSSION ----------

Follow these instructions in the order presented.

Restart with Install Me First CD
---

1) Shut down your Macintosh computer.

2) Restart the computer while holding down the
   Command-Option-Shift-Delete keys.

3) When you see the blinking question mark, continue holding down the
   four keys, and insert the CD into the drive.

The computer should start from the CD. Then you should see the At Ease menu. If you don't see this menu, repeat the preceding steps.

Run Disk First Aid

Disk First Aid software can detect and repair problems on a hard disk.

1) Click on the Disk First Aid button.

2) In the window that appears, be sure the startup hard drive is selected. If it isn't, click the Drive button to select the startup hard drive.

3) Click on Open and then on Start. Disk First Aid checks your hard disk for any potential problems. If it finds problems, you should let the software repair them.

4) Repeat this procedure for each hard disk attached to the system.

5) When you're finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid can't repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup.

Update Hard Disk Drivers

If you don't have an Apple hard drive or use third-party software to format your disk, don't use the Apple HD SC Setup utility. However, you should contact your hard drive vendor to verify that your formatting software is compatible with System 7.1.

If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that's on the Disk Tools disk, following these steps:

1) Double-click the HD SC Setup icon to launch it.

2) Click on the Update button.

3) When you're finished, click Quit to return to the desktop.

If HD SC Setup can't update the hard disk driver (indicated by a "dimmed" Update button), consider these possibilities:

- If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard disk.

- If a version of Apple HD SC Setup more recent than the version on the Disk Tools disk formatted your hard disk, don't update the hard disk drivers.

- If an earlier version of Apple HD SC Setup formatted the drive, it may not have left enough room for the updated driver. You don't have to update the hard disk drivers. However, if you intend to use file sharing or have a Macintosh that can use virtual memory, then you need to back up the disk and reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver is corrupt, the Macintosh doesn't recognize the disk (that is, the disk doesn't show on the desktop). You may wish to

reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver has been modified with compression or security software you will not be able to update the driver. Contact the vendor for additional help.

Check Available Hard Disk Space

Click on the Go To Finder button to exit At Ease. Be sure you have at least 5MB available on the disk where you plan to install the system software. To check hard disk space, follow these steps:

1) Choose Control Panels from the Apple menu.

2) Double-click the Views control panel to open it.

3) In the Views control panel, check "Show disk info in header."

4) Open your hard disk's window.

The amount of available disk space appears in the upper-right corner of any open window.

If there's less than 5MB available, you'll need to delete some unnecessary files by moving them to the Trash. Choose Empty Trash from the Special menu, and you'll have more disk space available. Or you can copy files onto floppy disks or other media before moving them to the Trash.

Disable the System Folder

You disable the System Folder by moving the System and renaming the System Folder.

1) Open your hard disk's icon and locate the System Folder.

2) Open the System Folder and locate the System file.

3) Move the System file into the Preferences folder.

4) Close the System Folder's window and rename the System Folder "Storage."

5) Close all windows that are open on your desktop.

Restart Your Computer

Choose Restart from the Special menu. The system automatically ejects the CD, and after a few seconds you should see a picture of a disk with a flashing question mark.

If your Macintosh starts up from the hard drive, you have an extra System Folder on the hard disk. You need to delete it (or disable it as described in the

previous section), then restart.

When you get the disk with the flashing question mark on your screen, you can continue. If you still don't see this on your screen, turn off your Macintosh and all attached peripherals and disconnect the SCSI cable from the back of the Macintosh. Start your Macintosh again.

Install System 7.1

Install system software version 7.1, following these steps:

1) When you see the flashing question mark, insert the Install Me First CD.

2) When the At Ease menu appears, click on the button labeled Install System.

3) When the "Welcome to the Apple Installer" message appears, click on OK.

4) When another screen appears, click on Install.

The Installer determines the required software and reads it from the CD.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks aren't available, you may move the non-standard items from the Storage folder to the new System Folder. Be aware that reinstalling items from the old Storage folder into the new System Folder may reintroduce damaged or corrupted files. Be careful not to replace anything that's already in the new System Folder. Only move items that aren't already in the new System Folder.

1) Open each corresponding folder within the System Folder and the Storage folder and then compare the contents.

2) Move anything that isn't already in the new System Folder and its subfolders from the Storage folder and its subfolders to the new System Folder.

3) Restart your Macintosh.

Troubleshooting Extension Conflicts

If you've installed any system extensions or control panels, you'll probably see their icons line up across the bottom of the screen when you restart. They load into memory at startup time and modify the standard behavior of the operating system.

Verify INIT Conflict

If the Macintosh fails to restart or behaves erratically, you probably have an incompatible or conflicting INIT (also known as a system extension or control panel). To verify this problem, follow these steps:

1) Be sure the Caps Lock key is off.

2) Restart, and after you see the picture of a smiling Macintosh, hold down the Shift key.

3) Release the Shift key when the "Welcome to Macintosh, Extensions Off" message appears.

4) When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting extension or control panel. Continue with the next section.

Remove and Replace INITs in System Folder

1) Create a new folder on the desktop and name it "INITs."

2) Open the System Folder, Extensions folder, and Control Panels folder, and choose by Kind from the View menu. Find all items of Kind "system extension" or "control panel" under the Kind heading in the windows of the open folders, and move them to the INITs folder.

3) Close the System Folder, and restart the Macintosh.

4) Attempt to recreate the problem.

5) Move one item from the INITs folder to the closed System Folder and restart the Macintosh.

6) Attempt to recreate the original problem.

Repeat steps 5 and 6 for each item in the INITs folder on the desktop until the problem recurs. The last item returned to the System Folder is probably the cause of the problem. Remove it from the System Folder (restart, holding down the Shift key again, if necessary), and contact the developer of the INIT for more information.

Final Steps

Verify that your applications are performing normally. If not, refer to the

application manual or contact the vendor.

When the Macintosh behaves as expected, drag the Storage folder to the Trash, and choose Empty Trash from the Special menu.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
08 Feb 1995 - Added information on compressed drivers.
01 Nov 1994 - Modified process for disabling old system folder.
29 Aug 1994 - Updated for FAX/TIL/QRG maintenance.

HyperCard 2.2 New Feature: AppleScript Support (12/93)

Revised: 12/24/93
Security: Everyone

HyperCard 2.2 New Feature: AppleScript Support (12/93)

==========

Article Created: 13 December 1993

TOPIC ----------

HyperCard 2.2 supports Open Scripting Architecture (OSA). This means you can write HyperCard scripts either in HyperTalk, or in any language defined by an external scripting system: AppleScript, for example.

DISCUSSION ----------

If you write in AppleScript, you can have your stacks or standalone applications communicate with other scriptable applications such as FileMaker Pro 2.0 and Microsoft Excel 4.0.

Scripts can receive messages as well as send or pass messages to other scripts, regardless of the script's language. So a button script written in HyperTalk can send a message to a card script written in AppleScript, which can, in turn, pass the message to a background script written in UserTalk.

HyperCard 2.2 accommodates scripting components that don't support the optional OSA event handling interface. You can invoke scripts that belong to such components by sending them a run message:

```
send "run" to button 1 -- run an attached QuicKeys script
```

For AppleScript details, see the HyperCard AppleScript Reference stack.

Note: To take advantage of AppleScript code in your stack, the user must be running System 7.0 (or later) and have AppleScript 1.1 installed.

This article was adapted from the HyperCard 2.2 New Features stack.

HyperCard 2.2 New Feature: Three New Button Styles (12/93)

Revised: 12/10/93
Security: Everyone

HyperCard 2.2 New Feature: Three New Button Styles (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

HyperCard 2.2 offers three new button styles: Default, Oval, and Standard.

DISCUSSION --------------------

- The Default button style is the same type you see for the OK button in most dialog boxes: it's outlined with both a thin (one-pixel) line, and with a thicker line (three pixels thick).

- The Standard style is a rounded rectangle without a shadow. It looks like a Cancel button: its outline is a single one-pixel line.

- The Oval button style is transparent. Use it to overlay circular or oval shapes. Although the boundary of an oval button is rectangular, HyperCard respects its oval shape when tracking the mouse for highlighting and for messages (mouseEnter, mouseWithin, mouseLeave) and mouse clicks.

A separate article describes another new button style: pop-up button.

This article was adapted from the HyperCard 2.2 New Features stack.

HyperCard 2.2 New Feature: Buttons as Containers (12/93)

Revised: 12/10/93
Security: Everyone

HyperCard 2.2 New Feature: Buttons as Containers (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

Starting with HyperCard 2.2, buttons can contain up to 30,000 text characters.

DISCUSSION --------------------

Editing Button Contents

Except for a pop-up button, where each line of a button's contents is an item in the button's pop-up menu, the contents of a button don't show. But you can edit the contents either through scripts (using the put command), or through the Button Contents editor, accessible in the button's Info dialog box. The contents of a button is always stored unformatted.

Pasting With Data

To paste a Clipboard-resident button with its data intact, hold down the Shift key as you paste (or press command-shift-V), just as you would paste a field with its text intact.

Button Expressions

Button expressions evaluate to the button's contents, just as field expressions evaluate to the contents of the specified field.

HyperCard 2.2 New Feature: Button Families (12/93)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2 New Feature: Button Families (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

A button family is a group of two or more buttons, only one of which can be highlighted at a time. When one button in a family is highlighted, all the other buttons in that family are automatically unhighlighted.

DISCUSSION --------------------

You assign a button to a family by giving it the same family number as other members of that family. To assign a family number to a button, use the Family pop-up menu in the Button Info dialog box. You can also assign a button to a family in a script using the family property.

You can create up to 15 families on each card and up to 15 families on each background.

When you add a button to a family (that is, give it a family setting of anything except "none"), its Auto Hilite option is automatically turned on.

HyperCard 2.2: Requirements & Compatibility (12/93)

Revised: 12/24/93
Security: Everyone

HyperCard 2.2: Requirements & Compatibility (12/93)

==========

Article Created: 13 December 1993
Article Reviewed/Updated: 24 December 1993

TOPIC ----------

HyperCard 2.2 is the third update to HyperCard version 2.0; it supersedes versions 2.0, 2.0v2, and 2.1.

This article, adapted from the HyperCard 2.2 "New Features" stack, lists basic HyperCard 2.2 information.

DISCUSSION ----------

System Software Requirements

HyperCard 2.2 requires Macintosh System Software version 6.0.5 or later, or A/UX version 2.0 or later.

Using HyperCard 2.2 Stacks With Earlier HyperCard Versions

None of the new features of HyperCard 2.2 can work under earlier versions of HyperCard.

WARNING: If under versions of HyperCard earlier than 2.2 you compact a 2.2 stack that contains non-HyperTalk scripts, the non-HyperTalk scripts are likely to be deleted, causing the stacks to behave in unexpected ways.

OSA Compatibility

For features related to Apple Open Scripting Architecture (OSA), you'll need Macintosh System Software version 7.0 or later -- and the AppleScript extension.

AppleScript Requirements

For AppleScript-related functionality, you'll need:

- System Software 7.0 or later
- AppleScript 1.1

For component-related functionality, you'll need:
- QuickTime 1.6 or System Software 7.1

Security: Everyone

HyperCard 2.2: General Description (9/94)

==========

Article Created: 13 December 1993
Article Reviewed/Updated: 28 September 1994

TOPIC ----------

This article provides an overview of Apple's HyperCard 2.2 software.

A separate Tech Info Library article provides the technical specifications for HyperCard 2.2; and several other articles describe, in detail, features that are new or enhanced in version 2.2 of HyperCard.

DISCUSSION ----------

Overview

HyperCard is a tool for creating custom software solutions for business, education, and media integration. Commercial developers, consultants, in-house programmers, and end-users can use it to acquire, manage, and display information just the way they need to.

HyperCard organizes information in easy-to-use "stacks" of "cards" through which uses can navigate and search for the information they need. Simply by clicking a button, they can view related text, see a graphic, hear a sound, or watch a QuickTime movie.

Easy to Learn

Familiar Macintosh interface elements make HyperCard so easy to learn that beginners can start creating stacks right away. HyperCard also offers extensive online help, as well as ready-to-use stacks, templates, and software objects (buttons, etc.).

Development Environment

HyperCard is an ideal development tool for a wide range of applications, including multimedia presentations, front-ends to data on host computers,

courseware, and computer-based training materials. And its compatibility with Apple's WorldScript system extension helps you easily create multilingual solutions.

Using HyperTalk (HyperCard's built-in scripting language), AppleScript, or any other scripting language that's compatible with Apple's OSA (Open Scripting Architecture), you can write scripts and attach them to HyperCard buttons that launch, control, and exchange data with other off-the-shelf applications, either locally or over a network. This lets you create HyperCard applications that automate repetitive tasks, such as collecting data from multiple sources and generating reports from it.

HyperCard provides a robust prototyping and development environment for professional developers. It comes with powerful scripting tools, a modeless script editor, hypertext support, debugging tools, external commands, and many other features to help you create powerful custom software.

A new option in HyperCard version 2.2 lets you save any stack as a standalone double-clickable Macintosh application that can be distributed without royalty fees.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

HyperCard 2.2 New Field Style: List Field (12/93)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2 New Field Style: List Field (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

A list field is a field from which a user can make choices. This kind of field is new in HyperCard 2.2.

DISCUSSION --------------------

When a user clicks a line or drags through a series of lines in a list field, the lines are highlighted. A script can detect the highlighted lines and take appropriate action.

The Field Info dialog box has two new options to make list fields possible:
• Auto Select
• Multiple Lines.

To create a list field, select the Auto Select, Don't Wrap, and Lock Text options in the Field Info dialog box. To allow the user to highlight more than one line at a time, you also select the Multiple Lines options.

(The user highlights more than one line either by dragging through several lines or by highlighting one or more lines and then shift-clicking elsewhere in the field.)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2: Message Box Enhancements (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

In HyperCard 2.2, the message box has two new features.

DISCUSSION --------------------

- Command-Shift-A selects all text in the Message box when it's open for editing.

- You can control the font, style, and size of text in the Message box by setting its textFont, textSize, and textStyle properties (but you don't have access to the Text Style dialog box). For example, to make the type in the message box larger, type:

```
set the textSize of the message to 14
```

Revised: 12/9/93
Security: Everyone

HyperCard 2.2: Miscellaneous Enhancements (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

This article describes a number of new enhancements in HyperCard 2.2 that aren't described in articles of their own.

DISCUSSION --------------------

- You can now undo the deletion of a button or field.
- The maximum number of stacks in use, formerly 10, is now 16.
- The New Stack and Resize Card popup menus now have a PowerBook (640x400) setting.
- The maximum number of open windows is limited only by memory.
- There is now balloon help for all built-in menus, windows, and many dialog boxes.
- You can drag many modal dialog boxes (including the object Info dialog boxes) to where you want them on the screen. If you're running System 7, you now have access to the Edit menu while a modal dialog box is on the screen.
- Four new visual effects are now available: push left, push right, push up, and push down. These visuals are like the wipe set of effects, except that the push effects appear to push the current card off the screen.

HyperCard 2.2: Miscellaneous HyperTalk Enhancements (12/93)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2: Miscellaneous HyperTalk Enhancements (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

This article describes several HyperTalk enhancements that appear with HyperCard 2.2. For more detail, see the new HyperTalk Reference stack. See also the Tech Info Library article on HyperCard 2.2's enhanced HyperTalk commands.

DISCUSSION --------------------

hilite: If a button belongs to a family and its hilite property is set to true from a script, the hilite property of each of the other buttons in the family is set to false.

menu: You can specify a menu by its ID number. You can specify the System 7.x keyboards menu by its name.

menuItem: You can use the adjective "English" to determine the names of menus and menu items in English:

```
if the English name of menuItem 5 of menu "Edit" is "Paste"...
```

play: If a sound fails to play, HyperCard sets the result to "Couldn't load sound". The result gets "Sound is off" if the volume is 0, if HyperCard is running in the background, or if an XCMD is using the sound channel. A note string can now contain as many characters as you want.

program: You can specify a program by its ID, which is its application signature:

```
put the ID of HyperCard -- -> WILD
get there is a program ID "MACS" -- is the Finder running?
```

You can say "this program" when you refer to the current process.

programs: You can get a list of Apple event-aware programs running on remote machines by using the form

```
get the programs of machine zone:Mac
```

rect: You can retrieve (but not set) the complete complement of rect properties of the menu bar: rect, width, height, top, and so on.

value: There is no limit to the character count for value's argument. When the argument of value is a multi-token literal expression, the expression evaluates to itself:

```
put value("HyperCard 2.2") -- -> HyperCard 2.2
```

HyperCard 2.2 New Feature: Part Numbers (12/93)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2 New Feature: Part Numbers (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

The "part number" -- new in HyperCard 2.2 -- is a button or field's ordinal position among all the buttons and fields that share a domain (a card or a background).

For example, if the ordering of parts on a card is card button 1, card button 2, card field 1, card field 2, and card button 3, the part number of card field 1 is 3. (Its layered position is third in a set of five.)

DISCUSSION --------------------

The part number is available in the object's Info dialog box; in a script, it's available in the object's partNumber property.

Changing Part Numbers

When an object's position relative to other objects within a domain changes, its part number changes -- as when it moves closer to, or farther away from, the front.

Lowest and Highest Part Number in a Domain

The object farthest away from the front within its domain has a part number of 1; the object closest to the front in its domain has a part number equal to the total number of objects in that domain.

HyperCard 2.2 New Feature: Pop-up Buttons (12/93)

Revised: 12/10/93
Security: Everyone

HyperCard 2.2 New Feature: Pop-up Buttons (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

In HyperCard 2.2, the Pop-up button style lets you create buttons that become pop-up menus. Each line within the button's contents is an item in the pop-up menu.

DISCUSSION --------------------

How a Button Appears

The Pop-up button's name appears as the menu title to the left of the collapsed button; the collapsed button's window shows the current selection. To change the space allocated to the title, either drag the left side of the button's content area with the Button tool or change the Title Width setting in the Button Info dialog box.

Editing Button Contents

You enter and edit the items of a button's pop-up menu through the Button Contents editor, accessible in the button's Info dialog box -- or through scripts using the put command. The menu items appear in the same font as the title of the button.

Determining the Selected Menu Item

The description of the currently selected item in the menu is the button's selectedLine and its text is the selectedText. To set a selection, use select line n of button.

This article was adapted from the HyperCard 2.2 New Features stack.

Although Apple's official spelling for the adjective is "pop-up", HyperCard itself spells it "popup".

HyperCard 2.2 New Report Printing Features (12/93)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2 New Report Printing Features (12/93)

==========

Article Created: 13 December 1993

TOPIC ----------

This article describes new report-printing features in HyperCard 2.2.

DISCUSSION ----------

Precision Adjustments for Report Layouts

In previous versions of HyperCard, you could hold down the Command key as you dragged to gain finer control over margins, cell spacing, and cell size. Now you check the newly added Precision Adjustments box, and save wear and tear on your Command-key finger.

Save Button

The Print Report dialog box now has a Save button so that you can immediately save changes you've made to the template.

Report Item Invert Option

The Report Item Info dialog box now has an Invert option. Checking its box inverts the item so that it prints as white text on a black field.

Report Item Framing Option

By checking from one to four boxes of the new Frame option, you can set off an item by drawing a line along any of its left, right, top, and bottom sides.

HyperCard 2.2: Specifications (7/96)

Revised: 7/8/96
Security: Everyone

HyperCard 2.2: Specifications (7/96)

==========

Article Created: 13 December 1993
Article Reviewed/Updated: 02 July 1996

TOPIC --

This article contains technical specifications for HyperCard 2.2 software.

A separate Tech Info Library article provides a general description of HyperCard 2.2, and several separate articles describe, in detail, features that are new in version 2.2 of HyperCard.

DISCUSSION --

System Requirements

- An Apple Macintosh computer: Macintosh Plus or later with at least 2MB RAM (4MB required with System 7)
- Macintosh System software version 6.0.5 or later (AppleScript requires System 7), or A/UX version 2.0 or later
- Hard disk drive
- QuickTime Tools requires System 6.0.7 or later, the QuickTime extension, 4MB RAM, and a 68020 (or later) processor.
- With System 6, Color Tools requires 32-bit QuickDraw extension.

OSA Support

Apple's Open Scripting Architecture (OSA) lets you:

- Use any OSA-compatible scripting language, including HyperTalk, AppleScript, UserTalk (from UserLand), and CEScript (from CE Software).
- Use localized versions of AppleScript system extensions to script in French, Japanese, or other languages (requires additional software)
- Link HyperCard stacks with any of more than 75 OSA-compatible applications, such as Claris FileMaker Pro 2.0 and Microsoft Excel 4.0 (applications must be running under System 7).
- Attach AppleScript scripts to HyperCard objects, such as buttons, to launch and control other applications, exchange data with them, and so on

-- even over a network.
• Take advantage of support for the Required, Core, and HyperCard suites of Apple events to launch and control HyperCard from other applications, as well as exchange data between them.

Multimedia Features

With HyperCard 2.2, you can:
• Add sound, animation, and graphics to stacks.
• Use the QuickTime Tools stack to add QuickTime movies to stacks.

Color Support

With the included Color Tools stack, you can:
• Assign colors to buttons, fields, backgrounds, and cards.
• Select from a palette of 256 colors.
• Import color or grayscale PICT graphics.
• Resize and reposition graphics on the card.
• Apply color transitions between cards and between stacks.
• Layer graphics under or over buttons and fields.

Development Features

The HyperCard development environment lets you:
• Use XCMDs (external commands) to control various systems and equipment, including mainframe computers, networks, videodisc players, and CD-ROM drives.
• Add features and commands to HyperCard applications by using XCMDs to call routines from languages such as C or Pascal.
• Implement hypertext applications through links from a word or group of words.
• Use shared code libraries to quickly add commonly-used sounds, external commands, pictures, and other elements to different stacks and to save disk space.

Scripting and Debugging Tools

HyperCard 2.2 provides several powerful tools:
• The modeless script editor lets you view several scripts and stacks at once and quickly copy and paste HyperTalk or AppleScript code between them.
• The debugging menu lets you set checkpoints in, and step and trace through, a script while it's running -- for fast and easy troubleshooting.
• Background processing lets you continue working in other applications while complex scripts are running or while you compact or sort a stack.
• Variable Watcher shows how variables are used and changed, and lets you edit variables while debugging your scripts.
• Message Watcher lets you view HyperTalk messages as they're sent, so you can see how your program's logic really works.

Flexible Formatting and Reporting

HyperCard 2.2 lets you:
• Design multiple report layouts for each stack -- and copy and paste

report formats between stacks.
- Control the content, appearance (including font, size, and style), and placement of text elements in report formats.
- Define the optimum appearance, order, and functions of menus and menu items for each application.
- Create card sizes ranging from one inch square to 18 inches square.
- Print individual fields, selected parts of a card, a single card, selected cards (those containing a certain word, button, or background), or an entire stack.

HyperCard 2.2 New Feature: Standalone Applications (12/93)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2 New Feature: Standalone Applications (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

If you're using HyperCard 2.2 and Macintosh System 7, you can create a standalone application from any HyperCard stack. Standalone applications work on their own: others can use your stacks even if they don't own HyperCard.

DISCUSSION --------------------

Creating a Standalone Application
---

1) Choose Save A Copy... from the File menu.

2) Choose Application from the "File type" popup menu at the bottom of the Save A Copy dialog box.

3) A dialog box appears into which you can type information for the Finder's Get Info window. You can use this information to keep track of versions of the application as you develop it. You can summon an additional dialog box, of use mainly to advanced developers, into which you can type more detailed version information.

   WARNING: Once a standalone application is created, it cannot become a stack again -- and, from a development point of view, is frozen in its new form.

Script Security

Because standalone applications have no script editor, the user has no access to your scripts.

Custom File Type

HyperCard provides the file type code STAK to standalone applications. You

can provide your own file type code by choosing Custom file type from the "File type" popup menu. Again, this feature is intended for advanced developers.

WARNING: Creating a standalone application with anything other than the default application signature can have unexpected results. For information about avoiding such surprises, see "Create a Standalone Application" in the HyperCard Help stack.

HyperCard 2.2 New Feature: WorldScript Compatibility (12/93)

Revised: 12/9/93
Security: Everyone

HyperCard 2.2 New Feature: WorldScript Compatibility (12/93)

==========

Article Created: 13 December 1993

TOPIC --------------------

HyperCard 2.2 conforms to WorldScript compatibility requirements.

DISCUSSION --------------------

Sensitive to the current key script or font script (as appropriate), HyperCard invokes special-case code for handling non-Roman text characteristics as necessary.

Additionally, HyperCard 2.2 properly displays fields that contain double-byte characters, bidirectional text, or contextual ligatures, as long as the relevant script is installed on the computer. (The script no longer needs to be the system script.)

This means that HyperCard can now show languages such as Japanese, Arabic, Korean, and Traditional Chinese without the problems of previous versions.

This article was adapted from the HyperCard 2.2 New Features stack.

LaserWriter Pro 810: Fuser Temperature

Revised: 12/10/93
Security: Everyone

LaserWriter Pro 810: Fuser Temperature

==========

Article Created:10 December 1993

TOPIC ----------

What is the fuser temperature for the LaserWriter Pro 810?

DISCUSSION ----------

The fuser temperature in the standby mode is 392 degrees fahrenheit (200 degrees Celsius). During printing the temperature rises to 410 degrees fahrenheit (210 degrees Celsius). Paper moving through the printer must be able to withstand the printing temperature for 0.1 seconds without discoloring or melting any of the dyes or coatings that may have been used for printing the a letterhead.

Macintosh LC 520: Button Disabler Software (12/93)

Revised: 12/13/93
Security: Everyone

Macintosh LC 520: Button Disabler Software (12/93)

==========

Article Created: 13 December 1993

TOPIC ----------

A flier named "Update to Getting Started With Your Macintosh LC 520" describes a control panel called Button Disabler. It disables the buttons on the front of the Macintosh LC 520, so that students can't adjust the volume or brightness.

The flier also states that the control panel is already installed with the system software, but I don't find this control panel.

DISCUSSION ----------

System Enabler 403 version 1.0 didn't include modifications required for a Button Disabler control panel. Engineering then received feedback from customers requesting a way to disable the front buttons. In order to implement the Button Disabler, they also needed to revise the System Enabler for the Macintosh LC 520. Version 1.0.1 was released, which included three new disks -- the Install Me First disk, the Disk Tools disk, and the Extras disk. If you have System Enabler 403 version 1.0.1, you'll have the Button Disabler.

The documentation for the Macintosh LC 520 couldn't be revised, so a flier describing the Button Disabler was included instead. This flier ships with the Macintosh LC 520 computers that have the Button Disabler software already installed on the computer. A customer shouldn't have one of these fliers unless they have the Button Disabler and System Enabler 403 version 1.0.1.

Apple Basic Color Monitor: Medical Specifications (12/93)

Revised: 12/14/93
Security: Everyone

Apple Basic Color Monitor: Medical Specifications (12/93)

==========

Article Created: 14 December 1993

TOPIC ----------

What is the implosion or protection rating on the Apple Basic Color Monitor in regards to complying with the UL 544 (Underwriters Laboratory Specifications)? This knowledge is for the use of the monitor in a medical environment.

DISCUSSION ----------

The UL 544 specification is designed specifically for medical equipment that is directly interfaced to a patient (heart monitor, and so on). The Apple Basic Color display does not fall into this category. However, it does meet or exceed the UL478 and UL1950 standards.

HyperCard 2.1: Power Tools Problems (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard 2.1: Power Tools Problems (7/92)

==========

Article Created: 12 August 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --

This article describes some problems in the HyperCard 2.1 Power Tools stack.

DISCUSSION --

- In the stack script's powerMenuItems function, the line just before "end powerMenuItems" should start with a quote.

- In the stack script's doInUseMenu handler, the line

  {put "goStack" && it & "," after theMsgs}

  should be

  {put "goStack" && quote & it & quote & "," after theMsgs

- When the Power Tools stack is in use, the Undo command will not work in other stacks, although It will continue to work in the Power Tools stack. Power Tools needs to be in use, not just open, to reproduce this problem.

HyperCard: Accidental Creation of New Background (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Accidental Creation of New Background (7/92)

==========

Article Created: 16 December 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

If you copy a card to the clipboard, make changes to the background with which that card was associated, then paste the card back into the stack, HyperCard will create a new background for the card.

It will of course look almost identical to the cards of its original background, but it will lack any objects or art created while it was residing in the clipboard, and it will have a new background ID.

DISCUSSION ----------

To test this:

1) Open a test stack.

2) Go to "Bkgnd Info..." under the objects menu and note the background ID, click OK.

3) Choose "Copy Card" from the Edit menu.

4) Choose "Paste card" from the Edit menu, and check "Bkgnd Info..." to see that the background ID number matches the first background ID.

5) Choose "Background" from the Edit menu.

6) Choose the pencil tool, then click anywhere to change just one pixel in the background.

7) Choose "Paste Card" from the Edit menu, and check "Bkgnd Info..." again. You will see that the background ID has changed.

HyperCard: Answer Command Quirks (8/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Answer Command Quirks (8/92)

==========

Article Created: 2 June 1992
Article Reviewed/Updated: 26 August 1992

TOPIC --------------------

The following anomalous result occurs with the use of specific strings in the answer command:

```
answer "4^2 ="  &&  4^2
```

results in 4 = 16

DISCUSSION --------------------

It turns out that the answer command ignores the substrings "^0","^1","^2", "^3", whenever any of these appear in the text prompt of the answer command (probably for all variations and probably also in the "ask" command.)

This is a feature of the Dialog Manager, which treats these strings as placeholders.

For more technical detail, see the ParamText procedure in Inside Mac Volume I.

HyperCard: Calculating Age (7/92)

==========

Article Created: 14 May 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Here's a HyperCard handler that accurately calculates a person's age.

DISCUSSION --------------------

```
on calcAge

  put the date into curDate
  convert curDate to seconds
  put curDate + 86400 into curDate
  convert curDate to dateItems
  put item 1 of curDate into curYear

  put background field "BDay" into Birth
  convert Birth to seconds
  put Birth + 86400 into Birth
  convert Birth to dateItems
  put item 1 of Birth into BYear

  put curYear - BYear into tempAge

  Put 1900 into item 1 of curDate
  convert curDate to seconds

  put 1900 into item 1 of birth
  convert birth to seconds

  if curDate < birth then
    put tempAge - 1 into tempAge
  end if

  put tempAge into background field "Age"
```

```
end calcAge
```

Where BDay is a background field containing a birthdate and Age is a background field into which the calculated age will be placed.

HyperCard 2.0: Color Pictures in HyperCard (6/93)

Revised: 12/20/93
Security: Everyone

HyperCard 2.0: Color Pictures in HyperCard (6/93)

==========

Article Created: 15 May 1991
Article Reviewed/Updated: 11 June 1993

TOPIC ----------

HyperCard 2.0 supports color pictures using the picture command.

DISCUSSION ----------

The syntax is as follows:

```
on mouseUp -- or on cardOpen or stackOpen, etc.
  picture [fileName, fileType, windowStyle, visible, depth]
end mouseUp
```

FileName is the name of a file or resource. These must be either PICT files or PNTG files. To make these files a resource and a permanent part of the stack, the stack must be modified with ResEdit.

FileType is the kind of file the picture is. It can be a resource file, as mentioned above or it can be a separate file on the Macintosh. The file can also be on the clipboard.

WindowStyle is the style of window in which the picture is displayed. You can use any of the types of windows in the Macintosh toolbox: plain, rect, zoom, roundRect, dialog, document, shadow, and windoid. The default type is zoom, which is the kind of window a document is normally shown in with most applications.

Visible is a Boolean value, meaning it can be true or false; true for visible, false for invisible.

Depth is the bit depth of the off-screen buffer that's created by the picture command. See "Picture Command" in the HyperCard Script Language Guide for an explanation of how this works.

```
Example:
    on mouseUp
      picture, "Lake", resource, plain, true, 0
  end mouseUp
```

This would display a picture titled "Lake", which had been made a part of the stack with ResEdit. The picture would be visible and would be painted on the screen with bit depth buffer of zero.

To dismiss a picture created with the picture command, you can either close it using its close box (if there is one in its window) or you can script it. You'd use the following syntax:

```
    on mouseUp
      close window "Lake"
    end mouseUp
```

Note that you must say close window, not close picture.

HyperCard: Corrupted Stack (HyperCard Stack Won't Open) (11/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Corrupted Stack (HyperCard Stack Won't Open) (11/92)

==========

Article Created: 19 June 1991
Article Reviewed/Updated: 30 November 1992

TOPIC ----------

When trying to open a HyperCard stack that has been corrupted, one of three things may happen:

- HyperCard opens the Home stack instead of the stack desired, and doesn't let the user open the desired stack at all.

- HyperCard seems to open and load, but instantly quits to the Finder without showing any card windows.

- HyperCard reports an error has occurred with an error number, and exit either to the Home stack or to the Finder.

DISCUSSION ----------

Here are the solutions:

- A utility named CanOpener available from Abbot Systems, Inc., will extract all text, PICT, icon and sound resources from most stacks that have been corrupted. All of the stack scripts, including the scripts of buttons, fields, cards, etc., will be recovered as a text resource.

- If all else fails, restore the most recent back-up of the stack.

And some tips for prevention:

- If possible, avoid creating and modifying stacks on a floppy disk.

- Compact your stack often.

- When developing a stack, work on a copy -- and ALWAYS make back-ups.

HyperTalk: Deleting Groups of Objects (7/92)

Revised: 12/21/93
Security: Everyone

HyperTalk: Deleting Groups of Objects (7/92)

==========

Article Created: 30 March 1992
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

I'd like to delete a series of objects when a particular button gets deleted (selecting the button tool, clicking on the button and then pressing the delete key). To accomplish this, I tried using the following handler:

```
on deleteButton
  select cd btn "anotherButton"
  doMenu "Clear Button"
end deleteButton
```

Although the other object[s] get deleted, the original button that has the script in it does not get deleted.

DISCUSSION --------------------

The following handler will do what you expect.

```
on deleteButton
  select cd btn "anotherButton"
  doMenu "Clear Button"
  select me
  pass deleteButton
end deleteButton
```

As you might guess, having a script delete other objects after receiving a deleteButton message can create some problems and bring up some tricky issues. The main point here is that when HyperCard sends certain messages like deleteButton and deleteField, the object has not yet been deleted. Therefore, HyperCard currently deletes the selected/current object after this message is sent (this may change so do not rely on it). So, when you have a script that does something on a delete message, just make sure that the object selection does not change after this message is sent. Example,

if you have

```
on deleteButton
  select cd fld 1
end deleteButton
```

the first field will be deleted. Also, no "deleteField" message will be sent because you tricked HyperCard into deleting a field when it thought it was going to delete a button.

A final note: Watch out for unexpected recursion. The example script you included can easily become recursive by putting this anywhere but in a button or a field script.

HyperCard: Cause of Disappearing Heap Space (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Cause of Disappearing Heap Space (7/92)

==========

Article Created: 17 January 1992
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

If two HyperCard stacks are open simultaneously, and one of them has a resource fork, is locked and in use -- switching back and forth between the stacks (even just clicking on their windows alternately in the Finder) will gradually diminish HyperCard Heap Space.

DISCUSSION ----------

The stack in use has to be locked and have a resource fork (new stacks that have not been created with a copied background have no resource fork). It does NOT have to contain resources. (It can get into this state by opening it in ResEdit or by adding and deleting a resource.)

The other stack does not have to be locked.

The Cause

HyperCard is opening a new access path to the stack in use every time you switch stacks.

To the Macintosh operating system, every time you switch stacks it looks like you are opening another file. In System 6.0.7, there is a limit of 40 open files (actually, it's 40 open forks), so HyperCard will eventually refuse to switch stacks. In System 7.0 and later, there is no limit, so heap space will simply continue to drop until HyperCard runs out of memory.

This behavior is confirmed in HyperCard 2.1 and we know of no workaround.

HyperCard: Finding Text in Scripts (7/92)

==========

Article Created: 15 May 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

This article describes how find a string of text in a script.

DISCUSSION --------------------

To find a string of text in a script (no matter where it's located), type the following into the message box:

```
ss "search string "
```

For example, in order to find a handler called MoveItAround, type

```
ss "MoveItAround"
```

into the message box. HyperCard will search all scripts in the open stack. When it finds the script containing the string, it will stop and open the script up. To find exactly where the string is within the script, choose "Find" under the "Go" menu or type command-F. HyperCard will have automatically copied and pasted the string into the Find window. At this point, hitting the Enter key will find it and show you exactly where it is in the script.

This article describes two small anomalies involving HyperCard and After Dark.

DISCUSSION ----------

The screen saver After Dark v. 2.0, runs silently if HyperCard is the application that's open when After Dark kicks in. This is because HyperCard takes control over sound while it is running.

After Dark, v.2.0u (for System 7) may also cause the cursor to change to After Dark's "never sleep" icon. This has been reported to Berkeley Systems.

additional search term: AfterDark

HyperCard and QuickTime (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard and QuickTime (7/92)

==========

Article Created: 23 January 1992
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

What is QuickTime, and how does it relate to HyperCard?

DISCUSSION ----------

QuickTime is Apple's technology for storing and displaying digital "movies" on the Macintosh screen. Movies can be compressed still images, animations, or captured video. QuickTime provides Macintosh developers and customers with a software-only solution for integrating motion video into Macintosh applications.

What Do I Need to Run HyperCard with QuickTime?

• A Macintosh computer with a 68020 processor or better.

• The QuickTime stack is a high-level authoring tool for users to integrate movies into their HyperCard applications. You must have Apple QuickTime software before the HyperCard QuickTime tool will function.

• System 7.0 or better, and Apple QuickTime extension 1.0 or later.

• HyperCard 2.1 or later (HyperCard memory allocation must be 2MB or more.)

HyperCard: How It Does Math (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: How It Does Math (7/92)

==========

Article Created: 24 March 1992
Article Reviewed/Updated: 23 July 1992

TOPIC --

This article has four sections:
- HyperCard Uses SANE
- Floating-point Numbers
- NaNs and INFs
- Mixing Reals and Integers

(A related Tech Info Library article deals with HyperCard's round, trunc, and random functions.)

DISCUSSION --

HyperCard Uses SANE

HyperCard uses SANE (Standard Apple Numerics Environment) routines for doing math in HyperTalk. See Apple Numerics Manual, Second Edition, for any details.

Floating-point Numbers

Any floating-point (or real) number used by HyperCard is stored as an extended type. Each number is represented in 80 bits (10 bytes) and has a precision of roughly 19-20 decimal places. Because an extended type is allotted a fixed amount of memory, only a finite number of values can be represented exactly.

Example: type "1000000000000000000+1" into the message box. HyperCard evaluates this expression to 10000000000000000000.

NaNs and INFs

Calculations via SANE can produce infinities and NaNs (Not-a-Number). Such

results may be passed back in HyperTalk. Consult the Apple Numerics Manual for the specifics.

Examples in HyperCard:
sqrt(-1)-> "NAN(001)"
ln(0)-> "INF"
ln(-1)-> "NAN(036)"
-1/0-> "-INF"
(-1)^(-.5)-> "NAN(037)"
1/ln(0)-> 0

Mixing Reals and Integers

HyperTalk, being an untyped language, lets scripters mix real and integer values. Sometimes this can produce unexpected results.

Examples:
(.3 * 10) DIV 1-> 2
(.3 * 10) MOD 1-> 1
trunc(.59*100) < 59-> true

The reason behind the unexpected result is that, internally, HyperCard is applying the math operations to extended type numbers. For example, ".3*10" is not equal to 3 (because .3 cannot be represented exactly by an extended type). The solution to such problems is to have HyperCard evaluate expressions first. This can be accomplished by putting the value into a field or by taking the value of the expression. Evaluating an expression converts it to a "practical" precision (using the numberFormat property).

Example:
value(.3*10) DIV 1-> 3

This behavior is exactly what one would expect if doing math in any high-level language. Both of the following, the first in Pascal and the second in HyperTalk, produce the same results:

```
program Math;

var
    x:extended;
    factor, truncX, K: integer;

begin
    ShowText;{ for THINK Pascal }
     factor := 1000;
     x := 0.0;
     for K := 1 to factor do
    begin
              x := K / factor;
             truncX := trunc( factor * x );
             if (truncX <> K) then
           writeln(K);
     end;
```

```
end.

on mouseUp
   set cursor to watch
   put 1000 into factor
   put EMPTY into cd field "Table"
   put EMPTY into theTable
    repeat with K = 1 to 1000
       put K/factor into x
        if (trunc(factor*x) <> K) then
             put K & return after theTable
       end if
    end repeat
     put theTable into cd field "Table"
end mouseUp
```

Both of these produce the list:

```
1
2
4
8
16
32
63
64
126
128
252
256
504
507
512
```

HyperCard: Calculating Interval Between Two Dates (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Calculating Interval Between Two Dates (7/92)

==========

Article Created: 19 November 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

Here's a handler that calculate the number of days, hours, and minutes between any two dates.

DISCUSSION --------------------

1) Create five fields, one for the first date, one for the second date, and the other three for days, hours and minutes.

2) Use the following handler:

```
on mouseUp
  global numdays,numhours,numminutes,temp
  put "" into cd fld 3
  put "" into cd fld 4
  put "" into cd fld 5
  put cd fld 1 into firstdate
  put cd fld 2 into seconddate
  convert firstdate to seconds
  convert seconddate to seconds
  put seconddate - firstdate into temp
  --how many days worth of seconds
  put 24 * 60 * 60 into secdays
  put temp div secdays into numdays
  put numdays & "days" into cd fld 3
  --check for hours
  put temp-secdays*numdays into temp
  if temp = 0 then put "0 hours" into cd fld 4
  if tem >0 then
    put 60*60 into sechours
    put temp div sechours into numhours
    put numhours & "hours" into cd fld 4
```

```
    --check for minutes
    put temp-sechours*numhours into temp
  end if
  if temp=0 then put "0 minutes" into cd fld 5
  if temp > 0 then
    put 60 into secminutes
    put temp div secminutes into numminutes
    put numminutes & " minutes" into cd fld 5
  end if
end mouseUp
```

HyperCard 2.x: Keyboard Problem on Macintosh Plus (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard 2.x: Keyboard Problem on Macintosh Plus (7/92)

==========

Article Created: 26 September 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

The =, /, * , and + keys on the Macintosh Plus keyboard do not produce these characters when typed. Instead, they act as arrow keys. (If you look at the Macintosh Hardware Manual, these keys match the "arrow keys" on the original Macintosh 128/512 keypad. Also, the keycodes/charcodes match the arrow keys on the Macintosh Plus keyboard.)

This article provides a workaround.

DISCUSSION ----------

If you trap for all keystrokes with a keydown handler and test for the problem keys, you can make them work properly:

```
on Keydown whichKey
  if whichKey = "*" or whichKey  = "/" or  whichKey = "=" or whichKey  = "+"
  then type whichKey
else
  pass keydown
end keydown
```

HyperCard: MacinTalk and Speech Recognition (9/95)

Revised: 9/1/95
Security: Everyone

HyperCard: MacinTalk and Speech Recognition (9/95)

==========

Article Created: 11 June 1990
Article Reviewed/Updated: 1 September 1995

TOPIC ----------

Is there anyone out there who has, or knows of, specific XCMDs for HyperCard that make use of the MacinTalk speech synthesis file?

On a similar note, has MacinTalk ever been updated beyond 1.3.1?

DISCUSSION ----------

MacinTalk is used in combination with Apple's Text to Speech software. It enables your Macintosh to provide Text to Speech capabilities for applications that support Text to Speech. SimpleText is an example of an application that supports Text to Speech.

HyperCard 2.2 supports sound better than HyperCard 2.1. There is an XCMD available from Jeff Iverson Software of Burnsville, Minn. that supports HyperCard 2.2 with Sound Manager 3.0.

HyperCard 2.3 does support Text to Speech and includes speech commands.

As of this writing, the current versions of MacinTalk are:

MacinTalk 2 v1.4
MacinTalk 3 v1.4
MacinTalk Pro v1.4
Speech Manager v1.4

Use the search string "plaintalk and macintalk" to locate the TIL article "PlainTalk and MacinTalk: Differences and When to Use" to determine which version of MacinTalk is supported on your computer.

Article Change History:

01 Sep 1995 - Updated article for MacinTalk 3 and HyperCard 2.3.
14 Sep 1994 - Updated article for MacinTalk 2 and MacinTalk Pro.
23 May 1994 - Merged three articles into one. Added third party information.

HyperCard 2.1: Tools and Font Menus Can't Be Disabled (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard 2.1: Tools and Font Menus Can't Be Disabled (7/92)

==========

Article Created: 12 August 1991
Article Reviewed/Updated: 22 November 1993

TOPIC ----------

In HyperCard 2.1, you cannot use the disable menu command to disable either the Tools or Font menus. You can disable all other menus except the Balloon Help & Applications list menus.

DISCUSSION ----------

These menus could be disabled in HyperCard 2.0v2, and can be disabled in HyperCard 2.2.

The Tools and the Font menu can be deleted in HyperCard 2.1 via a script.

HyperCard: How To Pass a Mouse Click Through a Picture (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: How To Pass a Mouse Click Through a Picture (7/92)

==========

Article Created: 30 October 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

You can write a script in HyperCard that will allow you to click on a color picture generated by the Picture command, and 'pass' the click to whatever object lies underneath it.

DISCUSSION ----------

Simply use a handler like the following:

```
on mouseUpInPicture wName, cloc
  add (item 1 of loc of window wname) to item 1 of cloc
  add (item 2 of loc of window wName) to item 2 of cloc
  click at cloc
end mouseUpInPicture
```

So when you click on a picture window, this script will actually click on whatever is directly underneath the picture.

The idea of the script is that the cloc parameter of the mouseUpInPicture message refers to a location within the window generated by the Picture command, and NOT to a coordinate on the card itself. However, if we tell HyperCard to click someplace, it will always use the current card for that. So all we have to do is add the LOC of the window (which is expressed in terms of the card as a whole) to the CLOC of the window (which is the area within the window that we clicked) to find the exact spot on the card underneath the picture that is physically the same as the location of the spot we clicked on the picture.

HyperCard: MouseDown in Palettes (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: MouseDown in Palettes (7/92)

==========

Article Created: 31 July 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

In some circumstance a user might want to create a button on a palette that performs a constant action while the mouse button is down: for example, a video disc control with a fast-forward button that fast forwards as the button is down, then resumes playing at normal speed when the mouse is up.

DISCUSSION --------------------

1) If you make sure the "Remain Hilited" check is checked, the palette button will be activated on a mouseDown. This does mean we have to do some additional work to make sure that the button hilite is set to false later, but you will see this in just a second.

2) Create a one-line script, in the button, that will repeat through the fast-forward (or whatever) XCMD. The line should look something like this:

```
do("repeat until the mouse is up" & return & "beep" & return & "end repeat"¬
& return & "set hilitedButton of window bob to 0")
```

This script uses a beep instead of a fast forward, but replacing the two would create the desired results.

HyperCard Before 2.2: Open File Undocumented Features (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard Before 2.2: Open File Undocumented Features (7/92)

==========

Article Created: 1 March 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

This article describes some undocumented features in the open file procedures in HyperCard.

DISCUSSION ----------

The open file command opens, reads from, writes to, or creates text files on your Macintosh. HyperCard has a limit of three open files at one time.

Although this limitation is documented in the book "HyperTalk 2.0" by Kamins and Winkler, they wrongly inform the user that when a fourth file is opened an error message will appear: "Can't open any more files." They go on to say that when the user clicks the error dialog away, the open files will close, allowing any other files to be opened/created. This is not the case. The dialog never shows.

HyperCard displays an error message only when it tries to write to, or close a file (the fourth on...). "File not open." It will not alert you that your fourth file couldn't be opened in the first place.

Users must be careful to balance their opened files when writing scripts that use this command extensively.

HyperCard: No Error Messages from Palette Buttons (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: No Error Messages from Palette Buttons (7/92)

==========

Article Created: 31 July 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

A message sent by a button on a palette seems to disappear, neither correct response nor error message. Checkpoints added to handler are not triggered when the palette button is clicked.

DISCUSSION ----------

Cause: Error messages are not issued by HyperTalk when processing messages from palettes. This causes palettes to appear disabled when carried into irrelevant environments, rather than seeming to have malfunctioned. If the problem is a runtime error, it can be detected by checkpoints in the handler; however, if it is a compilation error (in the nature of "can't understand"), the message is intercepted, but no handler is executed.

Workaround: Create a card button that sends the same message. This allows normal debugging of the problem handler. When you're finished, remove the card button.

HyperCard: Palette Design Shortcut (7/92)

==========

Article Created: 30 July 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

When using the Palette Maker in the Power Tools stack, you have to create a card graphic for the appearance of the palette. The intuitive way to control the appearance of a new palette is by selection of button styles and icons, but Palette Maker ignores them.

DISCUSSION --------------------

You can convert an arrangement of buttons into a graphic for use by the Palette Maker. Choose the select tool, drag a box around the buttons, choose Export Paint from the File menu, and park the exported file any place handy. Then Import Paint the same file. This creates a graphic which is an image of the originally selected area, including buttons, fields, and previously existing graphics (card and background).

HyperCard: PICT Compression (8/93)

Revised: 12/21/93
Security: Everyone

HyperCard: PICT Compression (8/93)

==========

Article Created: 30 March 1992
Article Reviewed/Updated: 2 August 1993

TOPIC --------------------

The HyperCard Picture XCMD can open up compressed PICTs created with QuickTime. This is done by making a toolbox call (DrawPicture). QuickTime intercepts the call and does any decompression necessary.

DISCUSSION --------------------

Here are some factors that seem to affect the speed of the Picture XCMD:
- The amount of RAM allocated to HyperCard.
- The size of the picture file.
- The type of compression used.
- The parameters you pass to the Picture XCMD.

The method used to compress an image affects its final size and the speed of decompression. Faster display speed may be achieved by allocating more memory to HyperCard. However, the method of compression is a more important factor.

The Picture XCMD seems to be able to display files quicker if you do not pass a parameter for bit-depth (fifth param). Do so only if memory conservation is important. Instead, let the XCMD figure it out the appropriate bit-depth. If you try to display a file at a lower bit depth, it takes time to convert.

If you pass 0 for the bit-depth parameter, then the XCMD does not set up an offscreen buffer. Hence, the window will seem to appear immediately, but the picture may take some time to get drawn into the window (it is drawn as it is decompressed). This method will give you slower updates.

HyperCard: Preventing the Moving of Windows (4/93)

Revised: 12/21/93
Security: Everyone

HyperCard: Preventing the Moving of Windows (4/93)

==========

Article Created: 30 March 1992
Article Reviewed/Updated: 13 April 1993

TOPIC --------------------

HyperCard 2.0 added the system messages moveWindow and sizeWindow to HyperTalk. Some scripters expect to be able to prevent a user from moving a window (via dragging) by intercepting a moveWindow message. This is not possible.

DISCUSSION --------------------

The moveWindow message is sent to the current card whenever the location of any stack window changes. MoveWindow is a system message, so it serves only to notify that an event has happened, not that it is going to happen if the message reaches HyperCard.

Scripters can use a moveWindow handler to figure out how to reposition other windows.

One way to prevent users from dragging windows is to hide the titlebar of the card window. Use hide titlebar. Restore the titlebar later with show titlebar. Note that any stack that opens in that same window will not have a titlebar (so scripters want to restore the titlebar on closeStack and suspendStack). The command will not affect other windows displaying stacks.

HyperCard: Quotes in Pathname (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Quotes in Pathname (7/92)

==========

Article Created: 12 August 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --

Some of the stacks provided with HyperCard 2.x do not function properly if the volume name contains quotes (" ").

DISCUSSION --

Quotes in the volume name cause problems in the HyperCard Reference stack as well as any other stack that gets the Long Name of the stack and tries to extract a word from it (second word in the case of the Reference stack).

Errors returned will vary from menu not found errors to missing handler errors like "Can't understand 'FindInTitle'". For the technically oriented, this is because the Reference stack will never open using the "HyperCard Help" stack because the wrongStack function in the openstack command does not function properly -- for reasons stated above.

The solution: Take the quotes out of the volume (HD or floppy) name as well as any folders in the path.

HyperCard: Round, Trunc, and Random Functions (7/92)

==========

Article Created: 24 March 1992
Article Reviewed/Updated: 23 July 1992

TOPIC --

This article has two sections:
• The Round and Trunc Functions
• The Random Function

(A related Tech Info Library article describes how HyperCard does Math. It deals with SANE, floating-point numbers, NaNs and INFs, and mixing reals and integers.)

DISCUSSION --

The round and trunc Functions

The round and trunc HyperTalk functions have a long integer range. If passed a number outside this range — less than -231 or greater than 231 - 1 — these functions will return –2147483648 (i.e., -231).

The trunc function rounds toward zero, so that any fractional part is removed. Examples: trunc(2.2) -> 2 ; trunc(-2.2) -> -2.

The round function in HyperCard rounds "to nearest" (see the Apple Numerics Manual). (It is also known as a statistical round.) "To nearest" refers to a number's binary representation. This method is not the usual "round" that we learn in school. Whenever a number is exactly halfway between integers (e.g., 2.5), the "usual" round will round up. The round will round toward the even integer, e.g., round(2.5) -> 2. NOTE: Scripters may notice unexpected results when the numberFormat is imposed upon an expression. Similar rounding occurs in this instance (and it's harder to predict the rounding direction when dealing with fractions).

The random Function

The random function in HyperTalk produces pseudo-random numbers. In HyperCard 1.x, the random function had an integer (e.g., 215 - 1) range. In HyperCard 2.x, this was extended to a long integer range. (It calls SANE directly — using RandomX.) If passed an argument outside its range, the random function will use the maximum instead.

If a non-integer number is passed to random, HyperCard effectively rounds up before returning a random number. If a number less than 1 is passed to random, HyperCard returns 1.

HyperCard: SCSI Probe Interfere's with Command-Space Bar (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: SCSI Probe Interfere's with Command-Space Bar (7/92)

==========

Article Created: 16 September 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

The Command-Spacebar keystroke normally hides or displays the menu bar in HyperCard. If, instead, the cursor changes to a watch and the menu bar does not hide/display, the cause may be a Control Panel document in the System Folder called SCSI Probe.

DISCUSSION ----------

SCSI Probe uses Command-Spacebar to mount hard drive volumes. To fix the problem, change the keyboard shortcut for SCSI Probe to something else. (You won't need to restart the computer.)

HyperCard: sharedhilite to True May Limit Button Control (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: sharedhilite to True May Limit Button Control (7/92)

==========

Article Created: 28 April 1992
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

From a script, setting the sharedHilite of a background button to true, then setting the hilite of the button to true, then setting the sharedHilite for that button to false, prevents further script control of the button.

DISCUSSION ----------

This series of steps may be followed if someone wants to quickly set several background buttons of a stack to hilite = true without having to visit each card individually. The button type and characteristics (show name, auto hilite, etc.) have no effect on this problem.

The only way to fix the button is to click on it with the button tool and change any of the button's characteristics in the button info dialog box. The button hilite will once again respond to script control until the above steps are repeated.

HyperCard: Using Field-to-Message Feature (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Using Field-to-Message Feature (7/92)

==========

Article Created: 15 November 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

There is a feature in HyperCard that allows you to pick up text and transfer it to the message box. Holding the Command key down while the cursor is in a field (locked or unlocked) will change the cursor to a hand and draw a one-pixel selection box around the text. The selection box will grow, one word at a time, as you drag through the text. When you release the mouse button, the selected text will be placed in the message box.

DISCUSSION ----------

This feature is hard-coded into HyperCard and can't be bypassed through HyperTalk. First of all, in an unlocked field you will never be able to retain the I-beam pointer (insertion point) when the Command key is down, because some idle message will slip through to HyperCard creating a blinking hand to I-beam cursor.

And you can't trap the mousedown in an unlocked field. However, even if you try to trap the mousedown in a locked field and exit to HyperCard after your defined action, the text will still be picked up and placed in the message box.

HyperCard 2.0v2: The Suspended Global Variable (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard 2.0v2: "The Suspended" Global Variable (7/92)

==========

Article Created: 23 April 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Here's an undocumented feature of HyperCard 2.0v2. It's a built in global variable called "the suspended." This variable is normally false but is set to true when you open another application using the open[filename with] application command.

DISCUSSION ----------

This is an important feature if you are running under MultiFinder and start a handler that uses the open application command with additional messages after the open command. What will happen is that HyperCard will start launching the application and then continue to finish the other commands while it is running in the background. Therefore, if you want to suspend any pending commands that follow the open application command until after HyperCard gains control you might want to use the following structure:

```
on exampleHandler
   open "Text File" with "MacWrite II"
   wait 1 second -- assure following loop works
   repeat until var is false
     put the suspended into var
   end repeat
   beep
   go next card
end exampleHandler
```

HyperCard: Send Can't Be Trapped (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: "Send" Can't Be Trapped (7/92)

==========

Article Created: 30 March 1992
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Why can't the Send command be trapped?

DISCUSSION ----------

Send isn't a command; it's a keyword, like if, do, etc., and the designers of HyperTalk didn't allow keywords to be trapped by handlers in the same way that commands can be trapped.

Perhaps the simplest way to explain the difference between keywords and commands is that keywords force the compiler to do something out of the ordinary. In the case of "send", the target for the message is potentially different from the default target, so the compiler has to do some extra work to figure out where to send the message.

HyperCard: Trunc() Function Limitation (7/92)

Revised: 12/21/93
Security: Everyone

HyperCard: Trunc() Function Limitation (7/92)

==========

Article Created: 30 January 1992
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

The trunc() function may not return correct values when you supply a parameter greater than or equal to 2^31 (2147483648).

For example:

```
trunc(9876543210/2) = -2147483647
trunc(22222222222) = -2147483647
```

DISCUSSION --------------------

This accuracy problem seems to be related to limitations in the way HyperCard handles SANE routines.

HyperCard: Rare Problem with Visual Effects (1/93)

Revised: 12/21/93
Security: Everyone

HyperCard: Rare Problem with Visual Effects (1/93)

==========

Article Created: 27 September 1991
Article Reviewed/Updated: 22 January 1993

TOPIC ----------

Visual effects cause HyperCard 2.0v1, 2.0v2, and 2.1 to crash if:
• Part of the card is overlapping another display, and
• The display is set to 1-bit depth (monochrome).

DISCUSSION ----------

This has been observed on a Macintosh LC and IIfx, and on PowerBooks. Crashing has not been reproduced on the Macintosh IIsi or Macintosh Classic, nor on any of the pre-IIfx models, though potentially these may be a problem (particularly with third-party video cards).

The crashes do not always occur in the situation described above, and may vary with the system version. It may also depend upon the amount of card area that's not showing through the card window. The best reproducibility occurs when your card rect is very tall (taller than the monitor) and the card window is smaller than the card rect.

AppleScript Scripter's Kit: Description (12/93)

Revised: 12/13/93
Security: Everyone

AppleScript Scripter's Kit: Description (12/93)

==========

Article Created: 13 December 1993

TOPIC -----

The AppleScript Scripter's Kit allows integrating off-the-shelf applications across desktops and networks for increased productivity.

DISCUSSION -----

The AppleScript Scripter's Kit is a software tool that enables end-users to integrate elements of commercial Macintosh software applications across desktops and networks. Since April 1993, AppleScript has been available as a software developer's kit for commercial software developers.

The AppleScript scripting language is integrated into the Macintosh operating system and conforms to Apple's cross-platform Open Scripting Architecture (OSA) standard. Developed in cooperation with third-party developers, the OSA provides a standard way for mainstream applications to interact with any scripting system. OpenDoc is a compound document architecture that enables users to create compound, customizable documents.

AppleScript is an element of Apple's long-term strategy to automate the Macintosh computing environment, improve application interaction and provide a foundation technology for OpenDoc. It builds on System 7 and the cross-platform Open Scripting Architecture (OSA), paving the way toward OpenDoc. The AppleScript Scripter's Kit, targeted at solution providers and end users, contains:

- AppleScript 1.1, an enhanced version of Apple's scripting language.
- An enhanced script editor that automatically generates and edits scripts based on user's actions.
- An interface processor from Software Designs Unlimited, Inc. that

enables building custom interfaces for scripts.

- Support for multiple dialects that provides for scripting in non-English languages (French and Japanese are included).

- A redistribution license for AppleScript system software and interface processor runtime code.

Automation Features

The AppleScript scripting language enables users to tightly integrate the functionality of standard, off-the-shelf applications as well as in-house, enterprise-wide programs to build customized scripts that automate business processes and increase productivity.

For example, with AppleScript, a sales department can automatically generate a weekly report that invokes functions from a series of scriptable applications such as Microsoft Excel, FileMaker Pro and QuarkXPress. AppleScript can gather data from one application, process it in another, and present it in a third automatically at a given time or based on an event, locally or over a network. Before AppleScript, these time-consuming functions needed to be performed manually by launching and working directly in each individual application.

"Scriptable" Applications

Since the AppleScript Software Developer's Kit was introduced in April 1993, over 80 independent software vendors (ISVs) are shipping AppleScript-aware applications. ISVs that provide scriptable applications include: Aldus, Beyond, Claris, Great Plains, Microsoft, Quark, Symantec, UserLand and WordPerfect among others. AppleScript helps ISVs reduce development time and costs by removing the need to create a proprietary scripting language.

How the Software Developer's Kit Differs

The AppleScript Developer's Kit for commercial developers includes the AppleScript Scripter's Kit plus a pre-release version of the scriptable Finder and development tools and a CD-ROM with additional documentation, sample code, and scripts. Apple also licenses the AppleScript runtime software and the script editor to commercial developers for shipment with their products.

Requirements

The AppleScript kits require System 7.0 or later and applications that are scriptable or recordable according to Apple's Open Scripting Architecture.

Compatibility

Compiled scripts created with AppleScript 1.0 may not run under

AppleScript 1.1. Scripters will either need to edit the compiled scripts or recompile scripts from their original text form under version 1.1.

Availability

Here are the order numbers for the AppleScript kits: AppleScript Scripter's Kit 1.1 (M1730LL/A) AppleScript Software Development Toolkit 1.1 (R0175LL/B) AppleScript Software Development Toolkit 1.1 Upgrade (R0557LL/A)

Volume purchases of site licenses are available for the AppleScript Scripter's Kit through the Apple volume licensing program. You can order the kit through software resellers, Apple authorized resellers and APDA -- Apple's source for developer tools. Advanced scripting support is available for a fee by calling (800) 950-2442.

AppleScript 1.0 is bundled with Quadra AV computers and comes as an enabling technology of System 7 Pro. Customers who own either or both of these products must purchase the AppleScript Scripter's Kit 1.1 in order to acquire AppleScript 1.1.

AppleScript: Scriptable Applications (1/95)

Revised: 1/18/95
Security: Everyone

AppleScript: Scriptable Applications (1/95)

==========

Article Created: 13 December 1993
Article Reviewed/Updated: 18 January 1995

TOPIC --------------------

Currently there are many software development companies that make their application AppleScript scriptable. This article tells you how to determine if your application is AppleScript aware, and provides a partial list of known AppleScript aware applications.

DISCUSSION --------------------

Rather than trying to maintain a list of Apple Event-aware applications that would constantly be changing, we recommend using the following procedure to determine whether an application is Apple Event-aware.

Use the Script Editor that comes with the AppleScript software. Choose the Open Dictionary option under the File menu. Only Apple Event-aware applications will appear on the list of applications that AppleScript can open.

You can also call the software manufacturer to ask about Apple Event-aware status.

AppleScript is a system-software-level scripting facility that enables users to integrate the functionality of different applications into a custom solution designed to meet specialized needs.

New vendors announcing support for AppleScript represent a broad range of business and productivity software applications. Here is a partial listing:

ACIUS, Inc.
Advanced Software, Inc.
After Hours Software
Aladdin Systems
Aldus Corporation
Beyond Incorporated

Caere Corporation
Cambridge Science

HyperCard 2.2: Color and Media Integration (12/93)

Revised: 12/13/93
Security: Everyone

HyperCard 2.2: Color and Media Integration (12/93)

==========

Article Created: 13 December 1993

TOPIC --

This article, extracted from the Apple press release announcing HyperCard 2.2, describes the new Color Tools and media integration features.

DISCUSSION --

HyperCard's new Color Tools enhance the usability and visual appeal of existing and new solutions. In addition to importing and resizing color PICT graphics, users can select from a palette of 256 shades to color HyperCard elements such as buttons, fields, cards, and backgrounds. HyperCard's QuickTime tools allow users to incorporate movies into cards and stacks with point and click simplicity.

HyperCard continues to help multimedia authors differentiate their product by providing comprehensive multimedia capabilities in one environment. With ADDmotion II, HyperCard 2.2 facilitates easy media, color, and sound editing to help users enhance the value of new and existing stacks. ADDmotion II is a 24-bit color paint, animation and sound extension that integrates seamlessly into HyperCard and provides tools for controlling and editing animations and sounds.

HyperCard: Again Supported by Apple (1/94)

==========

Article Created: 13 December 1993
Article Reviewed/Updated: 28 January 1994

TOPIC ----------

Starting December 13, 1993, HyperCard is again sold and supported by Apple Computer. Apple will offer both pre-sales and technical support. This article outlines the levels of HyperCard support offered, and how they can be ordered.

DISCUSSION ----------

Presales Support

For pre-sales support, call the Apple Assistance Center at 1-800-SOS-APPL (1-800-767-2775).

Up and Running Support

Up and running support will be offered free of charge by Apple via the Apple Assistance Center at 1-800-SOS-APPL. Up and Running support includes:
• Help with installation, compatibility, and configuration
• Basic product use: tools, menus, and command syntax

Up and running support is available Monday through Friday from 6 a.m to 6 p.m. Pacific time.

Advanced HyperCard Support (Scripting Support)

Apple will answer scripting questions, on a fee basis, for the current version, and for the immediately preceding version, of HyperCard and AppleScript. At this writing, that means HyperCard 2.1 and 2.2, and AppleScript 1.0 and 1.1.

Scripting support for HyperCard versions before 2.1 will be provided on a best-effort basis. If support cannot be provided, customers will not be

charged.

HyperCard scripting support includes: creating, modifying, and debugging stacks; and using HyperTalk commands.

Not included: stack concept and design, writing and using XCMDs (external commands), project management, or consultation.

Scripting support is available Monday through Friday from 6 a.m to 6 p.m. Pacific time. To order, call Apple at 1-800-950-2442.

Programming-Level Support

For programming-level development support, including use of XCMDs and OSAX, the Apple Macintosh Technology Partners Program is available. For information and/or an application, call the Developer Support Center at 1-408-974-4897.

Article Change History:
28 January 1994 - Scripting Support section re-worded.

Quadra 660AV: Capturing Video Frame Problem (12/93)

Revised: 12/13/93
Security: Everyone

Quadra 660AV: Capturing Video Frame Problem (12/93)

==========

Article Created: 13 December 1993

TOPIC -----

I'm trying to capture a video frame at 640 x 480 using the Video Monitor application. Video Monitor will not let me capture a video frame while my monitor is set to Thousands of Colors. I must set my monitor to 256 colors (8-Bit) to capture a frame of video. How many colors will my frame capture contain once it is saved to the hard disk?

DISCUSSION -----

The Macintosh Centris 660AV and Quadra 660AV come with 1MB of VRAM on the logic board, which is not expandable. When bringing video into the Centris 660AV and Quadra 660AV, you must set your monitor to 256 Colors (8-Bit) when using both Video Monitor and FusionRecorder. Even though your monitor is set to 256 Colors (8-Bit), you will be capturing your image or movie in Thousands of Colors (16-Bit).

DAL for AWS 95: DALInstall Requires 'whoami' (12/93)

Revised: 12/17/93
Security: Everyone

DAL for AWS 95: DALInstall Requires 'whoami' (12/93)

==========

Article Created: 13 December 1993

TOPIC -----

I have DAL 1.4 for the Apple Workgroup Server (AWS) 95. I am trying to install DAL and have it work with Oracle 7. I have followed the instructions, creating the directories, and so on, and then run DALInstall. I get the following error message: DALInstall: whoami not found.

Do you know what is the problem? Do you have any suggestions?

DISCUSSION -----

AAWS 95 installation does not install 'whoami' automatically. The instructions for installing DAL 1.4 on the AWS 95 did not include the information about installing 'whoami'. Once you install 'whoami' everything will work fine. We will forward this information for inclusion in the DALInstall instructions.

DAL/VMS 1.4-Invalid Username/Psswd Error, ADSP Connect (12/93)

Revised: 1/11/94
Security: Everyone

DAL/VMS 1.4-Invalid Username/Psswd Error, ADSP Connect (12/93)

==========

Article Created: 13 December 1993

TOPIC ----------

I'm having a problem with DAL for VMS 1.4. Whenever I try to connect I get an error message which indicates an invalid username or password. I was able to use MacTerminal and the c-term tool to connect to the VAX. I used the same userid and password and was able to log on to the system. What am I missing?

DISCUSSION ----------

If you confirm that your username and password are good, one cause of this error message is the "Restricted" flag being set on the UAF record. When you consult the VAX/VMS documentation, it is vague and does not present the flag as a problem. By unsetting this flag, this problem often goes away.

AV Series: 800K ProDOS Disks and Apple File Exchange (4/95)

Revised: 4/3/95
Security: Everyone

AV Series: 800K ProDOS Disks and Apple File Exchange (4/95)

==========

Article Created: 14 December 1993
Article Reviewed/Updated: 3 April 1995

TOPIC ----------

I have a large number of 800K ProDOS disks containing AppleWorks GS files which I would like to copy to my Quadra 660AV using Apple File Exchange. However, success in both mounting and reading this disks is inconsistent. At times, it takes two to three minutes to mount the disk for translation within Apple File Exchange. Other times, the disk cannot be read at all.

DISCUSSION ----------

ProDOS disks originally formatted on an Apple IIgs and then inserted into an AV Series Macintosh running Apple File Exchange 7.0 can take up to two or three minutes before the contents of the disk are displayed in the right side window of Apple File Exchange.

However, upon inserting a ProDOS disk Apple File Exchange does not indicate that any activity is taking place. For example, the cursor doesn't change into a watch, menus don't respond, or the floppy is accessed intermittently resulting in the appearance that the Macintosh might have frozen or crashed. Once the ProDOS disk contents are displayed however, complete functionality is restored to the Macintosh.

Therefore, Apple recommends patience when attempting to read ProDOS disks when using Apple File Exchange 7.0. Subsitiuting Macintosh PC Exchange version 2.0 or later for Apple File Exchange is a good alternative to waiting for Apple File Exchange, since Macintosh PC Exchange does recognize ProDOS disk formats. However, any version of PC Exchange prior to 2.0 will not work.

Another work around is connect the Apple IIgs to the Centris 660AV using an AppleTalk network and transferring any ProDOS files to the AV Series Macintosh using System 7.x FileSharing.

Article Change History:

03 Apr 1995 - Added information about PC Exchange 2.0.
21 Jul 1994 - Retitled to better describe article.

Centris/Quadra 660AV: No Heat Sink on the 68040 (4/95)

==========

Article Created: 14 December 1993
Article Reviewed/Updated: 25 April 1995

TOPIC -----

Isn't 68040 CPU (central processing unit) used in the Centris 650 the same as that used in the Centris 660AV and Quadra 660AV?

If so, why is there not a heat sink mounted on the 68040 in the Centris 660AV and Quadra 660AV?

DISCUSSION -----

Both the Centris 650 and the Centris 660AV use a Motorola MC68040 CPU running at 25 MHz.

The original MC68040 25 MHz chips that came from Motorola required the use of a heat sink on the Centris 650 to reduce the amount of heat generated by the chip. A new version of processor now used in Centris 660AV and Quadra 660AV no longer require the heat sink.

Article Change History:
25 Apr 1995 - Corrected spelling of sink.

Quadra 840AV: Personal LaserWriter NTR Printing Problem (12/93)

Revised: 12/14/93
Security: Everyone

Quadra 840AV: Personal LaserWriter NTR Printing Problem (12/93)

==========

Article Created: 14 December 1993

TOPIC ----------

I have a Quadra 840AV connected to a Personal LaserWriter NTR and I cannot print to the LaserWriter. I have checked the connections between the computer and the printer and have the latest version of the Personal LaserWriter NTR driver software installed. When printing, I either get a postscript error and or a message stating that the printer cannot be found.

DISCUSSION ----------

The following steps have proven successful in restoring the ability to print from a Quadra 840AV to a Personal LaserWriter NTR:

1) Ensure Speech Recognition is turned off.

2) Ensure that Virtual Memory is turned off.

3) Check to see if the Printer is connected to the Quadra 840AV's printer port so that the built in LocalTalk connected can be used.

4) Reinstall the printing software for the Personal LaserWriter NTR.

5) Zap the PRAM of the Quadra 840AV (RAM parameter settings). Hold down the Command, option, P and R keys while starting up the Quadra. The Quadra will start up normally but after several seconds will restart once again.

Centris, Quadra 660AV: Video Capture Issues (12/93)

Revised: 12/14/93
Security: Everyone

Centris, Quadra 660AV: Video Capture Issues (12/93)

==========

Article Created: 14 December 1993

TOPIC ----------

I'm attempting to capture quality screen snapshots using the Video Monitor application on my Centris 660AV. I'm experiencing the following strange effects:

1) A black band line (about 3 pixels wide) appears at the bottom of the picture when taking screen snapshots with Video Monitor. This occurs when using both Composite In and S-Video In as the video source. Is there a work around?

2) When capturing S-Video, I get an extremely bright picture when using the lowest video setting in S-Video. When using Composite Video In, it works fine. Is there any way to adjust the brightness beyond the Video Settings?

3) I'm concerned that the Centris 660AV is not utilizing all of the resolution lines that my still camera outputs. The camera is capable of putting out 450 Resolution lines. Does the Centris 660AV utilize all of these lines. Customer is concerned that the Centris 660AV is digitizing with field resolution as opposed to frame resolution. How many of the resolution lines does the Centris 660AV utilize in the Video Monitor application?

DISCUSSION ----------

Of the two Macintosh AV systems (the Centris/Quadra 660AV and the Quadra 840AV), the Quadra 840AV has better capture characteristics largely due to the option to have an additional 1MB of VRAM installed. Given the fact, here are the answers to your questions:

1) The black band is most likely the blanking part of the video frame. The AV digitizer expects a certain number of lines and we've have seen this occur on other video digitizers. The signal contains the blanking

information and is normally outside the display area of the typical television monitors.

Due to the vast amount of history with the NTSC standard, there is some "freedom" about exactly how blanking works. If the number of image lines the AV digitizer is expecting is more than what the source supplies, there will be visible blanking info at the bottom of the image (or at times, on one of the edges).

When capturing still frames it is relatively easy to fix these captured images using an application like Photoshop or Painter. Simply use their tools to Crop out the unwanted area. While not an ideal solution, it is only one available to eliminate this part of the display. Some video capture applications provide a crop rectangle so that cropping can be specified prior to the capture.

2) Based on what the AV expects in a video signal, it is possible to over saturate the bright areas of an image. Over saturatation is easier to introduce with S-video because you have a stronger signal available. Choosing the VCR option (instead of the TV/video disc option) in the video input control panel provides the best setting in such situations. The best way to control the brightness is during the shooting of the video. Keeping the contrast ratio as low as possible will provide the best results.

3) There are two issues to consider in the area of video resolution versus computer pixels. First, the output of the analog video device does not always map directly to the pixel count of the digital device.

Second, concerns the number of pixels that are captured by the AV system. Based on VRAM of 1MB, a true 640x480 image can not be captured. A 640x480 image can be created, but it will use line-doubling from single field to produce the full screen image. To get a full 640x480 image using both fields 2MB of VRAM is required. The 1MB limits the dual field/undoubled line image to 496x372 pixels.

Some additional thoughts to consider on single field versus single frame, which uses both fields: If the capture image is 240 or less lines vertical 1 field is dropped to scale the image. Two examples:

- First case, 1MB VRAM - if the capture image is greater than 240 lines vertical or is equal to/less than 372 lines vertical, then both fields are used. A scalar chip is used to scale the information from the two fields.

- Second case, 2MB VRAM (840AV only) - if the capture image is greater than 240 lines vertical, up to 480 lines vertical, both fields are used. Again a scalar chip is used to scale both fields to the selected image size.

Peter’s Adventure Series: System Requirements (12/93)

Revised: 12/14/93
Security: Everyone

Peter’s Adventure Series: System Requirements (12/93)

==========

Article Created: 14 December 1993

TOPIC -----

What are the system requirements of the Peter's Adventure series of games?

DISCUSSION -----

Peter's Adventure is a series of CD-ROM based games consisting of Peter's Numbers Adventure, Peter's Alphabet Adventure and Peter's Magic Adventure.

The Peter's Adventure series has the following system requirements:

1) A Macintosh LC computer or later with at least 5 megabytes of memory, System 6.0.7 or later, 32-Bit QuickDraw, and QuickTime version 1.5 or later.

2) A Macintosh monitor which displays at least 640 by 480 pixels and 256 colors.

3) A Macintosh-compatible CD-ROM drive.

4) 2560K allocated memory for Peter's Numbers Adventure and Peter's Magic Adventure, and 3072K allocated memory for Peter's Alphabet Adventure.

QuickTime Version

If you do not have QuickTime installed, you will see an error message. Note that each of the Peter's Great Adventure CDs has QuickTime v 1.6, which you can drag to the Extensions Folder inside your Macintosh's System Folder if you don't currently have QuickTime.

Number of Colors

If your Macintosh computer is not set to 256 color mode, you will receive an

error message. To set your Macintosh to display 256 colors, follow these steps:

1) Select Control Panel from the Apple Menu, then double-click on Monitors.

2) Select 256 and click on Color in the Monitor Control Panel, then close the control panel by clicking the close-box.

If your Macintosh does not support 256 colors, you must add VRAM or a video board that supports 256 colors.

Number of Pixels

If your monitor does not display at least 640 by 480 pixels, you will receive an error message. You must attach such a monitor to your Macintosh to play Peter's Adventure.

Memory

If you do not have enough memory available, your system may suddenly "crash" or stop operating. If this happens, follow these steps:

1) Go to the Finder and select About this Macintosh from the Apple Menu. The largest unused block must be at least 2560K for Peter's Numbers Adventure and Peter's Magic Adventure, and 3072K for Peter's Alphabet Adventure.

2) If you do not have this much memory, remove extensions and/or control panels that are not needed to run Peter's Adventure. Do NOT remove the QuickTime extension.

Note that using Virtual Memory will cause Peter's Adventure to run erratically and is not recommended.

Peter’s Adventure Series: Icon Missing from Desktop (12/93)

Revised: 12/14/93
Security: Everyone

Peter’s Adventure Series: Icon Missing from Desktop (12/93)

==========

Article Created: 14 December 1993

TOPIC --------------------

Why can’t I see the Peter's Adventure icon on my Desktop?

DISCUSSION --------------------

Check your system for the following conditions:

1) Ensure that your CD-ROM drive is turned on and plugged into an live electrical outlet.

2) Ensure the CD-ROM drive is properly connected to your Macintosh computer's SCSI port (consult your CD-ROM drive’s manual for instruction).

3) Ensure the CD-ROM drive’s SCSI ID number does not conflict with another SCSI device’s ID number (consult your CD-ROM drive’s manual for further information).

4) Ensure all CD-ROM drivers are installed.

5) Turn on your CD-ROM drive before your turn on your Macintosh. If your CD-ROM drive is already turned on, restart your Macintosh.

6) Use another CD-ROM disc. This will narrow down the problem to either the your system set-up or your CD-ROM disc.

Peter's Adventure Series: Erratic Sound and Animation (12/95)

Revised: 12/12/95
Security: Everyone

Peter's Adventure Series: Erratic Sound and Animation (12/95)

==========

Article Created: 14 December 1993
Article Reviewed/Updated: 12 December 1995

TOPIC ----------

Why does the sound and animation in the Peter's Adventure series play erratically?

DISCUSSION ----------

Erratic sound and animation can be caused by the following phenomena:

1) The CD-ROM itself may be dirty (fingerprints, dust, etc.). Clean your CD-ROM with a dry, soft, lint-free cloth. Be sure to wipe from the center of the CD straight out (not in a circular motion around the disk).

2) There may be applications running in the background on your Macintosh. You must quit other all applications.

3) You may have turned on File Sharing. Ensure that File Sharing is off before running Peter's Adventure.

4) You may turned on Virtual Memory. Ensure that Virtual Memory is off. If you do not have enough memory, add additional memory

5) If you are using an older and/or slower Macintosh such as an LC or LC II, Peter's Adventure may occasionally behave erratically. If you are planning on using a significant amount of CD-ROM multimedia and want optimum performance, consider upgrading.

6) If you are using an early or single speed CD player, such as an AppleCD SC, AppleCD 150, or PowerCD, Peter's Adventure may behave erratically. You may want to consider upgrading to an AppleCD 300.

7) The Sound Manager 3.0 extension may cause erratic sound with Peter's Adventure Series CD-ROM discs. The only workaround is to remove the Sound

Manager 3.0 extension from the Extensions folder of your System Folder and restart your computer before running a Peter's Adventure disc.

Article Change History:
12 Dec 1995 - Added Sound Manager 3.0 information.
07 Sep 1995 - Made minor corrections.

AWS 95, AppleShare Pro and Non-root Users (12/93)

Revised: 12/14/93
Security: Everyone

AWS 95, AppleShare Pro and Non-root Users (12/93)

==========

Article Created: 14 December 1993

TOPIC ----------

This article describes why the Apple Workgroup Server (AWS) 95 will not allow non-root users to run AppleShare Pro. Also the use of a screen saver with password protection will provide security.

DISCUSSION ----------

There are no plans to implement support for non-root users to run AppleShare Pro on the AWS 95. Its implementation has been investigated and the effort necessary to make such a change would be great.

Several factors were considered before arriving at this decision. Since AppleShare Pro requires write access to the "/" volume for the creation of the PDS file, it needs to be a root process. Other administrative functions require root access as well. For example, mounting file systems, initializing a hard disk, making a new file system, the creation of a new kernel, modifying the A/UX Buffer Cache which changes the A/UX kernel, and so on.

If the AWS 95 is in a situation where security is a concern, we suggest the use of a screen saver which allows for password protection. You must use a module that does not require CPU cycles to work. For example, AfterDark, using the FadeAway module with the SystemIQ monitor enabled. Any other AfterDark module will affect the server performance.

Using America Online with a GeoPort Modem (11/94)

Revised: 11/30/94
Security: Everyone

Using America Online with a GeoPort Modem (11/94)

==========

Article Created: 14 December 1993
Article Reviewed/Updated: 29 November 1994

TOPIC ----------

This article explains how to set up your GeoPort modem to connect to America Online (AOL).

DISCUSSION ----------

If you have AOL software version 2.51 you should not have any problems connecting. AOL version 2.51 is the version recommended by AOL for the GeoPort modem. The modem set up strings are preconfigured for use with this modem. If you are having problems connecting to America Online with version 2.51, please contact AOL for further assistance.

Using earlier versions of the AOL software can cause the Geoport Telecommunications pod to exhibit a buzzing sound until the pod is disconnected from the computer and reconneted OR until the computer is restarted. This problem would normally be very intermitent.

If you have AOL software prior to version 2.51 and you are having problems connecting to America Online using your GeoPort modem, you may need to take a few simple steps to correct the problem.

1) Go into your Control Panels folder, and double-click on the EXPRESS MODEM Control Panel. Make sure that the "Express Modem:" option is set to "On", and the "Modem Port Setting" option is set to "Use Express Modem".

2) Also in the Control Panels folder, double-click on the "Speech Setup" Control Panel. Make sure that "Speech Recognition" is set to "Off".

3. Finally, you may need to use a "Modem Initialization String" to configure that modem properly for use with America Online.

To enter a modem string in the America Online software:

- Launch America Online by double-clicking the AOL application icon.
- Click on the "Setup" button.
- On the next screen, click on the "Edit Modem Strings" button, and you'll see a screen with 3 (three) boxes for modem strings shown there.
- Enter one of the following strings, in the box labeled "Modem Initialization String":

  AT&F&K0&Q0

  or: AT\N1&Q0

Make sure that the modem string is typed all in capital letters, with no spaces, and always use ZERO for "0", NOT the letter "o".

If you follow all of the steps mentioned above, you should be able to connect to America Online without any further difficulties. If problems persist, see information on this BBS about Software Conflicts, Hard Drive Compression, or other possible problems which may be preventing you from connecting to America Online.

To locate a vendor's address and phone numbers, use the vendor name as the search string.

Article Change History:
29 Nov 1994 - Added information about version 2.51 of AOL.
12 Jul 1994 - Added information about version 2.1 of AOL.

MacTCP 1.1 and Quadra 610 Problem (12/93)

Revised: 12/16/93
Security: Everyone

MacTCP 1.1 and Quadra 610 Problem (12/93)

==========

Article Created: 14 December 1993

TOPIC ----------

I have MacTCP Version 1.1 and NCSA Telnet 2.5. My new Macintosh Quadra 610 is connected to a GatorStar GXR via LocalTalk which is then being routed to Ethernet. Before we had the Quadra 610 we had a Classic II connected in the same location.

Now, MacTCP is defaulting to Ethernet and we can not connect up to the LocalTalk side for connecting to the Ethernet via the GatorStar. When I open up the MacTCP control panel all is see at the top is the Ethernet Driver.

Is there a way to make MacTCP use the AppleTalk port on a Macintosh with on board Ethernet?

DISCUSSION ----------

MacTCP 1.1 is not compatible with System 7.1. MacTCP 1.1.1 or later should be used instead.

The main problem with MacTCP 1.1 and System 7.1 is that MacTCP 1.1 changes some values in low memory that System 7.1 relies on. With these values changed, System 7.1 will sometime crash and possibly corrupt an internal resource.

Also, MacTCP 1.1 does not display the LocalTalk mdev in the MacTCP Control Panel under System 7.1.

Because of this, MacTCP 1.1 and earlier are not recommended or supported under System 7.1. If you continue to use MacTCP 1.1 with System 7.1, you are doing so at their own risk.

StyleWriter Ink Cartridges: Prevent Clogging (12/93)

Revised: 12/16/93
Security: Everyone

StyleWriter Ink Cartridges: Prevent Clogging (12/93)

==========

Article Created: 16 December 1993

TOPIC ----------

The StyleWriter ink cartridges (both StyleWriter & StyleWriter II) are clogging. The print head moves but no ink comes out.

DISCUSSION ----------

This is caused by air in the cartridge. When installing a new cartridge be sure the purge function occurs BEFORE any printing is attempted.

For the StyleWriter, this function is initialed by the user.

For StyleWriter II two purges are performed automatically when the cartridge is replaced. In the event that the cartridge does not print have the user check that the purge boot is correctly in place and the orange cartridge tape is removed from the print head. The user should purge the cartridge 5 times. If this does not cure the problem, it is likely the cartridge has been damaged. The damage is due to a film that develops when the heating element inside the print head heats up without ink.

The fix is to replace the cartridge. Always purge a new cartridge 5 times. StyleWriter II customers will get 2 automatic purges, so they will only need 3 additional. This will prevent repeat occurrences.
NOTE: Most StyleWriter II cartridges work fine after the 2 automatic purges.

A/UX 3.0.2: Software Handshaking With stty (12/93)

Revised: 12/17/93
Security: Everyone

A/UX 3.0.2: Software Handshaking With stty (12/93)

==========

Article Created: 16 December 1993

TOPIC -----

Under A/UX 3.0.2, when we try to set the /dev/tty0 to use software handshaking (Xon/Xoff) using 'stty', /dev/tty0 seems to accept but ignore whatever 'stty' setting we provide it with, any suggestion?

DISCUSSION -----

In A/UX, some of flow control tty settings such as 'modem', 'dtrflow', and so on are maintained across last close. This means the flow control settings are "remembered" when a tty device is closed and reopened again. However, other termio characteristics like software flow control (ixon, ixoff), speed (50, 75, 1200, and so on), parity (parenb, parodd, and so on), input modes (ignbrk, brkint, istrip, and so on), local modes (echo, echok, and so on) are set to the default settings when the tty line is closed. The default setting for software flow control on tty0 is off.

In order to make the 'stty' settings affected and still keep the tty port open put a sleep statement, 'sleep 99999' for example, after the 'stty' command. In your case, you may do:

```
(stty hupcl ixon ixoff; sleep 99999) < /dev/tty0 &
```

LaserWriter 810 & 360: Fax Option Error Checking (12/93)

Revised: 12/17/93
Security: Everyone

LaserWriter 810 & 360: Fax Option Error Checking (12/93)

==========

Article Created: 17 December 1993

TOPIC ----------

Do the fax options for the LaserWriter Pro 810 and LaserWriter Select 360 perform any error checking when transmitting and receiving data?

DISCUSSION ----------

Group 3 fax machines incorporate a means for identifying the optional features that are available on the receiving fax machine during the initial connection and identification phase. Better quality fax machines including the LaserWriter Pro 810 and LaserWriter Select 360 fax options support the ECM error correction method in both the group 3 and PostScript fax modes. ECM is a method for error correction where the facsimile data to be transmitted is divided into data units each having a certain length, so that when any error occurs during data transmissions the applicable data unit is resent. Both the sending and receiving fax machines must support ECM for the option to be enabled.

The Group 3 raster fax data is sent in packets with a CRC byte. If the CRC byte is bad then the receiving station will keep requesting retransmission of the packet until it is successfully received.

The above information applies to Group 3 fax jobs. All PostScript fax jobs transmitted to other PostScript fax printers will always use ECM error correction since a single error can prevent a PostScript job from printing.

AppleScript: Apple Event Manager Not Loading (1/95)

Revised: 1/12/95
Security: Everyone

AppleScript: Apple Event Manager Not Loading (1/95)

==========

Article Created: 17 December 1993
Article Reviewed/Updated: 12 January 1995

TOPIC -----

I have a Quadra 800 running System 7.1, Apple Event Manager 1.0.1 and AppleScript 1.0.

Occasionally, on startup, the Apple Event Manager has an red "X" through it, indicating that it's not loading. When this happens there seems to be extra disk activity (after a normal restart) preceding the red "X". Rebooting does not clear up the problem.

Using the Extension Manager (from Apple) to disable all but these two extensions does not clear it up. I have found that to clear this up, I must Zap PRAM and reboot twice! On the first reboot the Apple Event Manager does not load properly. I reset 32-bit addressing and cache size in the Memory Control Panel as well as other settings cleared by resetting the PRAM. On the next startup the Apple Event Manager initialized properly.

What conditions cause this extension not to load?

DISCUSSION -----

Engineering has released version 1.0.3 of the Apple Event Manager which corrects the problem described above. Please be sure to remove all other copies of the Apple Event Manager (note the space in front of the name - a customer might drag 1.0.3 into his Extensions folder, thinking it would replace the older version, but it wouldn't because of the filename difference).

Version 1.0.3 is also on AppleLink:

Software Sampler
Apple SW Updates
Macintosh
Supplemental Software

Please note that this problem goes away with AppleScript 1.1, because the functionality of the Apple Event Manager extension has been rolled into the AppleScript extension.

Travelrama: System Requirements (11/95)

==========

Article Created: 17 December 1993
Article Reviewed/Updated: 30 November 1995

TOPIC ----------

What are the system requirements of Travelrama?

DISCUSSION ----------

The Travelrama game has the following system requirements:

1) A Macintosh LC III computer or other color Macintosh with a 68030 or faster processor (68040 recommended), 4 megabytes of memory (5 megabytes recommended), and System 7.1 or later.

2) A Macintosh-compatible 13-inch or larger RGB monitor which displays at least 640 by 480 pixels and 256 colors.

3) A Macintosh-compatible CD-ROM drive (double-speed CD-ROM drive recommended).

4) 2000K minimum allocated memory (2300K preferred) to run the game.

Number of Colors

If your Macintosh computer is not set to 256 color mode, you will receive an error message. To set your Macintosh to display 256 colors, follow these steps:

1) Select Control Panel from the Apple Menu, then double-click on Monitors.

2) Select 256 and click on Color in the Monitor Control Panel, then close the control panel by clicking the close-box.

If your Macintosh does not support 256 colors, you must add VRAM or a video

board that supports 256 colors.

Number of Pixels

If your monitor does not display at least 640 by 480 pixels, you will receive an error message. You must attach such a monitor to your Macintosh to play Travelrama.

Memory

If you do not have enough memory available, your system may suddenly "crash" or stop operating. If this happens, follow these steps:

1) Go to the Finder and select About this Macintosh from the Apple Menu. The largest unused block must be at least 2000K.

2) If you do not have this much memory, remove extensions and/or control panels that are not needed to run Travelrama.

Note that using Virtual Memory will cause Travelrama to run irratically and is not recommended.

Wacky Jacks: Why Do I Lose Sound? (12/93)

Revised: 12/17/93
Security: Everyone

Wacky Jacks: Why Do I Lose Sound? (12/93)

==========

Article Created: 17 December 1993

TOPIC ----------

Why do I sometimes lose sound when I run Wacky Jacks?

DISCUSSION ----------

This is generally caused by a lack of application memory or by not having your computer's sound turned up. Here are some items to check:

1) Ensure that you have enough system memory available to run Wacky Jacks. If you do not, make more memory available by closing other applications or by adding memory to your computer.

2) Set your Minimum and Preferred memory size to 2300K. To do this, create a new folder on your hard drive and copy the Wacky Jacks application into that folder. Then, create aliases of all other Wacky Jacks folders and copy them into the new folder. Finally, click the Wacky Jacks icon, choose Get Info from the File Menu, then change the Minimum and Preferred memory size to 2300K.

3) Remove Sound Manager 3.0 and use the System 7.x sound resources instead. Sound Manager 3.0 offers superior sound quality, but uses slightly more memory.

4) Ensure that you have the volume turned up in your Sound Control Panel.

ARA MultiPort Server: Read Me File (12/93)

==========

Article Created: 16 December 1993

TOPIC -----

This article contains the Read Me file for the Apple Remote Access Multiport Server.

DISCUSSION -----

APPLE REMOTE ACCESS MULTIPORT SERVER READ ME

This document provides late-breaking news about the Apple Remote Access MultiPort Server not covered in the “Apple Remote Access MultiPort Server Administrator’s Guide.” You may need to refer to that guide to understand the use of several terms in this document.

Modems supported by the Apple Remote Access MultiPort Server

The Remote Access MultiPort Server supports any Hayes-compatible 9600-bps or higher-speed modem with the appropriate script. Modem scripts for many popular modems are provided on the Apple Remote Access MultiPort Server installation disks, including:

United States

V.fast modems:
- Motorola Codex 3260fast

V.32bis modems (14,400 bps):
- Hayes Ultra 144
- Motorola Codex 3260
- US Robotics Courier V.32bis

V.32 modems (9600 bps):
- Hayes Ultra 96

```
  Telebit T1600
  UDS/Motorola 3225
  UDS/Motorola 3227
  US Robotics Sportster
  US Robotics Worldport

ISDN support:
  Hayes ISDN Adapter

Germany
-------
25,000 bps:
  Motorola 326x (Fast) v2

19,200 bps:
  MDG 19K2-31 v2
  MDG14MX-22 v2

14,400 bps:
  euroScout v2
  PriCom 14.4  v2
  TELEJET 14400 v2

9600 bps:
  FURY 9600 TI v2
  MicroLink 9624 v2

2400 bps:
  CN-3532 SA Plus v2
  CN-3532 SA v2
  MicroLink 2410 v2

Switzerland
-----------
19,200 bps:
  ZyXEL U-1496

9600 bps:
  FURY 9600 TI v2
  NOKIA PMD 9600

NOTE:  The U.S. scripts listed above are also installed in all other
countries.

9600-bps or higher-speed modem scripts included with the Apple Remote Access
Client for Macintosh software can also be used with the Apple Remote Access
MultiPort Server.

If you're familiar with connection control languages (CCLs), you can also
write the appropriate script for your modem by using the “Apple Remote Access
Scripting Guide” and the Modem WorkShop software, which are included with the
Apple Remote Access MultiPort Server.
```

Using an MNP 10 modem

MNP 10 is an error-correction protocol that allows for more reliable data connections made through cellular modems.

Cellular phones with modems that have MNP 10 capabilities generally cannot receive a callback from a server due to variations in how phones answer incoming calls. Use a different security verification method than callback for cellular clients.

Using a Remote Access MultiPort Server with an Apple Internet Router

The Remote Access MultiPort Server may coexist on the same Macintosh with the Apple Internet Router version 3.0.1 or later. If Apple Internet Router 3.0 is installed, you must upgrade to Apple Internet Router 3.0.1 before installing the MultiPort Server. You may obtain this software through your authorized Apple reseller or representative, AppleLink, or the Apple Customer Assistance Center.

Using the Remote Access MultiPort Server with AppleShare

If AppleShare 4.0 is installed on the same Macintosh as the Apple Remote Access MultiPort Server is to be installed on, you must upgrade to 4.0.1 before installing the MultiPort Server. The Apple Remote Access MultiPort Server and AppleShare 4.0.1 can be active concurrently. You may obtain this software through your authorized Apple reseller or representative, AppleLink, or the Apple Customer Assistance Center.

Using the Remote Access MultiPort Server with Macintosh File Sharing

You cannot use the Remote Access MultiPort Server software concurrently with System 7 Macintosh file sharing. When you start the Remote Access Manager program, you will be asked to convert the Users & Groups Data File. After it is converted, only Remote Access Manager and AppleShare 3.0 (or later) can use the Users & Groups Data File.

Using the MultiPort Server on Macintosh computers with 7-inch NuBus Cards

Macintosh computers that use 7-inch NuBus™ cards only (such as the Macintosh Centris 610 and Macintosh Centris 660AV) may not be supported at this time by the Apple Remote Access MultiPort Server. Consult your authorized Apple reseller or representative for more information.

Using the Remote Access MultiPort Server with the built-in serial ports

The built-in serial ports in your Macintosh are not available for use with the Remote Access MultiPort Server.

Automatically starting the Remote Access MultiPort Server

If you want the MultiPort Server to start automatically after you restart your computer, or if you want the server to restart after a power failure, place the Remote Access Manager application (or an alias) in the Startup Items folder, located in the System Folder. The MultiPort Server will only start automatically if it was running the last time you quit the Remote Access Manager application.

Printing the Remote Access MultiPort Server Log

For best results when printing the Remote Access Manager server log, choose Page Setup from the File menu and then select the following options:

1. In the Orientation section of the dialog box, select the landscape page orientation (the option on the right).

2. In the Reduce or Enlarge box, type 70.

Using the Remote Access MultiPort Server with a security zone

If a security zone is advertised by a network router, make sure the security zone is available when Remote Access Manager ports are configured and turned on. Otherwise, when an Apple Remote Access user dials in, the user will be disconnected and the port turned off. See the “Apple Remote Access Security Zone Read Me” file (on the “Apple Remote Access MultiPort Server Toolkit” disk) for more information.

Zone lists and server performance

Overall performance of the MultiPort Server may be diminished if a large number of zones are included as part of a user’s zone access privileges. If you wish to allow or disallow a user’s access to a large number of zones, it would be better to choose either “All Zones except listed” or “Only Zones listed,” respectively. (See the section “Creating a New User” in Chapter 3 of the “Apple Remote Access MultiPort Administrator's Guide” for details on how to set these options.) Always try to minimize the number of zones in a user’s zone list for best performance.

Reinstalling the Remote Access MultiPort Server software

If you reinstall the MultiPort Server software and want to keep your server preferences and port configuration, move the MultiPort Server Preferences and Remote Access Preferences files out of your Preferences folder (in the System Folder) before reinstalling the MultiPort Server. After you reinstall the software, replace the newly installed MultiPort Server Preferences and Remote Access Preferences files with your original files.

NOTE: Only replace the MultiPort Server Preferences file with the original file if you know that your original file is not damaged. Your MultiPort Server will not start with a damaged MultiPort Server Preferences file.

NOTE:  The U.S. scripts listed above are also installed in all other
countries.

Modem scripts included with the Apple Remote Access MultiPort Server can also
be used with the Apple Remote Access Personal Server.

Using AppleTalk Remote Access v1.0 Modem Scripts with the ARA Personal Server
------------------------------------------------------------------------------
You can use AppleTalk Remote Access version 1.0 modem scripts with Apple
Remote Access Personal Server, but you will not be able to use certain new
features, such as Ignore Dial Tone, Manual Dialing, and MNP 10.  You cannot
use Apple Remote Access Personal Server modem scripts with AppleTalk Remote
Access version 1.0.
```

Calling an AppleTalk Remote Access version 1.0 Server

The AppleTalk Remote Access 1.0 Compatibility option allows you to call a version 1.0 server and to receive callbacks from a 1.0 server (see Chapter 3 of the “Apple Remote Access Personal Server for Macintosh User's Guide” for details on setting this option). However, it does NOT allow an Apple Remote Access Personal Server to receive calls from an AppleTalk Remote Access 1.0 client. The Apple Remote Access Personal Server can only receive calls from version 2.0 Apple Remote Access Clients.

Using an MNP 10 modem

MNP 10 is an error-correction protocol that allows for more reliable data connections made through cellular modems.

To establish an MNP 10 connection, your modem and the modem you're calling must support MNP 10; clicking the “Use MNP 10 error correction in modem” checkbox in the Remote Access Setup window is not by itself sufficient to establish an MNP 10 connection.

Using aliases with Apple Remote Access

When you create an alias over an Apple Remote Access connection, select the alias icon and choose Get Info from the File menu, then click the Locked checkbox. If you don't lock the alias, the alias can be converted to call the wrong Apple Remote Access server or to try to access the service across your local network.

Using the Manual Dialing feature

When you use Manual Dialing, establishing a Remote Access connection varies according to the type of modem you are using. To ensure that you can make a connection while using Manual Dialing, you may need to experiment with pressing the Connect button slightly before or after you hear the remote modem answer the phone.

Using the Redialing feature

Remote Access Client will attempt redialing only when the phone number that has been dialed is busy. If the connection attempt has failed for any other reason, Remote Access will stop the redialing attempts so that you can correct any problems.

When using the Redialing option, you should set the “Time between retries” number to five seconds or greater. Depending on the modem, anything less than five seconds may not give your modem sufficient time to reset, resulting in your Macintosh serial port being busy and unavailable for redialing.

When using the Redial alternate number option, the main number will be dialed once before the redialing sequence is initiated. The redialing sequence will then alternate between the main and alternate numbers.

Using DialAssist

In certain countries city/area codes don't exist. If you are calling within such a country and you encounter problems, try entering a space in the "Connect To City/Area Code" field in your connection document to get DialAssist to work properly.

Serial Port Arbitration

When a Remote Access connection is established (or being established when answering or making a call), Remote Access prevents other application programs from using the serial port you selected in the Remote Access Setup control panel. In this case, most programs will inform you that the port is in use.

If your Macintosh is set up to answer calls (the “Answer calls” checkbox in the Remote Access Setup control panel is selected), then other programs are allowed to use the serial port. When they are finished with the port, Remote Access reenables your Macintosh to answer calls.

Remote Access Personal Server provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect this, remove the Serial Port Arbitrator file from the Extensions folder, restart your Macintosh, and try the program again.

NOTE: The Serial Port Arbitrator will not work on a Macintosh if Remote Access Personal Server has not been installed.

Macintosh computers with Virtual Memory

If you are using a Macintosh IIfx, Macintosh Quadra 900, or Macintosh Quadra 950 and have Virtual Memory turned on, you must open the Serial Switch control panel (included on the Install 2 disk) and set the serial port setting to Compatible.

Modem cable requirements

Most modems require a cable that supports the data terminal ready (DTR) signal. In addition, certain modems require a cable that supports CTS/RTS hardware flow control. To support DTR, the cable must connect pin 20 on the DB=25 connector to pin 1 on the Mini DIN=8. To support CTS/RTS, the cable must connect pin 5 on the DB=25 connector to pin 2 on the Mini DIN=8 and pin 4 on the DB=25 connector to pin 1 on the Mini DIN=8. See your modem vendor or Apple=authorized dealer about obtaining the necessary cable.

  NOKIA PMD 9600

NOTE:  The U.S. scripts listed above are also installed in all other
countries.

Modem scripts included with the Apple Remote Access MultiPort Server can also
be used with the Apple Remote Access Client for Macintosh.

Using AppleTalk Remote Access v1.0 modem scripts w/Apple Remote Access Client
------------------------------------------------------------------------------
You can use AppleTalk Remote Access version 1.0 modem scripts with Apple
Remote Access Client, but you will not be able to use certain new features,
such as Ignore Dial Tone, Manual Dialing, and MNP 10.  You cannot use Apple
Remote Access Client modem scripts with AppleTalk Remote Access version 1.0.

Using an MNP 10 modem
---------------------
```

MNP 10 is an error-correction protocol that allows for more reliable data connections made through cellular modems.

To establish an MNP 10 connection, your modem and the modem you're calling must support MNP 10; clicking the “Use MNP 10 error correction in modem” checkbox in the Remote Access Setup window is not by itself sufficient to establish an MNP 10 connection.

Using aliases with Apple Remote Access

When you create an alias over an Apple Remote Access connection, select the alias icon and choose Get Info from the File menu, then click the Locked checkbox. If you don't lock the alias, the alias can be converted to call the wrong Apple Remote Access server or to try to access the service across your local network.

Using the Manual Dialing feature

When you use Manual Dialing, establishing a Remote Access connection varies according to the type of modem you are using. To ensure that you can make a connection while using Manual Dialing, you may need to experiment with pressing the Connect button slightly before or after you hear the remote modem answer the phone.

Using the Redialing feature

Remote Access Client will attempt redialing only when the phone number that has been dialed is busy. If the connection attempt has failed for any other reason, Remote Access will stop the redialing attempts so that you can correct any problems.

When using the Redialing option, you should set the “Time between retries” number to five seconds or greater. Depending on the modem, anything less than five seconds may not give your modem sufficient time to reset, resulting in your Macintosh serial port being busy and unavailable for redialing.

When using the Redial alternate number option, the main number will be dialed once before the redialing sequence is initiated. The redialing sequence will then alternate between the main and alternate numbers.

Using DialAssist

In certain countries city/area codes don't exist. If you are calling within such a country and you encounter problems, try entering a space in the "Connect To City/Area Code" field in your connection document to get DialAssist to work properly.

Serial Port Arbitration

When a Remote Access connection is established (or being established when making a call), Remote Access prevents other application programs from using the serial port you selected in the Remote Access Setup control panel. In this case, most programs will inform you that the port is in use.

Remote Access Client provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect this, remove the Serial Port Arbitrator file from the Extensions folder, restart your Macintosh, and try the program again.

NOTE: The Serial Port Arbitrator will not work on a Macintosh if Remote Access Client has not been installed.

Macintosh computers with Virtual Memory

If you are using a Macintosh IIfx, Macintosh Quadra 900, or Macintosh Quadra 950 and have Virtual Memory turned on, you must open the Serial Switch control panel (included on the Install 2 disk) and set the serial port setting to Compatible.

Modem cable requirements

Most modems require a cable that supports the data terminal ready (DTR) signal. In addition, certain modems require a cable that supports CTS/RTS hardware flow control. To support DTR, the cable must connect pin 20 on the DB=25 connector to pin 1 on the Mini DIN=8. To support CTS/RTS, the cable must connect pin 5 on the DB=25 connector to pin 2 on the Mini DIN=8 and pin 4 on the DB=25 connector to pin 1 on the Mini DIN=8. See your modem vendor or Apple=authorized dealer about obtaining the necessary cable.

ABS Tech Note: AWS15 Reconfig of bnet For ATalk Support (1/94)

Revised: 1/11/94
Security: Everyone

ABS Tech Note: AWS15 Reconfig of bnet For ATalk Support (1/94)

==========

Article Created: 23 December 1993

TOPIC ----------

This technical note describes the proper reconfiguration of bnet for AppleTalk support on an Apple Workgroup Server (AWS) 95.

DISCUSSION ----------

Network protocols, like TCP/IP and AppleTalk, must be configured into the A/UX kernel before they can be used. To add networking capability through the Ethernet port, you must add a low-level driver to the kernel along with TCP/IP and AppleTalk Support This can be done by typing the following command in a CommandShell window,

```
newconfig bnet appletalk
```

This will create a new kernel that will include the necessary modules for Ethernet (ao, as or ae6), TCP/IP and AppleTalk support. It is important to note that the appletalk kernel module has certain dependencies on the bnet module and therefore both modules must be included in the kernel if support for AppleTalk is desired.

The user may decide to reconfigure the kernel that does not include the AppleTalk, TCP/IP and NFS modules. This can be done by typing the following command in a CommandShell window,

```
newconfig nonet
```

If the user decides later on to add support for AppleTalk, newconfig appletalk is not sufficient to configure the A/UX kernel. As mentioned before, the appletalk kernel module has certain dependencies on the bnet module, this makes it necessary to configure the kernel to include bnet. If the you attempt to build a kernel with appletalk support without the bnet module being included, the newconfig command will report an error. For example:

```
auxtest.root 9 # newconfig appletalk
newconfig: Making backup copies of /etc/inittab /etc/passwd /etc/group.
newconfig: Preparing to build a new kernel.
newconfig: Building a new kernel (this may take several minutes).
newconfig: *** PROBLEMS BUILDING A NEW KERNEL. ***
newconfig: You might try running newconfig with the -v flag.
/tmp/ncErr11168:Autoconfig error: Kernel link failed
Driver startup files in /etc/startup.d may not match kernel!
Run newunix(1m) to restore previous configuration
newconfig: Restoring saved /etc/inittab /etc/passwd /etc/group.
```

Running the newconfig command with the -v option, reveals that the kernel could not be linked because of undefined symbols in the elap module. These symbols are part of the bnet module.

```
ld warning: file /tmp/kernAAAa01368 has no relocation information
undefined first referenced
symbol in file
probing /etc/boot.d/elap
ld fatal: Symbol referencing errors. No output written to
/tmp/kernBAAa01368 Autoconfig error:
Kernel link failed
```

The correct way to include AppleTalk support back in the kernel after removing all network support is to include both the appletalk and bnet modules. This can be done by typing the following command in a CommandShell window:

```
newconfig bnet appletalk
```

On the other hand, creating a kernel which just includes the bnet module does not provide support for AppleTalk.

If you go to the Chooser and try to set AppleTalk to active, it will present you with the following dialog,

```
Please make sure that you are connected to an AppleTalk network
```

Followed by:

```
AppleTalk cannot be opened
```

If you go into the Network Control Panel and try to select EtherTalk, the following dialog will be displayed,

```
Please be sure you are connected to an AppleTalk network
```

If you click the OK button, the dialog will appear again. At this point, the only option available to exit the Macintosh Environment is to use Ctrl-Command-E.

To correct this situation, a new kernel that includes both the bnet and

appletalk modules should be created. This can be done by typing the following command in a CommandShell window,

```
newconfig bnet appletalk
```

NOTE: To make use of the new kernel, you must reboot the system each time following the newconfig command. For more information on the newconfig details, refer to the on-line man page for newconfig.

ABS Tech Note: AWS16 File Access Control on the AWS 95 (1/94)

Revised: 1/11/94
Security: Everyone

ABS Tech Note: AWS16 File Access Control on the AWS 95 (1/94)

==========

Article Created: 23 December 1993

TOPIC

The purpose of this tech note is to differentiate Macintosh (AppleShare) file privileges and A/UX file permissions. This document will discuss the concepts involved with each form of file access control and also discuss how the two concepts were integrated with each other on the Apple Workgroup Server (AWS) 95.

DISCUSSION

AppleShare (Macintosh) File Access Privileges

The Macintosh was originally designed as a single-user machine, where all the files on the machine were only accessible by one user. As a result there is no support for file access control built into the file system. With the advent of AppleShare it was necessary to come up with a scheme to control access to files which were shared on a network. On a Macintosh which runs as an AppleShare file server there exists a special file which stores all the necessary information to determines the accessibility of files to network users (See the AppleShare Pro Server 1.0 Administrator's Guide for a detailed description of AppleShare file privileges).

A/UX File Permissions

UNIX was originally designed as a multi-user operating system, thus a file access control mechanism was designed into the file system from the start. On each UNIX system there is a list of users which can log on to the system, each user has a unique name and user ID. In order to provide more control and flexibility when setting up file accessibility UNIX also maintains a list of groups, each group has a unique name and group ID. A group is defined by a list of 0 or more users. Each user must be a member of at least one group, known as the user's primary group, but may also be a member of any of the other group.

For each file in a UNIX file system, in addition to the data content of the UNIX file there is also information stored which determines file access. Each UNIX file has associated with it the following data: An owner (usually the user which created the file); a group (usually the primary group of the user which created the file); and a set of 9 permission bits.

The 9 permission bits associated with a file can be broken down in 3 parts, leaving 3 bits for each part. Each set of 3 bits defines the level of access for the file depending on which user is accessing the file. The first 3 bits (reading from left to right) determines the level of accessibility for the owner of the file. The second 3 bits apply to users who are a member of the group which is assigned to the file. The third 3 bits apply to any user who does not fall in either of the first two categories. These 3 user types are termed "User, Group and Other", respectively.

Now for the interpretation of the 3 bits. The first bit (read from left to right) determines whether the user has read access on the file. The second bit determines if the user has write access on the file. The third bit determines if the user has execute permission on the file.

Read and write access on a file is pretty much self-explanatory, if a user has read permission on a file then they may read the contents of the file, if a user has write permission on a file then they may modify the contents of a file. Execute permission determines if a user can execute a file, in the case where the file is an executable program. In the case where the file in question is a directory the execute bit determines if a user may make the directory their current working directory ("cd" into it).

Integration of both File Access System on the AWS 95

On an Apple Workgroup Server 95, somehow both file access systems apply to some of the files and how this is done can sometimes be confusing. There exists 2 separate list of users and each file has it's UNIX permissions as well as it's AppleShare permissions. In order to explain how this integration is achieved the concept of the "Super User" or "root" must be understood. On every UNIX machine there exists a special user, "root", to which file access control does not apply. In effect the "root" user has read, write and execute permission on every file in the file system.

On the AWS 95 the AppleShare program (the program which provides file sharing service to network users) runs as a "root" process. That is, all file accesses made by the AppleShare process are made from the "root:" user, which means that the AppleShare process has unrestricted access to all UNIX files. This provides AppleShare users with the illusion that an AppleShare volume on an AWS 95 is the same as a volume on a regular Macintosh.

This integration can often confuse administrators and users since one would expect a file to be owned by the AppleShare user, but if we go look at it from the UNIX side it is owned by the "root" user.

ABS Tech Note: AWS17 .fs_cache Item Limits (6/94)

Revised: 6/24/94
Security: Everyone

ABS Tech Note: AWS17 .fs_cache Item Limits (6/94)

==========

Article Created: 23 June 1994

TOPIC ----------

This article describes the item limit recommendation on the Apple Workgroup Server (AWS) 95.

DISCUSSION ----------

Apple is recommending for releases prior to A/UX 3.1 a 120,000 item limit for items that can be shared on a AWS95. The limit is due to incorrect handling in the b-tree code that maintains the .fs_cache file. The .fs_cache file is used to create b-tree entries for all items being shared under AppleShare Pro. The problem occurs when the .fs_cache file becomes greater than 32 megabytes in size. The maximum number of items can be calculated with the following formula:

32,000,000 / 200 bytes for each item = 160,000 Items

The number of 120,000 that is being recommended as opposed to 160,000 is conservative and is meant to avoid any problems from occurring until a version of the AWS95 software is released that eliminates this problem. The 120,000 number will also allow for some growth up to the maximum of 160,000.

Installing ORACLE7 Server (Version 7.0.12.2.0) For A/UX (10/93)

==========

Article Created: 28 October 1993

TOPIC ----------

This technical information was provided by Oracle. This document was not written by Apple or tested for accuracy, but it's included because we feel you might find it useful.

DISCUSSION ----------

Installing ORACLE7 Server for A/UX (Version 7.0.12.2.0) Desktop
Victor Grigorieff
October 13, 1993 Apple A/UX 3.0.1

Updated 10/28/93 by Victor Grigorieff

This bulletin describes the steps required to install ORACLE7 Server for A/UX. This document assumes that A/UX has been properly configured. Bulletin #103947.028 describes in detail how to install A/UX 3.0.1 properly.

This bulletin only applies to the 7.0.12.2.0 Server release, as this process will most likely change with the upcoming 7.0.15 release.

Related Bulletins:

#103947.028 - Setting up an AWS 95 Server for Oracle7 for A/UX
If any part of the pre-installation checklist is not clear, or does not work, refer to this bulletin for assistance.

#104011.574 - Tips for administrating and supporting ORACLE7 for A/UX
This bulletin describes the techniques and tricks used to setup and debug the UNIX and Oracle installations.

Pre-Installation Checklist

C Compiler — You must install the C compiler for the install of Oracle to complete. If you type the command 'which cc' at a UNIX prompt, you should see '/bin/cc'. If you do not see this, you must reinstall A/UX to install the C compiler.

Disk Space — You must have 60 megabytes of space available to install the ORACLE7 Server for A/UX with the sample database. You can use the command 'df -B' to determine the amount of available space on the currently mounted filesystems. I recommend installing the Oracledatabase files on a separate filesystem from '/', which contains the operating system.

TCP/IP — If you intend to use SQL*Net TCP/IP, check the configuration of the networking software. Type the command 'hostname' to determine the name of your host, and then try to telnet to that host. See Bulletin #104011.574 for more details on this.

AppleTalk — If you intend to use AppleTalk check to see that the server is connected properly to your network. Usually, the Workgroup Server 95 is connected to an Ethernet network. If you are on an Ethernet network, check to see that the Network Control Panel has EtherTalk selected. Then, check the Chooser to se if you can see other AppleTalk devices on the network such as AppleShare file servers or LaserWriter printers.

Also, type the command:

```
ls -l /usr/lib/libat.a
```

If you do not see something like the following line, then you need to reinstall A/UX, including the Network Server capability:

```
-rw-r--r--  1 bin  bin   35774 Mar 23  1993  /usr/lib/libat.a
```

Installation

Before installing Oracle7 Server for A/UX, log into the AWS 95 as the root user. You must be root if you want to be able to install any SQL*Net product.

To install ORACLE7 Server for A/UX, you run the "AUX Installer" program from the folder called "Aux Installer" which is on the CD. The Installer will ask you several questions along the way.

Destination — You need to pick a folder to install the Oracle database and utilities. This will later be known as the ORACLE_HOME, which you will need to know.

*** Important: You may not install the Oracle database in any
*** directory whose path has a space in its name. This
*** means that you may not install in the '/ Shared Data'
*** directory.

Oracle owner — This is the user who will own the Oracle installation. You may pick an existing user, or let the Installer create a new user for you. The default is to let the Installer create a new user named 'oracle', which is fine.

DBA group — This is the name of the group that will have the ability to start and stop the database, and perform DBA-privileged operations. The Installer will create a new group for you if the group does not already exist. The default is to let the Installer create a new group called 'dba'.

Software — The ORACLE7 Server for A/UX is made up of several components.

A/UX RDBMS and Utilities
A/UX Required Support Files Version 7.0
A/UX SQL*Net Version 1.0

I recommend installing all of the options with this 7.0.12.2.0 release. If you know you will never need either SQL*Net AppleTalk or TCP/IP, you may choose to leave one of them out, but you would not be saving a large amount of disk space.

Procedural Option — The Installer WILL NOT ask you if you are licensed to use the Procedural Option. If you are in fact licensed for this option, you may enable it by running the script called CATPROC.SQL after installing and creating the database. This process is described in the Oracle7 Server Administrator's Guide.

Distributed Option — You will be asked if you are licensed to use the Distributed Option. If you are licensed, you may click yes.

If you click yes, several features will be enabled. these include the ability to maintain snapshots and snapshot logs (remote views of databases).

Note: The Distributed functionality will not work unless the Procedural Option is enabled.

Seed Database — You will be asked if you would like to create the seed database in the folder where you are installing oracle.

There are good reasons to choose Yes or No, which are below:

Yes — If you click yes, the Installer will start sqldba (the Oracle database administration program), and run the script createdb.sql, which was installed in the dbs directory of the oracle home. The sample database will be named SAMP.

This is a quick way of having a working database that you can use for learning and testing. The creation of this database requires one click of the mouse.

You will be warned that creating the database will destroy any other datbases in this location. If this is the first time you have installed an Oracle database in that directory, do not worry about this warning.

If you already have a database named SAMP in that directory, choosing Yes will overwrite your old database by creating a new one.

No — You may choose not to create the seed database, because you want to name the database something other than SAMP, or want to use different parameters and sizes for your database.

You could manually create the database, following the instructions in chapter 2 of the "ORACLE7 Server Administrator's Guide". This is somewhat difficult if you have never done it before.

Alternatively, you could make a copy of the createdb.sql script, and edit that copy. If I have an edited copy of createdb.sql called custom_createdb.sql, I could run that in sqldba to build my database.

Once you have answered all of the questions, the Installer will install the options you have selected, and create a seed database if you requested that.

Post Installation Tasks

Once the installation is complete, you will need to go through a few more steps to properly configure the Oracle database.

SQL*Net — There are several files which need to be created/edited to configure SQL*Net Version 1.

/etc/oratab — You need to create a file called oratab in the /etc directory. This file lists the instances (SID's) available on the A/UX machine. This file is required by both the TCP/IP and AppleTalk protocols of SQL*Net. This file has one line per database on the machine. Lines beginning with '#' are comments which are ignored. Each line is made up of the format:

```
                SID:ORACLE_HOME:STARTUP

                Where:  SID is the name of the database
                        ORACLE_HOME is where you installed the database
                        STARTUP is either Y or N, which indicates
                                whether the dbstart and dbshut
                                utilities should start or stop that
                                database.

                The default /etc/oratab should have the line:

                SAMP:/users/oracle:N

TCP/IP      If you intend to use SQL*Net TCP/IP version 1, you must edit
            several files, and startup the TCP/IP listener.

      /etc/services   You need to define a port number for SQL*Net
                      TCP/IP Version 1.   By default, this is 1525.  If
                      you use a different number for the orasrv port
                      number, you must configure the client machines to
                      use that same number.  In most cases, you will be
                      fine if you add the following line:

                      orasrv  1525/tcp  oracle  # SQL*Net Version 1

      /etc/hosts      This file lists all the IP addresses and host
                      names for all machines that the A/UX server can
                      connect to using TCP/IP. If your own host is not
                      already listed in the file, add an entry with the
                      format

                      <IP address>  <hostname> <aliasname>

                      An example would be:

                      139.185.81.95 squid.us.oracle.com squid

                      You may optionally list several other aliasnames
                      for each host, allowing you to call a host by
                      several different names.

      tcpctl start    This command starts the TCP/IP listener by running
                      the orasrv program.

                      This will start the orasrv process, which will
                      listen for client connections on the port defined
                      in the /etc/services file.

                      Client machines would then be able to connect
                      using the database connect string:

                        t:hostname:SAMP
```

hostname is the name of the server on the TCP/IP network. SAMP is the name of the database.

AppleTalk

If you wish to use SQL*Net AppleTalk version 1, you must start the atksrv process. As the root user, type:

```
atksrv MyServer
```

This will start up an AppleTalk server named "MyServer". Client machines will connect using the database connect string:

```
at:MyServer:SAMP [,Appletalk_Zone]
```

You would only need to specify the AppleTalk Zone if the client machine is in a different zone than the server.

Starting the atksrv process in this fashion will tie up that window until you stop the listener by hitting control-C.

You may run the atksrv process in the background by adding the ampersand (&) character after the command. You could then kill that process with the command "kill %", provided the atksrv process was the only background process of that window. Please see Bulletin 104011.57 for more information on running the atksrv process in the background.

Oracle user

If the A/UX Installer created the oracle user, there will be no .login file in the oracle user's home directory. If this is the case, log in as the oracle user, and issue the command:

```
cp /usr/lib/skel/std.login ~/.login
```

You will need to edit the .login file which is in the oracle user's home directory (by default /users/oracle). Add the following lines to the end of the file:

```
setenv ORACLE_HOME /users/oracle
setenv ORACLE_SID  SAMP
setenv PATH      "/users/oracle/bin:/bin:/usr/bin:/usr/ucb:
                  /mac/bin:/etc:/usr/etc:/usr/local/bin"
```

The examples above assume that Oracle was installed in /users/oracle and that the name of the SID is SAMP. If you have a different oracle home or a different name of the SID, you will need to use different values in the examples above.

*** Once you have edited the oracle user's .login file, you must
*** log out, and log in again as oracle before the changes will
*** take effect.

```
Post-Installation Checklist
---------------------------

Verify that database is running by using the ps command as shown here:

    ps -ef | grep dbwr
    root   10355 10242  2 07:39:46 pb       0:00 grep dbwr
    oracle  4196     1  0  Sep  2  ?        0:02 ora_dbwr_SAMP

    Look at the right-most column in this output.  If you see the process
    named "ora_dbwr_SAMP", then the SAMP database is running.

Verify that the TCP/IP listener process is running by using the command

     tcpctl status
     tcputl: Status summary follows
     Server is running:
       Started             : 21-SEP-93 10:01:29
       Last connection     : 30-SEP-93 14:39:49
       Total connections   : 300
       Total rejections    : 6
       Active subprocesses : 3
       ORACLE SIDs         : S7F,SAMP
       Default SID         : (null)
     Logging mode is ENABLED.
     DBA logins are DISABLED.
     OPS$ logins are ENABLED.
     OPS$ROOT logins are DISABLED.
     Orasrv is detached from the terminal.
     Break mode = IN BAND.
     Debug level = 1
     No timeout (on orasrv handshaking).
     Length of listen queue = 10
     Orasrv logfile = /u2/7012f/tcp/log/orasrv.log
     Orasrv mapfile = /etc/oratab

In the above example you see the string "Server is running", which is the
sign that TCP/IP is up and running.

Verify that the AppleTalk listener is running by using the command:

   ps -ef | grep atksrv
   root 22675 22662  0 14:57:02 q2       0:00 atksrv Squid
   root 22676 22662  1 14:57:28 q2       0:00 grep atksrv

Look at the right-most column in this output.  If you see the process
called "atksrv Servername", then the AppleTalk listener is running.

Verify that you can connect to the database using sqldba.

   sqldba
```

```
SQL*DBA: Release 7.0.12.2.0 - Production on Thu Sep 30 15:00:11 1993

Copyright (c) Oracle Corporation 1979, 1993.  All rights reserved.

ORACLE7 Server Release 7.0.12.2.0 - Production
With the procedural and distributed options
PL/SQL Release 2.0.14.0.1 - Production

SQLDBA> connect scott/tiger
Connected.
```

In this output, I connected as scott/tiger, and was successful. At this point you know that the database is running, and is accepting connections.

If you are still having problems with debugging/verifying the installation, refer to bulletin 104011.574 - Tips for administrating and supporting ORACLE7 for A/UX.

Ethernet NB Twisted-Pair Card: Supported on A/UX (8/95)

Revised: 8/23/95
Security: Everyone

Ethernet NB Twisted-Pair Card: Supported on A/UX (8/95)

==========

Article Created: 20 December 1993
Article Reviewed/Updated: 23 August 1995

TOPIC ----------

I have a Macintosh IIfx with A/UX 3.0, and I just bought the Ethernet NB Twisted-Pair Card. I ran the installer for the MacPartition and the card works fine under Mac OS. A/UX however, does not recognize it. I've done newconfig bnet and newconfig appletalk, taken them both down and reconfigured them, explicitly specified "ae0" (and, just in case "as0") drivers, but to no avail.

Is this card supported by A/UX?

DISCUSSION ----------

You should upgrade to A/UX version 3.1 or later for Ethernet NB Twisted-Pair Card support. The following information is from the Read Me for the Apple Workgroup Server (AWS) 95 Software Upgrade:

Install Driver for the Apple Ethernet NB Twisted-Pair Card

If you are using this new interface card, install the driver on the volume named MacPartition. Installing the file on MacPartition assures that the server will use EtherTalk rather than switching to LocalTalk each time you restart the server.

CORRECTIONS TO MANUAL PAGES
==========

A few commands are incorrect as they appear on screen in the manual pages. The corrections are as follows.

"newconfig" manual page

If you're adding support to your system for an Ethernet card, these are the

modules you need to specify in the "newconfig" command:

ao - Built-in interface for Apple Ethernet.
as - Apple Ethernet NB Card (a half-length card).
ae6 - Apple EtherTalk NB Card (a full-length card).
ac - Apple Ethernet NB Twisted-Pair Card.

An error appears in the last paragraph of the Descriptions section: "bnet_dr" should be "bnet".

"NETADDRS" manual page

The value of interface_id is as follows:
ao0 - for built-in interface for Apple Ethernet (which is found in the AWS 95)
ae0 through ae5 - for Apple EtherTalk NB Cards
as0 through as5 - for Apple Ethernet NB Cards
ac0 through ac5 - for Apple Ethernet NB Twisted Pair Cards

Article Change History:
23 Aug 1995 - Updated info to A/UX 3.1 and changed back to MacPartition.
06 May 1994 - Updated to reword "Mac Partition" to Macintosh partition.

Administrating and Supporting ORACLE7 For A/UX - Part 1 (10/93)

Revised: 12/21/93
Security: Everyone

Administrating and Supporting ORACLE7 For A/UX - Part 1 (10/93)

==========

Article Created: 28 October 1993

TOPIC ----------

This technical information was provided by Oracle. This document was not written by Apple or tested for accuracy, but it's included because we feel you might find it useful.

This is part 1 of 2, of an Oracle technical note on Administrating and Supporting ORACLE7 for A/UX. To find part 2 or 2, search for an article titled, "Administrating and Supporting ORACLE7 For A/UX - Part 2 (10/93)."

DISCUSSION ----------

Tips For Administrating and Supporting ORACLE7 For A/UX Desktop
Victor Grigorieff
September 29, 1993 Apple A/UX 3.0.1

Revised: 10/28/93 by Victor Grigorieff

This bulletin explains many of the tools and procedures used in setting up, administrating, and supporting ORACLE7 on A/UX 3.0.1. It is helpful to gather the pieces of information mentioned in this bulletin before trying other methods of diagnosing problems.

This bulletin describes several UNIX commands, but does not provide complete definitions of them. Please refer to the documentation from Apple Computer Inc., or the manual pages on-line for complete definitions of the commands described below.

Manual pages is an option which can be chosen at the time you install the A/UX operating system. If they are installed, you can access the information with the command called man.

Type 'man man' for a description of the man command.

Note: For clarity, some commands are enclosed in single quotes (') with the arguments they accept.

The commands and configuration files of importance are listed below, and are grouped by the type of task to which they are related.

Macintosh Environment & A/UX Management

If you are logged into the console of A/UX 3.0.1 in the Macintosh Finder environment, you there are several things which you need to know.

Command-Control-E	If the Macintosh ever appears to freeze (You cannot type or move the mouse), DO NOT RESTART THE MACHINE. You can kill the Macintosh session by holding down Command-Control-E. The Command key is the key which looks like an Apple or a clover. Doing this will return you to the A/UX logon screen, but will not affect any other UNIX processes on the machine, like the Oracle database.
General Controls	Under the Apple menu, there is an option for Control Panels. In the Control Panels folder is a General Controls Control Panel, which will let you set the date and time on the A/UX machine.
TextEditor	If you need to edit a text file, and prefer the Macintosh interface, you can look in /: Applications for the program called TextEditor. It works like any other word processor on the Macintosh.
/etc/RELEASE_ID	This text file tells you the version of A/UX you are running. A/UX 3.0.1 is required for ORACLE7 Server for A/UX. Type the command 'cat /etc/RELEASE_ID' to list the file: at /etc/hosts ********** * A/UX 3.0.1 * * Friday, April 9, 1993 * **********

User Management
---

id displays user and group IDs and names
If you are logged in as the oracle user, you will get output like this:

% id

```
              uid=1000(oracle) gid=1000(dba)

              This means that you are the oracle user, and your active group
              is dba.  By default, the oracle user and dba group own the
              oracle database installation, meaning that this user can
              perform privileged operations. You must have dba privileges to
              connect internal, and to startup or shutdown a database.

passwd        passwd is the command to change the password for a user
              account.  If I am logged in as oracle, and type 'passwd
              oracle', I will be asked for the current password (if there is
              one), and will then be allowed to enter a new password.

              By default the oracle and root users have no password, so it is
              important to set passwords for those users.

su            su is the command to become another user.

              su - oracle

              This command prompts you for a password, and then logs you in
              as the oracle user, while reading in the oracle user's
              environment.  If you leave out the '-' between the su command
              and the user, you will not read in that user's environment
              properly.  If you are logged in as some other user, and wish
              to logon as the oracle user, use the above command.

              You usually become the oracle user when you want to start/stop
              the database, and perform routine maintenance.

Network Management
------------------

hostname -    displays the name of the UNIX host.  This is helpful in
              figuring out how to assemble a sql*net connect string for
              TCP/IP.

              % hostname
              squid

              In this case, my hostname is 'squid'.

ping          ping is a command which sends simple TCP/IP packets to a host
              to determine whether or not the host is functioning on the
              network.  If you are having trouble connecting to a host with
              telnet or SQL*Net TCP/IP (ORA-6108 errors), then you should
              check to see if ping can reach the host.

              ** Ping is used to check how the host is responding to TCP/IP
              ** packets, which are completely different than AppleTalk
              ** packets.  If a client Macintosh can access the server using
              ** File Sharing, then that means that the network is physically
              ** intact.  It DOES NOT tell you that TCP/IP is functioning
```

```
** properly.  You should use ping to verify the TCP/IP setup.

ping can be run by typing '/usr/etc/ping some_host' where
some_host is the name (or IP address) of a machine on the
network.  See the description of the /etc/hosts file below for
more info.

/usr/etc/ping squid
PING squid.us.oracle.com: 56 data bytes
64 bytes from 139.185.81.95: icmp_seq=0. time=0. ms
64 bytes from 139.185.81.95: icmp_seq=1. time=0. ms
----squid.us.oracle.com PING Statistics----
2 packets transmitted, 2 packets received, 0% packet loss
round-trip (ms)  min/avg/max = 0/0/0

Since squid has been properly configured for TCP/IP and is
running, TCP/IP packets travel to it and back with no problem.
The ping command will keep sending packets until you hit
control-C,  at which point it gives you the PING Statistics.

If I attempt to ping a machine which is down,  the ping command
will keep sending packets until the host responds (which may
never happen) or until you hit Control-C.  If you do not see
any lines like '64 bytes from...' after 10 seconds, hit
control-C, and you will have output which looks like:

/usr/etc/ping bartman
PING bartman.us.oracle.com: 56 data bytes

----bartman.us.oracle.com PING Statistics----
12 packets transmitted, 0 packets received, 100% packet loss

In this case, bartman (a UNIX machine) has been turned off, and
hence does not respond to the ping command.  The 100% packet
loss means that the host you are attempting to ping is not
working, or is actually at a different address than the one you
are trying.

If I am trying to make a database connection to bartman using a
database connect string like 'T:bartman:SAMP', I would get the
ORA-6108 error, indicating that the TCP/IP connection attempt
failed.  I could then use the ping command to find out if the
machine named bartman is functioning on the network.  If
bartman does not respond to a ping, action should be taken to
revive bartman.  In this case, I would go and turn the machine
on.

If bartman does respond to a ping, but not a SQL*Net TCP/IP
connection attempt, then there could be several different
things going on.

 * The SQL*Net TCP/IP version 1 listener process (orasrv) may
   not be running.  Check to see if orasrv is active on the
```

machine, and if the /etc/services file has the correct entry for orasrv.

* Turn off the server and attempt to ping the server. This may sound like a silly thing to do, but if you ping a machine that is turned off and it actually responds, you know that there is another machine using the same IP address. If this happens, you need to talk to your network administrator to determine a new unique address for your server.

telnet

telnet is a way to log into another machine on the network using TCP/IP. It is a useful debugging tool as well as a convenience.

```
telnet squid
Trying...
Connected to squid.us.oracle.com.
Escape character is '^]'.

Apple Computer A/UX (squid)

login:
```

Once you see the login prompt, type the UNIX userid you wish to use and hit return. You will then be asked for a password. Once you have successfully entered the password, you will be working with the remote machine you have logged into, until you type exit.

ftp

ftp is a command you can use to transfer files from one machine to another. If you are transferring anything other than a text file, remember to type the command 'binary' at the 'ftp> prompt.

/etc/hosts

This file lists all the IP addresses and host names for all machines that the A/UX server can connect to using TCP/IP.

```
127.0.0.1     loop local me localhost
139.185.81.95 squid.us.oracle.com squid
```

In this file is the default 127.0.0.1 which is an internal loopback entry, and the definition for this host, which is squid. 127.0.0.1 is a special address. Any machine that attempts to connect to that address will connect to itself.

The hosts file is used when the machine needs to figure out the IP address of a host, when it knows the hostname.

If you try to telnet to a host which is not in the hosts file, you will see:

```
                    telnet does_not_exist
                    does_not_exist: unknown host

/etc/services       This file should contain an entry for the SQL*Net
                    TCP/IP version 1 server.  If you do not have the proper
                    line in this file, you will get the ORA-6107 error
                    while attempting to use SQL*Net TCP/IP version 1. The
                    line should look like:

                    orasrv          1525/tcp        oracle

/etc/NETADDRS       This file lists the TCP/IP network configuration for
                    the UNIX machine.

                    ao0     139.185.81.95 139.185.81.255 255.255.255.0

                    ao0 refers to the built-in Ethernet device of the
                    server.  139.185.81.95 is the IP address of the server.
                    139.185.81.255 is the broadcast address of the server.
                    255.255.255.0 is the subnet mask for the server.

                    This file is created when you run the newconfig
                    utility.  Checking this file can be helpful to debug
                    TCP/IP connectivity problems and address conflicts.

UNIX Command Management
-----------------------

man         man is a program which displays the help and documentation
            available for a command.

            man <some_command>

            will show you the description of the command, one page at a
            time.  As you are browsing the description, you hit the space
            bar to advance a page, and the return key to advance one line.

apropos     gives a listing of all commands which have a certain text
            string in their description.  This is useful if you remember
            what a command does, but not its name.

            For example, you know you need to reconfigure your UNIX kernel
            to set up certain network services. If you forget which command
            to use, type:

            apropos kernel

            It will give a listing of commands and descriptions, which have
            the word 'kernel' in them.   from that list, you determine that
            the command you were looking for was:

            newconfig(1M)            - generates an up-to-date kernel
```

After finding a command with apropos, check the man page on the command before executing it. It is a good idea to be aware of all of the options available before running a command.

more — more can be called on a file, to display the file a screen at a time. It can also have the output of a command piped through it to show output a screen at a time.

```
ps -ef | more
```

This will give you a long listing of processes, a page at a time.

| (pipe) — The '|' is the UNIX pipe operator. It sends the output of the first command through the second command.

```
some_command | some_other_command
```

some_command will not send its output to the screen, but instead, the output will be read and processed by some_other_command.

grep — grep is a text-searching utility that returns all lines that contain the search condition.

```
grep <some_condition> <some_file>
```

This searches <some_file> for <some_condition>, and returns all lines that match the search criterion.

```
% grep squid /etc/hosts
139.185.81.95 squid.us.oracle.com squid
```

This command lists all lines in the /etc/hosts file with 'squid' in them. When combined with the 'hostname' command above, this is a great way to find out what the A/UX machine's IP address is. In this example, 139.185.81.95 is my IP address, which identifies my machine on the TCP/IP network.

wc — wc counts characters, words, and lines in a file. It can be very helpful to pipe the output of another program through wc.

```
ps -ef | wc
134   1339   8817
```

'ps -ef' gives a long listing of all processes on the machine, and wc tells you that there are 134 lines in that output. This means that there are 134 processes currently running.

head — head <some_file> displays the first 10 lines of a file. This is useful if you just want to peek at the beginning of a file.

'ps -ef | head' lists the first 10 processes.

tail — tail is like head, except it returns the last 10 lines.

which — which will tell you exactly what function or executable will be executed, given a particular command.

'which cc' (This will tell me '/bin/cc' if the C compiler is installed, or tell me 'cc: Command not found' if the C compiler is not installed.)

Process & System Management

ps -ef — gives a long listing of all processes running on the UNIX machine. There are usually MANY processes running on a UNIX machine, so you usually want to pipe the output through 'more' or 'grep'.

```
ps -ef | more
```

This will show you all of the processes a screen at a time. Hit the space bar to see the next page.

```
ps -ef | grep oracle
```

This will give you a full listing of all processes owned by oracle, or with oracle in their name.

```
% ps -ef | grep oracle
   UID   PID  PPID  C    STIME TTY      TIME COMMAND
oracle  1520  1474  5 17:27:48 qa       0:00 ps -ef
oracle  1521  1474  2 17:27:48 qa       0:00 grep oracle
oracle 20307     1  0  Aug 20  p2       0:00 ora_pmon_SAMP
oracle 20308     1  0  Aug 20  p2       0:01 ora_dbwr_SAMP
oracle 20309     1  0  Aug 20  p2       0:05 ora_lgwr_SAMP
oracle 20310     1  0  Aug 20  p2       0:45 ora_smon_SAMP
oracle 20311     1  0  Aug 20  p2       0:00 ora_reco_SAMP
daemon  1473 21954  4 17:08:27 ?        0:26 oracleSAMP
                                                    T:I,1024,5
oracle  1531  1530  0 17:34:55 qa       0:00 oracleSAMP
                                                    AT:I,0,5
oracle  1474  1456  0 17:08:34 qa       0:01 -csh
```

Note: I pasted the titles of the columns into this document for clarity. The UID is the owner of the process. The COMMAND is the name of the process.

In this example, you see that there are 5 processes with the format ora_XXXX_SAMP. These are the processes that make up the ORACLE database named SAMP. The 'oracleSAMP T:I,1024,5' process is called a TCP/IP shadow process, and means that there is a remote user connected to the SAMP database using SQL*Net

TCP/IP. The 'oracleSAMP AT:I,0,5' process is an AppleTalk shadow process, representing a remote connection using SQL*Net AppleTalk.

From time to time, you may have to kill these shadow processes. 'ps -ef | grep oracle' will help you find them.

kill — kill can be used to terminate a process that is no longer needed on your machine.

```
kill <PID>
```

where PID is the process ID of the process you wish to terminate. The PID can be determined by looking at the second column of the ps -ef listing explained above.

For example, as part of the 'ps -ef' listing, I see:

```
daemon  1473 21954  4 17:08:27 ?        0:26 oracleSAMP
                                                T:I,1024,5
```

If I know that no one is connected to the SAMP database using TCP/IP, I can kill the orphaned shadow process with the command:

```
kill 1473
```

Then the process will be dead, and the database will clean up after the connection. If the process does not die, you can use 'kill -9 <PID>' instead, which will definitely kill the process.

& — The ampersand character, when added onto any other command, will run the program in the background, which means that you could run another command in the current window.

```
atksrv Squid
```

would normally just run the program, and you could not type any other commands (except control-c to stop the program).

```
atksrv Squid &
```

runs the same command in the background, meaning that you can run other programs.

jobs — lists the jobs which are currently in the background.

```
jobs
[1]  + Running                 atksrv MyServer
```

% — This command is used to bring a bring a background process to the foreground. In the above example, there was a background

process called 'atksrv MyServer'. Typing % at the prompt would bring the 'atksrv MyServer' process back to the foreground.

If there are multiple processes in the background, you can use '%2' to bring the second process in the list to the foreground.

pstat -m

pstat -m lists current system status, including the amount of physical memory which is currently free.

uptime

uptime tells you how long the UNIX machine has been running, and what the current load average is on the machine. It also tells you the current time, which lets you know if you need to reset the clock on your server.

```
uptime
7:28am  up 54 days, 13:59,  19 users,  load average: 2.29 2.32
2.20
```

The load average tells you how many processes are actively using the processor. At the time I ran this command, there were 130 processes on the machine, but only two of them were active. If I have 5 remote Macintosh clients actively start using one of the databases, the 5 shadow processes would become active, and the load would jump from about 2 to about 7.

ipcs -a

ipcs -m lists the status of all attached blocks of shared memory. An Oracle database uses a block of shared memory to store the SGA (Shared Global Area).

```
ipcs -m
IPC status from /dev/kmem as of Wed Sep 15 07:35:18 1993
T     ID     KEY        MODE       OWNER    GROUP
Shared Memory:
m   2100 0x744c4f57 --rw-------     root     root
m   1501 0x00028d92 --rw-r-----   oracle      dba
m    402 0x00020386 --rw-r-----   oracle      dba
m    203 0x00025a8e --rw-r-----   oracle      dba
m    404 0x0002c003 --rw-r-----   oracle      dba
m    605 0x0002f58f --rw-r-----   oracle      dba
```

The first entry is owned by root, with the root group. This segment is used by the UNIX kernel, and is OK.

Note: the order of the entries in this list does not matter.

The other 5 segments here are blocks which were obtained by Oracle databases on the machine. I know this because the owner is oracle and the group is dba. I can then determine which Oracle databases are running by looking for processes with the letters 'dbwr' in the name, as that is a process which is required by the rdbms.

```
ps -ef | grep dbwr
```

```
root   10355 10242  2 07:39:46 pb       0:00 grep dbwr
oracle  4196     1  0  Sep  2  ?        0:02 ora_dbwr_S6A
oracle  5856     1  0  Sep  8  ?        0:02 ora_dbwr_S6C
oracle  4211     1  0  Sep  2  ?        0:02 ora_dbwr_S6B
oracle  4232     1  0  Sep  2  q4       0:02 ora_dbwr_SAMP
```

Looking at the right column, I see 4 processes with the name ora_dbwr_???, where ??? is the name of the database (SID). The databases S6A,S6B,S6C, and SAMP are active on this machine.

I have 4 running databases, and 5 segments of shared memory attached by Oracle databases. This generally means that a database was terminated abnormally (by killing the processes or a severe crash). That last block of shared memory will not be freed until the system is rebooted.

In situations where you have blocks of shared memory that were not freed, you should reboot the system as soon as you can.

Administrating and Supporting ORACLE7 For A/UX - Part 2 (10/93)

==========

Article Created: 28 October 1993

TOPIC ----------

This technical information was provided by Oracle. This document was not written by Apple or tested for accuracy, but it's included because we feel you might find it useful.

This is part 2 of 2, of an Oracle technical note on Administrating and Supporting ORACLE7 for A/UX. To find part 1 or 2, search for an article titled, "Administrating and Supporting ORACLE7 For A/UX - Part 1 (10/93)."

DISCUSSION ----------

Tips For Administrating and Supporting ORACLE7 For A/UX Desktop
Victor Grigorieff
September 29, 1993 Apple A/UX 3.0.1

Revised: 10/28/93 by Victor Grigorieff

File Management
---

ls ls gives a listing of the files in the current directory.

ls -lF gives a useful long listing, and places a '/' after the name of each directory, and a '*' after each executable program.

ls -a lists all files, including files that begin with the "."

cd cd changes the current directory.

'cd /' changes the active directory to the root of the

filesystem.

'cd ..' changes to the parent directory of the current directory.

pwd — pwd tells you what directory you are accessing.

mkdir — 'mkdir new_directory' makes a new directory called 'new_directory'

cp — cp is the command to copy a file to a new file.

'cp -r' is a recursive copy, which can copy directories and their contents.

mv — mv is the command to move or rename a file. mv is not capable of moving a file from one filesystem to another.

chmod — chmod <new permissions> <some_file> changes the permission bits on a file. chmod is often used to either restrict access to a file, or to enable the 'setuid bit' on an executable program.

A file has certain permission bits, which determine the rights to read, write, and execute the file. These permissions are given differently to the owner of the file, the group to which the file belongs, and everyone else.

ls -l will give a full listing of files, and the left-most column is a listing of permission bits.

```
-rwxr-xr-x   1 oracle   dba      4122655 Jun 19 14:19 sqldba*
```

There are a total of 10 characters in the left column.

The first character is '-' for a file, and 'd' if the item is a directory.

The next 9 characters are 3 groups of 3 characters each. Each group determines the rights to read, write, and execute.

rwx means that read, write, and execute rights are enabled
r-x means that read and execute are enabled, but writing is not.

If the letter is present in a particular position, the right is enabled. If there is a '-', the permission is disabled.

The first group of letters corresponds to the rights granted to the owner of the file. The userid listed in the third column of the ls -l output is the owner of the file.

** If the owner's permissions are 'rws', then the setuid bit
** is set, meaning that the program will run with all of the

```
                ** rights as the owner of the program, regardless of who
                ** invokes the program.

              The second group of letters corresponds to the rights of the
              group to which the file corresponds, which is the fourth
              parameter of the ls -l output.

              The third group of letters defines the permissions for
              everybody.

              -rwxr-xr-x means that everyone can read and execute the file,
                         but only the owner can write (modify) it.

              -rwsr-x--- means that the setuid bit is enabled, people in the
                         group which owns the file may read and execute the
                         file, but people outside of the group have no access
                         to the program.

              To set the permissions, you need to assemble a string of 3
              numbers to tell chmod how to set the permissions. Different
              privileges are enabled by adding up the numbers below:

              read -    4
              write -   2
              execute - 1

              read and execute privilege (4 + 1) are 5
              read, write, and execute (4 + 2 + 1) are 7
              to set the setuid bit, you prefix your string with the number
              4.

              chmod  755  (yields -rwxr-xr-x)
              chmod  400  (yields -r--------)
              chmod 4755  (yields -rwsr-xr-x)  (The setuid bit is enabled)

              The files 'orasrv' and 'oracle' (which are located in the
              /users/oracle/bin) should be -rwsr-xr-x.  You can set these
              permissions with the command:

              chmod 4755 orasrv oracle

chown         chown <new_owner> <some_file> changes the ownership of
              <some_file> to be owned by <new_owner>.  Only the current owner
              or the superuser (root) may issue this command.

              Only the owner and the superuser (root) may delete a file.
              the ownership of a file is usually most important with
              executable files that have the setuid bit set (see chmod
              above).

              *** Note:  when you change the ownership of a file, the
              ***        permission bits can be changed.  You may need to use
              ***        the chmod command to get the proper setting.
```

chgrp chgrp <new_group> <some_file> changes the group ownership of <some_file> to be owned by <new_group>. Only the current owner or the superuser (root) may issue this command.

find find can be used to locate files, and perform an action on each of them if desired.

```
find . -exec ls -l {}\;
```

This command looks a bit confusing, but it gives a long listing of the files in the current directory, as well as all of the subdirectories. Check the manual pages on find for more detailed information.

tar tar creates archives and extracts data from them.

```
tar -cf archive.tar something
  (creates a new archive called 'archive.tar' containing a copy
   of 'something'.  Something could be a file, or a filesystem)

** Note: NEVER try to back up a database that is RUNNING.
**       copies of running databases WILL NOT WORK.

tar -xf archive.tar
  (extracts the contents of archive.tar into the current
   directory)
```

compress 'compress some_file' will create a compressed version of the file called some_file.Z, and deletes some_file. You must uncompress the some_file.Z before using it again.

Filesystem Management

If you are not familiar with filesystems, mounting of filesystems, or disk setup in general on A/UX 3.0.1, please refer to the "Disk Setup" section of Bulletin #103947.028 -- "Setting up an AWS 95 Server for ORACLE7 for A/UX".

df -B df will give you a line of information for each of the mounted filesystems. Note the capital letter 'B', which specifies that the results should be given in kilobytes.

```
df -B
Filesystem        kbytes    used   avail %used  Mounted on
/dev/dsk/c0d0s0   140519  125637    7856   94%  /
/dev/dsk/c300d0s  637015  523524   81640   87%  /u1
/dev/dsk/c401d0s 1122889  805559  261185   76%  /u2
```

This command tells you which filesystems were successfully mounted, where they are mounted, how big they are, and how much space is available on each of them.

```
            ** Notice that the 'Filesystem' column is not giving you the
            ** first 16 letters in the name of the disk device file.  If
            ** you need the full name, check the /etc/fstab file, or use
            ** the df command without the -B flag.
```

/etc/fstab the fstab file has one line for each filesystem which should be mounted. It specifies the type of filesystem, where to mount it, and on what device it resides.

```
            # fstab for Squid 6/23/93
            #
            /dev/dsk/c300d0s0       /       ignore  rw      1 0
            /dev/dsk/c300d0s2       /u1     4.2     rw      1 0
            /dev/dsk/c401d0s2       /u2     4.2     rw      1 0
```

The lines that begin with # are ignored. It is a good idea to put notes in this file that identify which machine it belongs to, and when it was last modified. Whenever you modify this file, you should PRINT it and put it somewhere safe.

```
          *** IMPORTANT:  having a printout of the fstab file is very
          ***             helpful if your machine has a damaged root
          ***             partition, and you need to remember where all of
          ***             your filesystems reside.  You need to know the
          ***             location of your root filesystem.
          ***             /dev/dsk/c300d0s0 is the default, but it may be
          ***             different on your system.

          ***  I like to tape a printout of this file to the machine.
```

fsck fsck checks filesystem consistency and interactively repairs the filesystem. If a filesystem will not mount, you need to run fsck on it to verify and fix it. fsck works on a disk device file that corresponds to the filesystem in question. If the filesystem which normally mounts fine on u1 is not mounting, I need to run fsck. I can't just run 'fsck u1'. I need to run fsck on the disk device file that was listed in the /etc/fstab file that corresponds to the problematic filesystem.

```
            squid.root # fsck /dev/dsk/c300d0s2
            ** /dev/dsk/c300d0s2
            ** Last Mounted on /u1
            ** Phase 1 - Check Blocks and Sizes
            ** Phase 2 - Check Pathnames
            ** Phase 3 - Check Connectivity
            ** Phase 4 - Check Reference Counts
            ** Phase 5 - Check Cyl groups
            FILE SYSTEM STATE IS MARKED AS DIRTY
            FIX?
```

When you find out "FILE SYSTEM STATE IS MARKED AS DIRTY", you do NOT ALWAYS want to fix that.

** If the filesystem is currently mounted (it shows up when you use the df command), it will be DIRTY, which is OK. Filesystems are dirty when there is data in buffers that has not been written out to disk, which is fine if the filesystem is mounted and in use. If this is the case, choose N.

** If the filesystem is not mounted (it does not show up when you use the df command) then you should choose Y.

If an Oracle database (or some other program) is writing to a file on a filesystem at the time a server goes down (crashes), then the filesystem will not mount when the server comes back up. You need to run fsck to repair the dirty filesystem.

If the dirty filesystem is the root (/) filesystem, then A/UX will not boot. The A/UX Startup program will tell you that the root filesystem (/dev/dsk/c0d0s0) is dirty, and will present you with a window in which you can issue some UNIX commands. Try:

```
fsck /dev/dsk/c300d0s0
```

Once fsck completes the repairs on the filesystem, you should be able to type the command 'boot' to start A/UX.

mount -a

mount -a will attempt to mount every filesystem listed in the /etc/fstab file. If mount -a returns no information, that means that it had no problem. If it gives you errors, that means that either the /etc/fstab file is not set up properly, or the filesystem is damaged and should be checked with fsck.

mount -a is automatically called at startup time. You should only need to use this command after modifying the /etc/fstab file or after repairing a filesystem with fsck.

Unix Shells

.login

The .login file is in the home directory of each user. The .login file contains commands which are executed automatically when the user logs in to the UNIX machine.

It is often helpful to set the following in the .login file:

```
setenv ORACLE_HOME /users/oracle
setenv ORACLE_SID  SAMP
setenv PATH        "/users/oracle/bin:/bin:/usr/bin:/usr/ucb:
                   /mac/bin:/etc:/usr/etc:/usr/local/bin"
```

Adding these lines to the .login file will set these variables automatically when you next login, or use the source command.

PATH — PATH is the environment variable which lists the directories on the UNIX machine that will be searched when a command is typed. If I type 'do_something', and there is no program called 'do_something' in the current directory, the shell will search all the directories listed in the PATH for an executable program called 'do_something'. A default PATH may look like:

```
PATH=:/bin:/usr/bin:/usr/ucb:/mac/bin:/etc:/usr/etc:/usr/local
      /bin
```

If you try to use the oracle program called 'sqldba' you will see:

```
sqldba
sqldba: Command not found.
```

If you want to be able to use Oracle commands, you should add the bin directory of the oracle home to the PATH. This is '/users/oracle/bin' by default. Then the PATH would look like:

```
PATH=:/bin:/usr/bin:/usr/ucb:/mac/bin:/etc:/usr/etc:/usr/local
      /bin:/users/oracle/bin
```

In this case, the PATH references /users/oracle/bin, so the sqldba command can be used without problem.

csh — csh is the C shell, which is the default shell for each user except root. Use the setenv command to set environment variables. when running the C shell. This is also known as /bin/csh.

setenv — setenv sets environment variables under csh.

'setenv SOME_VARIABLE some_contents' sets the variable SOME_VARIABLE to be some_contents.

There are 3 environment variables which are important under A/UX. They are ORACLE_HOME, ORACLE_SID, and PATH.

```
ORACLE_HOME = /users/oracle ( This is the directory where the
                              oracle files and executables
                              reside )
ORACLE_SID  = SAMP          ( This is the name of the default
                              database, which is SAMP )
PATH = ../users/oracle/bin.. (discussed in PATH section above)
```

sh — sh is the Bourne shell, which is the default user for the root user. This is also known as /bin/sh.

To set an environment variable in the Bourne shell, you can do:

```
SOME_VARIABLE=some_contents; export SOME_VARIABLE
```

```
              It is important to add the '; export SOME_VARIABLE' to the
              line, as otherwise programs that you run will not be able to
              evaluate that environment variable.

              ORACLE_SID=SAMP; export SAMP

              This sets the ORACLE_SID to be SAMP, and allows other programs
              you run (like Oracle utilities) to read the variable.

env           env lists the names and contents of all variables in the
              current shell's environment.

source        source is used to read in a configuration file.  If you edit
              the .login file, and want the changes to take effect, you can
              log out and log in again, or read in the file.  To read in the
              .login:

              source .login

              This will run all of the commands in the .login file.

Oracle Database Management
--------------------------

tcpctl        tcpctl is a command to help you start, stop, and get the status
              of the SQL*Net TCP/IP version 1 listener.

         **   'tcpctl status' should give you the status of orasrv.

              tcpctl status
              tcputl: Status summary follows
              Server is running:
                Started             : 8-SEP-93 12:08:51
                Last connection     : 15-SEP-93 11:09:17
                Total connections   : 87
                Total rejections    : 3
                Active subprocesses : 9
                ORACLE SIDs         : S6A,S6B,S6C,S7F,SAMP
                Default SID         : (null)
              Logging mode is ENABLED.
              DBA logins are DISABLED.
              OPS$ logins are ENABLED.
              OPS$ROOT logins are DISABLED.
              Orasrv is detached from the terminal.
              Break mode = IN BAND.
              Debug level = 1
              No timeout (on orasrv handshaking).
              Length of listen queue = 10
              Orasrv logfile = /u2/7012f/tcp/log/orasrv.log
              Orasrv mapfile = /etc/oratab

              This tells you that the server is running, and has been running
              for a week.  It has serviced 87 connections since it was
```

started, and there are currently 9 connections made to the server. The active SIDs were read in from the /etc/oratab file.

If the server is not running, it will look like:

```
tcpctl status
tcputl: server is not running: Connection refused
```

** 'tcpctl start' should start the TCP/IP listener process (orasrv).

```
tcpctl start
tcpctl: log file is /u2/7012f/tcp/log/orasrv.log
tcpctl: SID mapping file is /etc/oratab
tcpctl: server will be run under oracle
tcpctl: logging mode is on

orasrv: Release 1.2.7.5.1 - Production on Wed Sep 15 12:01:06
1993

Copyright (c) Oracle Corporation 1979, 1993. All rights
reserved.

Starting server on port 1525.
tcpctl: server has been started
```

This means that server was successfully started on port 1525 (which was read in from the /orasrv entry of the etc/services file).

You may get the following error if you try to issue the 'tcpctl start' immediately after issuing a 'tcpctl stop':

```
Starting server on port 1525.
orasrv: server already running: Address already in use
```

If this happens, wait a few minutes and try again, while the UNIX operating system releases the port.

** 'tcpctl stop' should stop the TCP/IP listener process (orasrv).

'tcpctl stop' requires that you log into the A/UX machine as the user who started the server. You must actually log into the machine or telnet to the machine to have the proper privileges. If I log in as a user who is not a dba, and use the 'su - oracle' command to become the oracle user, it will not work:

```
tcpctl stop
tcputl: checking user permission...
tcputl: permission denied
```

If I then telnet to this machine as oracle, or log out and log in as oracle, it will work:

```
tcpctl stop
tcputl: checking user permission...
tcputl: server has been stopped
```

You can also stop the orasrv process by killing it.

```
ps -ef | grep orasrv   (this finds the orasrv process...)
oracle   692       1  0  Sep 21  ?        0:02 orasrv
vgrigori 16358 15344  2 18:17:44 p2       0:00 grep orasrv

kill 692  (This kills the orasrv process.)
```

orasrv — orasrv is the SQL*Net TCP/IP version 1 listener process which is controlled by the tcpctl program.

atksrv — atksrv is the SQL*Net AppleTalk version 1 listener process. It is invoked with the command atksrv.

```
atksrv Squid
atksrv: Release 1.0.1.2.1 - Production on Wed Sep 15 12:38:06
1993

Copyright (c) Oracle Corporation 1979, 1993.  All rights
reserved.

Server name is Squid

Server Squid[10790] is accepting connections....
```

* If you get the error: Cannot register service "Squid" on network, that means that there is an AppleTalk listener using that name already in your zone of the AppleTalk network.

The [10790] tells you the PID of the atksrv process. You can stop the atksrv listener by hitting control-C, or by killing the process manually from another UNIX prompt.

You could also kill the atksrv process in the same way you could kill the orasrv process, which is described in the tcpctl section.

sqldba — sqldba is the utility used to administrate the Oracle database. It can create, startup, and shutdown databases. If the database is not running, you can only connect to it by using 'connect internal'. Once connected internally, you may startup and shutdown the database.

```
sqldba
```

```
SQL*DBA: Release 7.0.12.2.0 - Production on Wed Sep 15 12:44:56

Copyright (c) Oracle Corporation 1979, 1993.  All rights
reserved.

ORACLE7 Server Release 7.0.12.2.0 - Production
With the procedural and distributed options
PL/SQL Release 2.0.14.0.1

SQLDBA> connect system/manager
ORA-01034: ORACLE not available
ORA-07318: smsget: open error when opening sgadef.dbf file.
Macintosh A/UX Error: 2: No such file or directory
```

The above error occurs when the database is not running. If you are logged in as a user in the dba group, you may connect internally and startup the database.

```
SQLDBA> connect internal
Connected.
SQLDBA> startup
ORACLE instance started.
Database mounted.
Database opened.
Total System Global Area       7319428 bytes
              Fixed Size         30492 bytes
           Variable Size       6453352 bytes
        Database Buffers        819200 bytes
            Redo Buffers         16384 bytes
```

After starting up the database, you may connect as a database user.

```
SQLDBA> connect scott/tiger
Connected.
```

You could then connect internally and shutdown the database.

```
SQLDBA> connect internal
Connected.
SQLDBA> shutdown
Database closed.
Database dismounted.
ORACLE instance shut down.
```

Loopback

You could then attempt a TCP/IP connection to the database (provided you have started the orasrv process). This is called a loopback, as the server machine is making a connection to itself, which is a useful test of the server's functionality.

```
SQLDBA> connect scott/tiger@t:squid:S7F
Connected.
```

* You may get errors trying to do the loopback.

ORA-6114 - problem with the SID you specified. Compare the SID you tried with the /etc/oratab file.

ORA-6401 - you did not install SQL*Net TCP/IP.

ORA-3113 - you probably did not install the C programming option of A/UX and oracle was not properly installed.

ORA-6107 - you need to add the orasrv entry to /etc/services.

ORA-6105 - you need to add the server's hostname to /etc/hosts

ORA-6108 - orasrv is not running, or you have the wrong IP address entered for your server in /etc/hosts. Refer to the description of ping above.

ORA-1034 - orasrv is running properly, but the rdbms is not. Use sqldba to start the database.

ORA-7318 - This error usually follows ORA-1034, but it means the same thing. The database is not running.

/etc/oratab - This file lists the instances (SID's) available on the A/UX machine. The has one line per database on the machine. Lines beginning with '#' are comments which are ignored. Each line is made up of the format:

SID:ORACLE_HOME:STARTUP

Where: SID is the name of the database
ORACLE_HOME is where you installed the database
STARTUP is either Y or N, which indicates whether the dbstart and dbshut utilities should start or stop that database.

The default /etc/oratab should have the line:

SAMP:/users/oracle:N

This means that I have one database on my machine, it is named SAMP, and the ORACLE_HOME for the SAMP database is /users/oracle. The ORA-6114 error occurs if you attempt to connect to a database that is not listed in the oratab file.

*** The capitalization of the SID is important
*** 'SAMP' is different from 'samp'.

AppleShare 4.x.x Versions: Which Computers Supported (5/96)

==========

Article Created: 5 January 1994
Article Reviewed/Updated: 30 May 1996

TOPIC ----------

This article details the supported computers for AppleShare 4.x.x.

DISCUSSION ----------

The following chart details the supported computers for AppleShare versions 4.0, 4.0.1, 4.0.2, 4.1, 4.2, and 4.2.1:

Begin_Table

Supported Computer	4.0	4.0.1	4.0.2	4.1	4.2	4.2.1
Centris 610	X	X	X			
Centris 650		X	X			
Centris or Quadra 660AV						
LC 475		X	X			
LC 575		X	X			
LC 630		X	X			
Quadra 605		X	X			
Quadra 610 or AWS 60	X	X	X			
Quadra 630		X	X			
Quadra 650		X	X			
Quadra 700	X	X	X			
Quadra 800 or AWS 80	X	X	X			
Quadra 840AV						
Quadra 900		X	X			
Quadra 950	X	X	X			
Power Macintosh 6100/60			X	X	X	X
Power Macintosh 6100/60AV			X	X	X	X
Power Macintosh 7100/66			X	X	X	X
Power Macintosh 7100/66AV			X	X	X	X
Power Macintosh 8100/80			X	X	X	X

Power Macintosh 8100/80AV	X	X	X	X
Power Macintosh 6100/66		X	X	X
Power Macintosh 7100/80		X	X	X
Power Macintosh 7100/80AV		X	X	X
Power Macintosh 8100/100		X	X	X
Power Macintosh 8100/100AV		X	X	X
Power Macintosh 8100/110		X	X	X
Power Macintosh 7200/75/90				X
Power Macintosh 7500/100				X
Power Macintosh 8500/120/132				X
Power Macintosh 9500/120/132				X
Workgroup Server 6150	X	X	X	X
Workgroup Server 8150	X	X	X	X
Workgroup Server 9150	X	X	X	X
Workgroup Server 6150/66		X	X	X
Workgroup Server 8150/110		X	X	X
Workgroup Server 9150/120		X	X	X
Workgroup Server 7250/120				X
Workgroup Server 8550/132				X

End_Table

Note: AppleShare 4.2.1 is compatible with Open Transport on PCI-based Power Macintosh 7200, 7500, 8500, and 9500 series computers. Apple has not certified AppleShare 4.2.1 and Open transport on NuBus based Power Macintosh computers and Workgroup servers.

Note: There is a special version of AppleShare 4.0.2 for Power Macintosh computers. AppleShare 4.0.2 for Power Macintosh is no longer sold separately.

Note: AppleShare 4.0.1 supports all 68040-based Macintosh computers except the Macintosh Centris/Quadra 660AV and Quadra 840AV due to incompatibility. AppleShare is not recommended or supported when using a Power Macintosh Upgrade Card. There is no performance benefit with the Upgrade Card.

Note: From a functionality standpoint, AppleShare 4.0.1 is identical to the product "AppleShare 4.0.2 for 68040-based Macintosh Computers." Therefore, there is no need to upgrade AppleShare 4.0.1 to AppleShare 4.0.2. The only differences between these versions are the version number itself and the fact that AppleShare 4.0.2 is available in a complete retail package, while AppleShare 4.0.1 is available as a tune-up only and must be installed over an existing copy of AppleShare 4.0.

Note: The Workgroup Server 95 uses only AppleShare Pro (v 1.0 or 1.1). None of the other versions of AppleShare (shown in this article) is supported on the Workgroup Server 95. AppleShare Pro only works with the specific version of System Software (A/UX) it ships with.

Note: The AppleShare 4.0 column is left here for information purposes, users are recommended to upgrade to at least AppleShare 4.0.1.

Article Change History:

30 May 1996 - Updated for AppleShare 4.0.2.
24 May 1996 - Updated for AppleShare 4.2.1
21 Mar 1996 - Added Workgroup Server 95 comment.

Color Plus14" Display: Mac II Video is Compatible (12/93)

==========

Article Created: 23 December 1993

TOPIC -----

Will the Mac II Video Card (8Bit) drive the Apple Color Plus Display?

DISCUSSION -----

Yes. The Color Plus has the same sweep rate as the previous HighRes RGB monitor, for which the Mac II video card was originally designed.

Troubleshooting Macintosh System 7 INIT Conflicts (2/95)

==========

Article Created: 22 December 1993
Article Reviewed/Updated: 16 February 1995

TOPIC ----------

An Extension conflict results when an extension or control panel is incompatible with other software on your Macintosh. This document will help you determine whether an extension is causing erratic or unexpected behavior. An example of erratic behavior is a "frozen" screen that prevents continued use of the computer. This document also tells you how to resolve the conflict.

DISCUSSION ----------

These instructions call for you to test for the problem at regular intervals. To test for a problem, repeat the actions you took just before you saw the problem on your computer.

An easily reproducible problem facilitates testing (for example, if your screen freezes whenever you insert a floppy disk). However, you can also use this procedure to troubleshoot intermittent problems -- it will simply take longer to test for them.

What's an INIT?

System files that contain INIT resources are collectively referred to as INITs. The purpose of an INIT resource is to load into random access memory (RAM) at startup time and modify the standard behavior or add new features to the Macintosh operating system.

System extensions, control panels (cdevs) and Chooser extensions (rdevs) may contain an INIT resource. Control panels differ from system and Chooser extensions in that a control panel has a user interface where you can modify the parameters. System and Chooser extensions have no user interface to modify parameters.

In general, the term extension is used interchangeably with INIT, and refers to

any of those files that contain an INIT resource. For more information about system files and what they do, read the Tech Info Library article "Macintosh System Folder: Files Described."

TROUBLESHOOTING PROCEDURE

Follow these instructions in the order presented.

Turn Off Some Control Panel Settings

Turn off some of the control panel settings to check application compatibility with certain System 7 features.

Step 1
Open the Memory control panel, click on Use Defaults, and restart your computer. This will turn off virtual memory and 32-bit addressing, and reset the disk cache to its default settings.

Step 2
Turn off file sharing in the Sharing Setup control panel.

Step 3
Test for the problem with these features turned off.

Some applications may be incompatible with these System 7 features. So if this resolves the problem, contact the application vendor.

Disable Extensions

Note:
In cases where it isn't feasible to disable ALL extensions (for example, if you're having problems launching an application that requires the QuickTime extension) skip to the Isolating Extensions section.

Verify that the problem is related to extensions, following these steps:

Step 1
Make sure the Caps Lock key is off, and restart your Macintosh.

Step 2
After you see the smiling Macintosh, hold down the Shift key.

Step 3
If you are using System 7.5, hold down the Spacebar until the Extension Manager appears on screen. Select "System 7.5 Only: from the Sets menu. This will load only those extensions installed during your original System 7.5 installation.

Step 4
Release the Shift key when the "Welcome to Macintosh, Extensions Off" message appears.

Step 5
When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have an Extension conflict.
Continue with the next section.

Identify the Conflicting Extension

Step 1
Create a new folder on the desktop called "Removed Extensions."

Step 2
Move all items of Kind "system extension," "control panel," or "Chooser extension" from the System Folder, Extensions folder, and Control Panels folder to this new folder. When you open these folders, choose "by Kind" from the View menu to help identify the files you need to move.

Step 3
Close the System Folder, and restart the Macintosh. Test for the problem.

Note: If the problem still occurs, check your System Folder to make sure you've removed all the extensions and control panels.

Step 4
Move one item from the new folder on the desktop to the closed System Folder and restart the Macintosh.

Step 5
Attempt to recreate the original problem.

Repeat steps 4 and 5 for each item in the Removed Extensions folder until the problem recurs. The last item returned to the System Folder is likely to bo be the cause of the problem.

Install the Compatible Version

Contact the extension developer for compatibility information. If you have the compatible version, reinstall it from the original disk or from your backup.

If you still have problems with an extension which should be compatible, follow the instructions for isolating this extension from the others on your system.

Isolating Extensions

Follow the steps in this section when you need to test a single extension in isolation. For example, if you just installed the Macintosh PC Exchange control panel, and it doesn't work properly, the cause may be a conflict with another extension.

Make sure you have a startup floppy disk available (that is, a floppy disk containing a System Folder and enabler if required). You can use the Disk Tools disk.

Step 1
Open the hard disk icon and create a new folder called "Test Folder."

Step 2
From the root level of the System Folder, drag the System and Finder files to the Test Folder. Also move any files called System Enabler followed by a 3-digit number, from the root level of your System Folder to the Test Folder.

Step 3
Drag the extension or control panel you wish to test in isolation to the Test Folder as well.

Step 4
Restart the Macintosh.

Note:
If you experience problems starting up, restart with the startup floppy disk, and make sure you've moved the correct files to the Test Folder.

Step 5
Test for the problem.

Step 6
If the problem recurs, you may have an incompatible extension, or some damage to the System file. Check the compatibility and reinstall the extension and the system software if necessary.

Step 7
If the problem doesn't recur, there's some incompatibility between extensions. Drag the System, Finder, System Enabler (if any), and the extension you're testing back to the System Folder.

Note:
Don't drag any of the folders you may see in the Test Folder back to your System Folder. The system automatically creates these empty folders.

Follow the instructions in the "Identify Conflicting INIT" section, with this important exception -- remove all system extensions and control panels from the System Folder except the one you're testing. Begin with this extension in place, and add the others one at a time until the problem recurs.

If after following all the above procedures and the problem continues, it is recommended that a clean system software install be performed.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
16 Feb 1995 - Fixed some steps that were numbered incorrectly.

Troubleshooting Macintosh System 6 INIT Conflicts (8/94)

Revised: 6/5/96
Security: Everyone

Troubleshooting Macintosh System 6 INIT Conflicts (8/94)

==========

Article Created: 22 December 1993
Article Reviewed/Updated: 30 August 1994

TOPIC ----------

An "INIT conflict" results when a startup document or control panel is incompatible with other software on your Macintosh computer. This document will help you determine whether an INIT is causing erratic or unexpected behavior. An example of erratic behavior is a "frozen" screen that prevents continued use of the computer. This document also tells you how to resolve the conflict.

DISCUSSION ----------

These instructions call for you to test for the problem at regular intervals. To test for a problem, repeat the actions you took just before you saw the problem on your computer.

An easily reproducible problem is easy to test (for example, if your screen freezes whenever you insert a floppy disk). However, you can also use this procedure to troubleshoot intermittent problems – it will simply take longer to test for them.

WHAT'S AN INIT?

System files that contain INIT resources are collectively referred to as INITs (pronounced in-its). The purpose of an INIT resource is to load into random access memory (RAM) at startup time and modify the standard behavior or add new features to the Macintosh operating system.

Control panels (cdevs) and Chooser extensions (rdevs) may contain an INIT resource. Control panels differ from Chooser extensions in that a control panel has a user interface where you can modify the parameters. Chooser extensions have no user interface to modify parameters.

In general, the term extension is used interchangeably with INIT, and refers to any of those files that contain an INIT resource.

TROUBLESHOOTING PROCEDURE

Follow these instructions in the order presented.

Turn Off INITs

Note: In cases where it isn't feasible to turn off all INITs (for example, if you're having problems launching an application that requires a particular INIT), skip to the Isolating INITs section.

1) Create a new folder on your hard disk named "INITs."

2) Move all items of kind "Startup Document" or "Control Panel" from the System Folder to this new folder. When you open the System Folder, choose by Kind from the View menu to help identify the files you need to move.

3) Close the System Folder, restart the Macintosh, and attempt to recreate the problem. If an INIT conflict is causing the problem, you won't be able to reproduce the problem at this step.

   Note: If the problem still occurs, check your System Folder and make sure you've removed all the startup documents and control panels. If you've followed these instructions correctly, then your problem isn't related to INIT conflicts. You may want to try other troubleshooting methods, such as reinstalling your application or system software.

4) Move one item from the INITs folder to the closed System Folder and restart the Macintosh.

5) Attempt to recreate the original problem.

Repeat steps 4 and 5 with each item in the INITs folder until the original symptom recurs. The last item returned to the System Folder is probably the cause of the problem.

Install the Compatible Version

Contact the INIT developer for compatibility information. If you have the compatible version, reinstall it from the original floppy disks or from your backup.

If you still have problems with an INIT which should be compatible, follow the instructions for isolating this INIT from the others on your system.

Isolating INITs

Follow the steps in this section when you need to test a single INIT in isolation. For example, if you just installed a new control panel, and it doesn't work properly, the cause may be a conflict with another INIT.

Make sure you have a startup floppy disk available (that is, a floppy disk

containing a System Folder). You can use the System Tools, Utilities 1, or System Startup disk for this purpose.

1) Open the hard disk icon and create a new folder called "Test Folder."

2) From the root (top) level of the System Folder, drag the System and Finder files to the Test Folder.

3) Drag the startup document or control panel you wish to test in isolation to the Test Folder as well.

4) Restart the Macintosh.

   Note: If you experience problems starting up, restart with the startup floppy disk, and make sure you've moved the correct files to the Test Folder.

5) Test for the problem.

6) If the problem recurs, you may have an incompatible INIT, or some damage to the System file. Check the compatibility and reinstall the INIT and the system software if necessary.

7) If the problem doesn't recur, there's some incompatibility between INITs. Drag the System, Finder, and the INIT you're testing back to the System Folder.

Follow the instructions in the Identify Conflicting INITs section, with this important exception -- remove all startup documents and control panels from the System Folder except the one you're testing. Begin with this INIT in place, and add the others one at a time until the problem recurs.

AppleScript Scripter's Toolkit: Technical Specifications(5/95)

Revised: 5/23/95
Security: Everyone

AppleScript Scripter's Toolkit: Technical Specifications(5/95)

==========

Article Created: 20 December 1993

TOPIC -----

This article gives the technical specifications for the AppleScript Scripter's Toolkit.

DISCUSSION -----

APPLESCRIPT SYSTEM EXTENSION VERSION 1.1

Memory Utilization

- At rest: 2K
- In use: 330K of code, 150K of data

System Extension File Size

- <400K

Storage Management

- Automatic garbage collection

Format of Compiled Scripts

- Universal AppleScript byte code

Optimization

- Run time optimized for speed
- Compiler optimized for storage efficiency

APPLESCRIPT LANGUAGE CHARACTERISTICS

Features

Object-oriented design with:
- Single-level inheritance
- Persistent data objects
- Control-flow commands
- Recursive subroutines
- Exception handling
- Conditionals
- Pattern-matching parameter lists
- Keyword and positional subroutine–calling conventions

Data Types

- Integer
- Real
- Date
- Time
- Text
- Lists
- Records
- And any application-specific data

Data Value Size

- 512MB maximum

Open Scripting Architecture (OSA) Compliance

- Fully compliant with the OSA, a cross-platform industry standard with widespread and growing application support (more than 80 Macintosh applications currently support the OSA)

Access to Third-party Application Data

- Uses Apple events

Transportability of Compiled Scripts

- Easily transportable (can even send compiled scripts as arguments to remote machines)

SCRIPT EDITOR VERSION 1.1 CAPACITIES

- Ability to edit, record, and compile scripts
- Display scripts in multiple languages
- Monitor Apple events and values returned
- Save scripts as compiled scripts or as stand-alone script applications
- Script with multiple scripting components (for example, QuicKeys)

SCRIPTABLE TEXT EDITOR VERSION 1.1 CAPACITIES

- Scriptable and recordable by any OSA-compliant scripting system

• Ability to have up to six text documents open simultaneously and edit text files up to 32K in length

INTERFACE PROCESSOR FROM SOFTWARE DESIGNS UNLIMITED, INC.

Capacities

• Ability to have up to 9 projects open simultaneously; any number of windows per project; any number of window items per window; any number of menus and menu items; and up to 32,767 characters per script for each project, window, and window item

Interface

• Graphical tools to draw all interface elements
• Ability to copy and paste all design elements and scripts
• Ability to import pictures and icons from any file
• Pixel and grid positioning and sizing
• Undo, Redo, and Revert functions
• Ability to set properties of all design elements
• Message window for commands
• Instant "play" of all interface elements
• Incremental application design and testing
• Pop-up references for messages and properties
• Ability to create custom design and editing tools

Design Elements

• Buttons: a variety of standard and custom button types
• Lists: plain and styled text, icons, pictures, multicolumn, draggable, multiselection
• Text: editable or not; wrapped or not; font, style, and color control; key filters; scrolling
• Pop-ups: text, icon, picture, color palettes
• Movies: QuickTime format
• Drawn graphics: lines and rectangles
• Menus: standard and application-specific

SYSTEM REQUIREMENTS

• Any Apple Macintosh computer with at least 4MB of RAM and a hard disk drive (the interface processor requires a 68020 or later microprocessor)
• Macintosh system software version 7.0 or later (interface processor requires version 7.0.1 or later)

ORDERING INFORMATION

AppleScript Scripter's Toolkit

Domestic Order No. M1730LL/A
International Order No. M1730Z/A

- AppleScript language, system software extension, and script editor
- Interface processor from Software Designs Unlimited, Inc.
- English, French, and Japanese Kanji AppleScript scripting dialects
- AppleScript Language Guide —- English Dialect
- Building Interfaces for AppleScript
- AppleScript Scripting Additions Guide —- English Dialect
- Getting Started with AppleScript
- AppleScript Guide to Scriptable Applications
- Redistribution license for AppleScript system software and interface processor run-time code

Apple Phone: Feedback When Using Hands Free Mode (12/93)

Revised: 12/22/93
Security: Everyone

Apple Phone: Feedback When Using Hands Free Mode (12/93)

==========

Article Created: 22 December 1993

TOPIC ----------

I'm using the Apple Phone 1.0 application with my Quadra 840AV and GeoPort Telecom Adapter in hands free mode. I'm getting feedback from the speakers in the AudioVision 14-inch Display. How can I eliminate the feedback?

DISCUSSION ----------

The feedback is a result of a design deficiency in the Apple Phone application. Apple Phone does not have Echo Cancellation Code to prevent feedback. There are several workarounds you can use to eliminate the feedback:

1) If you are using the AudioVision 14-inch Display, set the volume controls to their midpoints. This will eliminate much of the feedback.

2) Connect the PlainTalk microphone to the microphone jack on the Macintosh or to the Monitor, if applicable. Position the microphone away from and behind the speakers to reduce the feedback.

3) Connect a pair of headphones to the sound out jack. This will eliminate all feedback.

Apple Phone: Audio on Left Speaker Only (12/93)

Revised: 12/22/93
Security: Everyone

Apple Phone: Audio on Left Speaker Only (12/93)

==========

Article Created: 22 December 1993

TOPIC --------------------

When using Apple Phone software on my Quadra 660AV, audio is heard on the left external speaker only. How do I get audio to play on both speakers?

DISCUSSION --------------------

Apple Phone plays audio through the left channel. This is the equivalent to the internal speaker on the Quadra 660AV. There is no way to play Apple Phone audio on both left and right external speakers.

AWS 95: System Configurations With Jan. 1994 Release (1/94)

Revised: 1/4/94
Security: Everyone

AWS 95: System Configurations With Jan. 1994 Release (1/94)

==========

Article Created: 5 January 1994

TOPIC -----

This article describes the new system configurations of the Apple Workgroup Server (AWS) 95 with the January 1994 release.

DISCUSSION -----

Apple currently ships three AWS 95 configurations, and will only create two additional configurations with the January 1994 release. All three configurations will be equipped to install either the file/print environment or database tuned environment. Pacific configurations will be announced shortly.

Customers who purchase an AWS 95 in December 1993, January 1994, or February 1994 will receive a software upgrade free of charge. Customers will be required to prove that they purchased the AWS 95 in December, January, or February with an invoice.

USA Configuration:

Current Plan AWS 95	Jan. 1994 Release AWS 95
1) M6855LL/A • 16MB Memory, 128KB L2 Cache, 230MB Disk	1) Same as AWS 95, phase in new software/disk • 16MB Memory, 128KB L2 Cache, 250MB Disk
2) M6875LL/A • 32MB Memory, 512KB L2 Cache, 1GB Disk, DAT Tape, AppleShare Pro	2) M3074LL/A • 32MB Memory, 256KB L2 Cashe, 2GBDisk, DAT Tape, AppleShare Pro

3) M6895LL/A • 48MB Memory, 512KB L2 Cache, 230MB Disk, 1GB Disk, DAT Tape	3) M3075LL/A • 48MB Memory, 512KB L2 Cache, 250MB Disk, 2GB Disk, DAT Tape
M6940Z/A • PDS Card Upgrade #1: PDS Card and A/UX	Same as AWS 95, phase in new SW • PDS Card Upgrade #1: PDS Card and A/UX
M6945Z/A • PDS Card Upg #2: PDS Card, DAT Tape, A/UX	Same as AWS 95, phase in new SW • PDS Card Upg #2: PDS Card, DAT Tape, A/UX
M6825Z/A • AppleShare Pro 1.0 Software	M6825Z/B • AppleShare Pro 1.1 Software
	M2885Z/A • Software upgrade to AWS 95 installed base

Europe Configuration:

Current Plan AWS 95	Jan. 1994 Release AWS 95
1) M6865XX/A • 16MB Memory, 256KB L2 Cache, 500MB Disk, DAT Tape	1) M3074XX/A • 32MB Memory, 256KB L2 Cache, 2GB Disk, DAT Tape
2) M6895XX/A • 48MB Memory, 512KB L2 Cache, 230MB Disk, 1GB Disk, DAT Tape	2) M3075XX/A • 48MB Memory, 512KB L2 Cache, 250MB Disk, 2GB Disk, DAT Tape
M6940Z/A • PDS Card Upgrade #1: PDS Card and A/UX	Same as AWS 95, phase in new SW • PDS Card Upgrade #1: PDS Card and A/UX
M6945Z/A • PDS Card Upg #2: PDS Card, DAT Tape, A/UX	Same as AWS 95, phase in new SW • PDS Card Upg #2: PDS Card, DAT Tape, A/UX
M6825Z/A • AppleShare Pro 1.0 Software	M6825Z/B • AppleShare Pro 1.1 Software
	M2885Z/A • Software upgrade to AWS 95 installed base

AWS 95: Hardware Product Enhancements - Jan 1994 Release (1/94)

Revised: 12/23/93
Security: Everyone

AWS 95: Hardware Product Enhancements - Jan 1994 Release (1/94)

==========

Article Created: 5 January 1994

TOPIC ----------

This article describes hardware enhancements to the Apple Workgroup Server (AWS) 95 with the January, 1994 product announcement.

DISCUSSION ----------

1) 2GB Hard Drive
   The new drive provides double the storage capacity of existing Apple hard drives on the AWS 95 (2GB vs. 1GB), and offers faster data rates. Most AWS 95 configurations will be packaged around the new 2GB hard drive. Below is a table showing speed comparisons:

	1GB Drive	2GB Drive
Seek time (ms)	11	9
Access Time (ms)	16	12
Internal Data Rate (MB/sec.)	3	5
External Data Rate (MB/sec.)	10	10

2) New Drive Bracket/SCSI Cable
   Apple has developed a new bracket/cable solution that allows the AWS 95 to hold up to 5 internal hard drives as compared to 2 drives before. Both systems support CD-ROM or DAT tape in addition to the hard drives stated above. Users will be able to take advantage of the new expanded internal storage capability.

AWS 95: Software Product Enhancements - Jan 1994 Release (1/94)

Revised: 12/23/93
Security: Everyone

AWS 95: Software Product Enhancements - Jan 1994 Release (1/94)

==========

Article Created: 5 January 1994

TOPIC ----------

This article describes software enhancements to the Apple Workgroup Server (AWS) 95 with the January, 1994 product announcement.

DISCUSSION ----------

1) Improved AppleShare Performance
   Apple has tuned A/UX software with AppleShare Pro to provide better system throughput. Preliminary benchmarks indicate file sharing operations are about 40% faster. Sequential reads improved an average of 12%, while sequential writes improved 70%. Enumerate performance, browsing through files and directories on the server, experienced the largest gain with a 123% increase in speed.

2) Pre-install TCP/IP and NFS
   Each AWS 95 will include TCP/IP and NFS pre-installed on the hard drive. UNIX customers asked that Apple make this software easier to setup, so we are loading it on the hard drive and allowing customers to select TCP/IP and NFS as an option.

3) Software Enhancements and Fixes
   Apple has tuned AWS 95 system software and made critical fixes. The key enhancements are listed below. These software improvements will be available to the installed based through a charge for software upgrade, check the Apple Price List for prices. Users who purchase an AWS 95 in December 1993, January 1994, or February 1994 will receive a software upgrade free of charge. Users will be required t prove that they purchased the AWS 95 in December, January, or February with an invoice.

Performance Improvements

- The file server now caches the packed data returned in enumerate calls, which improves browsing performance on the server.

- The file server no longer flushes the entire 68040 cache for local I/O.
- Rewrote the UNIX Ethernet driver and AppleTalk stacks to increase performance, primarily writes.
- Removed bottlenecks from the A/UX File Manager to speed up Finder copies.

Other Enhancements

- Support added for "dynamic" use of removable hard drives, such as Syquest drives.
- Added support for new Apple Twisted-Pair Ethernet card.
- Installed StyleWriter II print driver and new version of the Chooser.
- Installed new version of LaserWriter driver for LaserWriter NTR.
- Support for UNIX filesystems up to 4 GB (AppleShare still limited to 2 GB).

AppleShare Pro Fixes

- "Shortname" for CD-ROMs that have a ';' in the volume or path name will now be correct.
- The file server no longer returns fnfError when parsing a shortname path when the shortname not yet derived.
- Corrected a timing condition during startup which caused the stack to remain uninitialized and AppleShare to crash.
- Clients now derive the correct sub-folder count when they don't have full privileges on the parent folder.
- Improved error checking for GetIcon, AddIcon and GetAPPL calls.
- Fixed a hang in the parsing code when parsing shortnames and a btree call completed asynchronously.
- You should now be able to umount(1m) a UNIX filesystem after unsharing via Admin.
- Enumerates are now counted as file server activity; previously, this was not done and could cause a client to be logged out when opening up a folder containing many items.

A/UX Kernel Fixes

In the Protocol Stacks and Network Interfaces
- Infrequently, AppleShare Pro servers would not show up in the Chooser on some clients; this has been corrected.
- NFS clients with more than eight active supplementary groups could cause an AWS 95 to crash; the system no longer crashes, but will recognize only the first eight group IDs.
- ifconfig ae6 down no longer causes the system to crash.
- Previously, when using A/UX as a NFS client, you couldn't interrupt an NFS server, even if the remote filesystem was mounted with the intr option. This has been fixed.
- The AWS 95 no longer complains about duplicate IP addresses when IP is disabled.

In the UNIX Filesystem
- Fixed several problems where heavy UNIX filesystem use could cause system or process deadlock/panics.
- The buffer cache code could hold locks too long and cause interrupts to

be lost and therefore, the system tick count could drift. This has been fixed.

Other A/UX Kernel Fixes

- The MTIOCGET ioctl now returns EINVAL for non-tape devices.

A/UX Macintosh Environment Fixes

In the A/UX File Manager

- Previously, the .fs_cache file size was limited to 32MB, causing loss of Finder info with filesystems containing more than about 160,000 items. This problem was documented in the AWS Tech Note #17. It has been fixed.
- The toolbox now detects the death of catsearchd; previously, this condition could cause the entire Mac environment to hang.
- Fixed a problem in the File Manager which prevented changing the case of a filename which contained a slash ('/').
- Files with both CR and LF are now considered DOS TEXT files; previously these were interpreted as UNIX binaries.
- Previously, the Finder would frequently terminate after rebuilding the desktop. This has been fixed.
- Aliases to UNIX symbolic links now resolve to the target, not the sym-link.
- You can now subscribe to a publisher with '/', slash, in its filename.
- PB(H)Rename now correctly renames a locked file on an UFS volume.
- Previously, PBOpen did not always set the ioRefNum properly; this has been fixed.
- The A/UX Toolbox now supports the FlushCacheRange trap.
- HRename now works properly.

Related to Retrospect

- Loss of communication with a Retrospect Remote client no longer causes the Macintosh environment to freeze or hang.
- The Time low-memory global will no longer be corrupted (this fixes the Retrospect 2016 date error).
- Files with an empty resource fork are now restored correctly by Retrospect.

Related to Compatibility with Other Applications

- Think C now runs under A/UX.
- An application may now set the serial port baud rate directly via Control.
- Previously, Photoshop would crash with a disk error when creating files bigger than the available free space on the volume. Calls to SetEOF now properly check for free space.
- If the Finder restarts with files in the "Temporary Items" folder, it will now properly move them to "Recovered Items". Previously, this would not occur and creation of a new "Temporary Items" folder could fail, causing some programs, such as AppleSearch, to start up improperly.
- In the A/UX MacTCP glue, the UDP interfaces were fixed so that UDP Chat now works.

Apple Ethernet LC and LC Twisted-Pair Card Descriptions (1/94)

Revised: 12/23/93
Security: Everyone

Apple Ethernet LC and LC Twisted-Pair Card Descriptions (1/94)

==========

Article Created: 5 January 1994

TOPIC ----------

This article describes the Apple Ethernet LC Card and the Apple Ethernet LC Twisted-Pair Card.

DISCUSSION ----------

The Apple Ethernet LC Cards (Apple Ethernet LC Card and Apple Ethernet LC Twisted-Pair Card) provide all Macintosh LC models, as well as the Macintosh Color Classic and Macintosh Quadra 605 computers, with the ideal Ethernet connectivity solution for all of your networking needs.

Offering affordable high performance and flexibility, the Apple Ethernet LC Card includes a built-in Ethernet port. By plugging the appropriate Apple Ethernet cable system media adapter into this port, you can connect adapt to any standard Ethernet cabling environment: thin coax Ethernet networks, using the Apple Thin Coax Transceiver; and thick coax or other media (such as fiber-optic cable) Ethernet networks, using the Apple Ethernet AUI adapter.

The Apple Ethernet LC Twisted-Pair Card also provides cost-effective performance—as well as exceptional reliability—through its built-in, industry-standard 10Base-T network port. When used in conjunction with unshielded twisted-pair cable and an IEEE-compatible hub, it allows you to connect to IEEE 802.3 10Base-T networks.

These convenient, easy-to-install cards feature uncompromised network performance, and afford the flexibility of connection to any standard Ethernet media. They support a variety of networking protocols, including AppleTalk, TCP/IP, Mac IPX, and DECnet, and offer seamless interoperability in multivendor environments.

Features

Ease of use
- Easy, one button software installation makes set-up quick and painless
- Ships with multi-lingual software - ready for use with different language versions of system software

Compatibility
- Works with all Macintosh LC models as well as the Macintosh Color Classic and Macintosh Quadra 605 computers
- Complies with IEEE 802.3 standards
- Supports a variety of popular networking protocols, including AppleTalk, TCP/IP, Mac IPX, OSI and DECnet
- Easily integrates into multivendor environments
- Adapts to any standard Ethernet cable environment using the appropriate Ethernet cable system media adapter (Ethernet LC Card)

High performance
- Allows concurrent execution of multiple networking protocols to optimize network performance
- Ships with new, re-engineered, high performance network software
- Offers the highest available network buffer memory

Convenience
- Makes it easy to administer and expand your network. troubleshoot the network,
- Lets you take advantage of existing unshielded twisted-pair cabling (Ethernet LC Twisted-Pair Card)

Reliability
- Offers high network reliability because of the point-to-point nature of 10Base-T networks (Ethernet LC Twisted-Pair Card)

Ordering Information

Apple Ethernet LC Card

Apple Ethernet LC & LC Twisted-Pair Cards Specifications (1/94)

Revised: 12/23/93
Security: Everyone

Apple Ethernet LC & LC Twisted-Pair Cards Specifications (1/94)

==========

Article Created: 5 January 1994

TOPIC ----------

This article provides the specifications for the Apple Ethernet LC Card and the Apple Ethernet LC Twisted-Pair Card.

DISCUSSION ----------

Apple Ethernet LC Card

Connector
• Apple Ethernet

Transmit/receive data rate
• 10-megabit-per-second maximum data rate

Environmental requirements
• Operating temperature: 50° to 104° F (10° to 40° C)
• Humidity: 20% to 95% noncondensing

Power dissipation
• 4 W or less

Ethernet controller
• National Semiconductor DP83932 -SONIC

System requirements
• One available Macintosh LC–compatible processor-direct slot
• Appropriate Apple Ethernet cable system media adapter

Apple Ethernet LC Twisted-Pair Card

Connector
• Ethernet 10Base-T compliant RJ-45 port

Transmit/receive data rate
• 10-megabit-per-second maximum data rate

Environmental requirements
• Operating temperature: 50° to 104° F (10° to 40° C)
• Humidity: 20% to 95% noncondensing

Power dissipation
• Maximum 1.5, average 1 W

Ethernet controller
• National Semiconductor DP83934 -SONIC-T

System requirements
• One available Macintosh LC–compatible processor-direct slot
• Unshielded twisted-pair cable
• IEEE 802.3-compatible 10Base-T hub

Apple Personal LaserWriter 320: Description (10/96)

Revised: 10/22/96
Security: Everyone

Apple Personal LaserWriter 320: Description (10/96)

==========

Article Created: 20 December 1993
Article Reviewed/Updated: 22 October 1996

TOPIC ----------

This article describes the Apple Personal LaserWriter 320.

DISCUSSION ----------

The Apple Personal LaserWriter 320 is an affordable PostScript laser printer that offers a number of advanced print capabilities. It's ideal for individual home, education, and small-business users who require PostScript capability and who desire future RAM expansion options.

As easy to own as it is to buy, the Personal LaserWriter 320 connects simply, via the Macintosh computer's built-in LocalTalk port, and features an attractive, compact design. It also provides state-of-the-art energy efficiency. There is no on/off switch; instead, the printer "wakes up" when needed, operating the remainder of the time in an electricity-saving—and completely silent—standby mode.

Yet for all its simplicity of setup and operation, the Personal LaserWriter 320 offers a host of advanced capabilities. It features outstanding print quality, uniting Adobe PostScript Level 2 with Apple's own FinePrint resolution-enhancement technology. And the Personal LaserWriter 320 comes with 35 fonts in ROM, as well as built-in TrueType scaling for the highest-quality printing when using either PostScript Type 1 or TrueType fonts.

As your printing needs become more sophisticated, the Personal LaserWriter 320 is designed to grow to meet them. It has two expansion options: the 2MB RAM Upgrade, which expands both the printer's memory cache and its ability to print documents that contain large numbers of downloadable fonts; and the 6MB RAM PhotoGrade Upgrade, which adds to those capabilities the enhanced graphic image quality provided by Apple's PhotoGrade technology. Simply put, the Personal LaserWriter 320 offers the PostScript printing capabilities you need—now and in the future.

Features

Outstanding print quality

- Offers 300-dpi resolution
- Combines Adobe PostScript Level 2 support with FinePrint technology for resolution enhancement
- Comes with 35 built-in fonts and the TrueType scaler in ROM
- Includes built-in support for PhotoGrade graphic image enhancement (requires optional RAM upgrade)

Ease of ownership

- Connects simply via the Macintosh computer's built-in LocalTalk port
- Complies with the EPA's Energy Star guidelines for energy-efficient operation
- Prints extremely quietly, and makes no noise at all when not in use
- Features a compact, attractive design

Affordability and expandability

- Provides advanced functionality at an affordable price
- Offers two expansion options, allowing you to enhance its capabilities as your needs grow

Apple Personal LaserWriter 320: Technical Specifications (6/96)

==========

Article Created: 17 December 1993
Article Reviewed/Updated: 6 June 1996

TOPIC -----

This article gives the technical specifications for the Apple Personal LaserWriter 320.

DISCUSSION -----

Print engine and controller

True laser engine
AMD 29205 RISC processor

Print quality

300-dpi resolution
FinePrint, Apple's resolution enhancement technology
PhotoGrade, Apple's graphic image enhancement technology

Memory

2MB of RAM standard
Expandable to 4MB or 8MB with optional upgrades

Interface

LocalTalk port

Print speed

Four-pages-per-minute maximum (actual speed varies depending on images printed and computer used)

System requirements

Any Apple Macintosh personal computer
System software version 7.0 or later
4MB of RAM or more recommended

Fonts

35 fonts from the following font families: Courier, Helvetica, Helvetica Narrow, ITC Avant Garde Gothic, ITC Bookman, ITC Zapf Chancery, ITC Zapf Dingbats, New Century Schoolbook, Palatino, Symbol, and Times

The four Apple fonts: Chicago, Geneva, Monaco, and New York

Paper capacities

Standard
- Manual feed tray
- 100-sheet Universal cassette

Printable Area

Maximum printable line: 8-in. (203 mm)
Minimum top margin: .11-in.
Mininum bottom margin:.21 -in.
Minimum left margin: .13-in.
Minimum right margin: .17 -in.

Note:

The Personal LaserWriter 320 requires 4 MB of RAM to print to the minimum margins on U.S. legal paper.

Paper Sizes

Width:	Minimum - 90mm	(3.54 in)	Maximum - 216mm (8.5 in)
Length:	Minimum - 188mm	(7.40 in)	Maximum - 356mm (14.0 in)

Print materials

16- to 28-lb. (60 to 105 g/m2) bond
Paper: U.S. letter, U.S. legal, A4, executive

Most letterhead and colored stock, labels, and envelopes

Medium-weight photocopier transparencies

Power requirements

U.S./Japan: 100 to 115 V, 50 to 60 Hz
Europe/Australia: 220 to 240 V, 50 Hz

Power consumption

```
-----------------
Operating mode: 120 W average
Standby mode: <10 W

Environmental requirements
--------------------------
Temperature: 50 to 90 deg. F (10 to 32 deg. C)
Humidity: 20% to 80% noncondensing
Toner cartridge transit environment: –4 to 104 deg. F (–20 to 40 deg. C)

Size and weight
---------------
Height: 6.3 in. (16.1 cm)
Width: 15.2 in. (38.5 cm)
Depth: 14.9 in. (37.9 cm)
Weight: 15.4 lb. (7 kg) not including cartridge

Apple Media Authoring System: Hardware Specs (1/94)

Revised: 1/11/94
Security: Everyone

Apple Media Authoring System: Hardware Specs (1/94)

==========

Article Created: 22 December 1994

TOPIC ----------

This article gives the hardware specifications for third party products bundles with the Apple Media Authoring System.

DISCUSSION ----------

HARDWARE SPECIFICATIONS

AppleDesign Powered Speakers

- Full-range, tuned-port base-reflex system
- Active equalization for best frequency response at all listening levels
- Focused sonic dispersion for optimum personal listening
- Noise-reduction circuitry for audio clarity
- Built-in dual-input mixer and dual-channel amplifier

SuperMac DigitalFilm Card

- Video capture:
  Variable up to 640H
  Variable up to 480V
- Print to tape and display:
  NTSC—60 fields per second at 640 x 480 pixels
  PAL—50 fields per second at 786 x 576 pixels
- 24-bit graphics with Thunder QuickDraw acceleration on up to 832 x 624 pixel displays
- Audio capture: Stereo input and output at 8-bit resolution with audio sample up to 44.1kHz

SuperMac ThunderStorm Card

- Dual programmable DSPs optimized for image processing acceleration
- 60 MIPS performance

SYSTEM CONTENTS

AppleDesign Powered Speakers

- Powered speaker and satellite speaker
- Power-supply module (120-V input)
- Computer-to-speaker cable (with 3.5-mm miniplugs)
- CD-stereo cable with RCA jacks
- Speaker-to-speaker cable
- Complete documentation
- Limited warranty

SuperMac DigitalFilm Card

- Single NuBus slot card
- Breakout box for external video and audio connections
- Two sets of audio and video cables
- DigitalFilm software version 1.5
- Documentation
- Limited warranty

SuperMac ThunderStorm Card

- Single NuBus slot card
- Plug-in filter module
- Documentation
- Limited warranty

SOFTWARE:
All the third party software products listed below include:
- Software on CD-ROM disc
- Documentation
- Limited warranty statement

Adobe Premiere Deluxe CD-ROM Edition
Adobe Photoshop Deluxe CD-ROM Edition
Macromedia Action
Macromedia Sound Edit Pro
Media Clips

All the third party software products listed below include:
- Software on floppy disks
- Documentation
- Limited warranty statement

Apple Media Tool
CoSA After Effects
Macromedia Director
Macromedia MacroModel
Kodak Shoebox

NOTE:

Apple assumes no responsibility with regard to the performance or use of non-Apple products. All understandings, agreements, and warranties, if any, take place directly between the vendors and the prospective users. Product specifications are subject to change without notice.

Apple Media Authoring System: Description (1/94)

Revised: 5/7/96
Security: Everyone

Apple Media Authoring System: Description (1/94)

==========

Article Created: 22 December 1994

TOPIC ----------

This article describes the Apple Media Authoring System.

DISCUSSION ----------

Apple presents the state-of-the-art desktop multimedia development solution: The Apple Media Authoring System. This system contains the essential hardware and software tools required for media authoring, integration, and production. From three-dimensional modeling to animation, from special video effects to object-oriented authoring, this system includes the software and hardware you need to create titles, on-line presentations, video kiosks, and games.

This Apple-designed system is intended for use with your choice of high-performance Macintosh Quadra computers (800, 840AV, 950). These computers provide expandable, high-speed platforms for multimedia authors and developers. AppleDesign Powered Speakers, included in this solution, equip the Quadras with CD-quality near-field stereo output.

DigitalFilm and ThunderStorm from SuperMac add the tools you need to go from concept, through production to mastering the video and audio portions of your CD-ROM. DigitalFilm adds capture capabilities for full-motion video and audio. The ThunderStorm image processing card accelerates the application filters in Adobe Premiere and Photoshop as well as in CoSA After Effects. Together these tools accelerate the process and generation of you final media productions, including Cinepak movies.

The system includes a complete suite of software programs: Adobe Photoshop, the industry-standard software for image manipulation and photo retouching; Adobe Premiere, a digital movie-making and video production tool; Apple Media Tool, object-oriented authoring software

for rapid prototyping without programming and cross platform playback; CoSA After Effects for advanced digital compositing and effects; Macromedia Macromodel for 3D modeling, Macromedia Director integrates animation, sound, QuickTime movies, and interactivity; Macromedia Action! with ClipMedia, for producing multimedia presentations; Macromedia Sound Edit Pro for sound digitizing and editing; and Kodak Shoebox, an image database manager.

With the Apple Media Authoring System, you'll have just about everything you need to build the ultimate multimedia authoring studio.

FEATURES

AppleDesign Powered Speakers

- High-quality stereo separation and sound
- Excellent frequency response using transducer, tuned-port design and active equalization
- Built-in noise-reduction circuitry for clear sound

SuperMac DigitalFilm

- NuBus video card for full-motion, full-screen video and audio capture and editing
- Hardware-accelerated Apple Photo JPEG compatible image compression and decompression
- 24-bit accelerated graphics on up to 17-inch displays at 832 x 624 resolution

SuperMac ThunderStorm

- Nubus card accelerates multimedia filters for Adobe Premiere and Photoshop and CoSA After Effects
- Ideal for CD-ROM Cinepak video production

Apple Media Tool

- Multimedia production software allows media element assembly without programming

Adobe Premiere Deluxe CD-ROM Edition

- Digital video production and editing software allows nonlinear, off-line editing and production of QuickTime movies

Adobe Photoshop Deluxe CD-ROM Edition

- Photo manipulation, image editing, and production software

CoSA After Effects

- Video special-effects software puts production-house-quality tools

on the desktop

Macromedia Director

- Authoring software for multimedia production combines text, graphics, animation, sound and digital and analog video from different sources

Macromedia MacroModel

- Three-dimensional, spline-based modelling software allows fast creation of three-dimensional objects from two-dimensional reference objects

Macromedia Action!

- Multimedia presentation software

Macromedia Sound Edit Pro

- Software for digitizating and editing sound

Macromedia ClipMedia

- Provides video, animation, music and sound clips for your multimedia presentations

Kodak Shoebox

- Image database package for Kodak Photo CD users supports an index of multiple Photo CD discs

ORDERING INFORMATION

Apple Media Authoring System
Order No. M2699LL/A

Suggested computers:

- Macintosh Quadra 800 with 32MB of RAM, 1000MB hard disk drive, and external AppleCD 300 double-speed CD-ROM drive
- Macintosh Quadra 840AV with 32MB of RAM, 1000MB hard disk drive, and internal AppleCD 300i double-speed CD-ROM drive
- Macintosh Quadra 950 with 32MB of RAM, 1000MB hard disk drive, and external AppleCD 300 double-speed CD-ROM drive

Suggested displays:

- Apple AudioVision 14 Display
- Macintosh 16-inch Color Display
- SuperMac SuperMatch 17•T Display

- SuperMac SuperMatch SmartTouch Touch Screen
- E-Machines T16 II Display

Suggested keyboards:

- Apple Extended Keyboard II
- Apple Adjustable Keyboard

Other suggested products:

- Sony CDW-900E Write Once drive and CD-ROM Formatter Series Software from Sony Electronic Publishing
- Additional SuperMac ThunderStorm card and Cinepak Accelerator Software for Cinepak compression acceleration
- SuperMac DigitalFilm Player card
- SuperMac Cinepak Acceleration Kit
- 2GB FWB Hammer hard disk drive

Apple Professional Video Production System: Description (8/94)

Revised: 8/18/94
Security: Everyone

Apple Professional Video Production System: Description (8/94)

==========

Article Created: 20 December 1993
Article Reviewed/Updated: 18 August 1994

Topic ----------

This article describes the Apple Professional Video Production system, which brings professional video production and special effects capabilities to the desktop.

Discussion ----------

Apple presents the state-of-the-art desktop video and special effects solution: The Apple Professional Video Production System. The system delivers a high-quality digital video production studio anywhere you can put a computer. It gives CD-ROM based Macintosh Quadra class machines (800 and 950 (see note below about the 840AV)) full-screen, full-motion video capabilities without pixel doubling. And it contains everything you need to quickly and easily capture, display, edit and output professional-quality video to video tape, and also includes professional-quality stereo sound mixing and editing capabilities.

These Macintosh Quadra computers are the perfect choice for video professionals who demand speed, expandability, and high-quality video capabilities. AppleDesign Powered Speakers, included in this solution, equip the Quadras with CD-quality near-field stereo output.

These computers are complemented by VideoVision Studio, Radius' newest and most advanced JPEG video capture card. This NuBus card puts hardware compression and decompression of full-frame, full-motion digital video at your fingertips. It allows you to capture, display, edit, and output 640-by-480-pixel digital video at 30 frames and 60 fields per second.

Equipped with VideoVision Studio and a 2-gigabyte disk array, Macintosh Quadra computers have ample processing power to exercise the capabilities of the system's video-production software: Adobe Premiere and VideoFusion. These programs bring professional-quality post-production capabilities to the desktop and offer an affordable alternative to costly special-effects

hardware and outside production services.

To help create your sound tracks, the system includes digidesign's Audiomedia II 16-bit CD-quality sound card. This NuBus card puts a digital recording studio in your Macintosh. Its Sound Designer II stereo waveform-editing software makes it easy to edit and finesse sound for your videos.

The Apple Professional Video Production System. Just about everything a video producer needs. At a price just about every video producer can afford.

Features

• Radius VideoVision Studio
- Nubus video card allows video capture and editing
- Full motion, full-screen, flicker-free video at 640 x 480 resolution, at 30 frames, 60 fields per second
- Professional quality output to video tape

• Storage Dimensions Macinstor Speed Array
- External disk array provides 2 gigabytes of storage space
- Connects to high-speed macintosh processor direct slot

• digidesign Audiomedia II
- Nubus digital stereo sound card provides direct-to-disk recording, and playback
- 16-bit, 44.1 Khz And 48 Khz sample rates
- Digital and analog input and output

• AppleDesign Powered Speakers
- High-quality stereo separation and sound
- Excellent frequency response using transducer, tuned-port design and active equalization
- Built-in noise circuitry for clear sound

• Adobe Premiere Deluxe CD-ROM
- Digital video production and editing software includes non-linear, off-line editing capabilities and production of QuickTime movies
- Exports to video tape

• VideoFusion
- Special effects software combines video, graphics, and text in QuickTime movies
- Unlimited layering, field rendering and alpha channel support
- Extensive libraries of transitions, color transformations, DVE moves, 2D warps, and filters

Customer Profile

The Apple Professional Video Production System is designed for:
• Independent video producers
• Corporate marketing and PR departments responsible for producing

sales and other promotional video presentations
- Training departments
- Ad agencies
- Multimedia designers and producers
- Students and educators
- Quicktime producers

System Capabilities

The Apple Professional Video Production System includes all the hardware and software you need to:
- Capture, edit, playback and compress full-motion, full-screen digital video
- 640 X 480 NTSC at 30 frames and 60 fields/second
- 768 X 576 Pal at 50 fields/second
- Produce quick, low-cost videos for presenting new concepts
- Creating training and motivational video presentations
- Editing rough-cuts (offline editing) of high-end video for edit decision list production
- Integrating video into multimedia presentations
- Transferring multimedia presentations to video tape

Ordering Information

Apple Professional Video Production System
Order No. M2703LL/A

- Radius VideoVision Studio
- Storage Dimension 2 Gb Array
- 16-bit Sound Card
- VideoFusion (software)
- Adobe Premiere Deluxe CD-ROM Edition
- AppleDesign Powered Speakers
- AppleCD 300

Suggested Computers:

- Macintosh Quadra 800 with 32MB of RAM, 1000MB hard disk drive, and an external AppleCD 300 double-speed CD-ROM Drive.
- Macintosh Quadra 950 with 32MB of RAM, 1000MB hard disk drive, and an external AppleCD 300 double-speed CD-ROM drive.

NOTE: The Professional Video Production Solution is not compatible with the Macintosh 840AV or the Power Macintosh. The Video Production Solution bundle contains the Storage Dimensions MacinStor SpeedArray 2GB external hard drive which interfaces with the processor direct slot (PDS) on the Quadra 800 and 950. The 840AV and Power Macintosh computers do not support a disk array through PDS and are therefore incompatible with the Storage Dimensions drive.

Suggested Displays:

- Apple AudioVision 14" Display

- Apple Macintosh 16" Color Display
- Apple Macintosh 21" Color Display
- Radius Intellicolor Display/20

Suggested Keyboards:

- Apple Extended Keyboard II
- Apple Adjustable Keyboard

Article Change History:
18 Aug 1994 - Changed wording in NOTE section to show Power Macintosh as incompatible.
16 Aug 1994 - Added Power Macintosh as incompatible due to PDS disk array card.

Professional Video Production System: Hardware Specs (1/94)

==========

Article Created: 22 December 1993

TOPIC ----------

This article gives hardware specifications for third party products bundled with the Apple Professional Video Production System.

DISCUSSION ----------

HARDWARE SPECIFICATIONS

AppleDesign Powered Speakers

- Full-range, tuned-port base-reflex system
- Active equalization for best frequency response at all listening levels
- Focused sonic dispersion for optimum personal listening
- Noise-reduction circuitry for audio clarity
- Built-in dual-input mixer and dual-channel amplifier

Radius VideoVision Studio

- Compression: adaptive JPEG algorithm delivers variable compression ratios of 3:1 to 50:1.
- Capture and replay: NTSC—640 x 480 pixels at 60 fields per second, PAL—768 x 576 pixels at 50 fields per second
- Audio capture: 8-bit stereo or mono audio at 11 or 22 KHz
- Video inputs: 2 S-video and composite
- Audio inputs: 2 stereo and 1 mix
- Input formats: NTSC, PAL, and SECAM
- Output formats: NTSC and PAL

Storage Dimension 2GB array

- 4.5 to 7.5 MB/s transfer rates
- Consists of two 1GB drives in a single array

• 5.1-ms effective seek time

NOTE: The Professional Video Production Solution is not compatible with the Macintosh 840AV. The Video Production Solution bundle contains the Storage Dimensions MacinStor SpeedArray 2GB external hard drive which interfaces with the processor direct slot on the Quadra 800 and 950. The 840AV does not have a PDS slot and is therefore, incompatible with the Storage Dimensions drive.

digidesign Audiomedia II

• 16-bit, 44.1kHz and 48kHz sample rates
• Stereo analog input and output (RCA-type connectors)
• Stereo S/PDIF digital input and ouptut (RCA-type connectors)
• 10MB per minute sampling rate

SYSTEM CONTENTS

AppleDesign Powered Speakers

• Powered speaker and satellite speaker
• Power-supply module (120-V input)
• Computer-to-speaker cable with 3.5-mm miniplugs
• CD-stereo cable with RCA jacks
• Speaker-to-speaker cable
• Complete documentation
• Limited warranty

Radius VideoVision Studio

• Video interface card
• JPEG compression and decompression daughtercard
• External connector panel for external video and audio connections
• Comprehensive software controls
• Documentation
• Limited warranty

Storage Dimensions 2GB array

• 2-gigabyte disk array
• DataCannon coprocessing bus card
• Custom array software
• Documentation
• Limited warranty

digidesign AudioMedia II

• Sound card
• Waveform editing software on floppy disks
• Documentation
• Limited warranty

Adobe Premiere Deluxe CD-ROM Edition

- Software on CD-ROM disc
- Documentation
- Limited warranty

VideoFusion

- Software on floppy disks
- Documentation
- Limited warranty

NOTE:
Apple assumes no responsibility with regard to the performance or use of non-Apple products. All understandings, agreements, and warranties, if any, take place directly between the vendors and the prospective users. Product specifications are subject to change without notice.

HyperCard 2.2: Possible Post-Installation Problems (12/93)

Revised: 12/24/93
Security: Everyone

HyperCard 2.2: Possible Post-Installation Problems (12/93)

==========

Article Created: 24 December 1993

TOPIC ----------

Some users may encounter the following problems after installing HyperCard 2.2:

- They may not see the stack icons of existing stacks.
- Earlier versions of HyperCard may be launched when they double-click on a stack.
- When they double-click on a stack, they may see a message that the application program (HyperCard) could not be found. (This will happen only on systems that have never had HyperCard or the Player installed, or that have had the Desktop file rebuilt after HyperCard was deleted.)

DISCUSSION ----------

The Problem

In order to fit on an 800K floppy disk, HyperCard 2.2 is shipped as a compressed file. The HyperCard 2.2 installation procedure doesn't make the Finder aware that the application that's been installed is HyperCard and the Finder doesn't add it to the Desktop database. On systems that already had HyperCard, there is a HyperCard entry in the Desktop database, but it points to the older version. Thus when a stack is double-clicked, the older version of HyperCard is launched. Finally, systems that have never had HyperCard don't know what icons to attach to stacks.

The Fix

All you need to do to teach the Finder about the new version of HyperCard is to open the HyperCard 2.2 folder that is installed. (Few customers will have any of these problems because the first thing most of them will do after installation is look to see what is in the HyperCard 2.2 folder.) Then their stacks will find the correct HyperCard, and under System 6 their icons will show up.

Under System 7 there's another wrinkle. If System 7 sees a HyperCard stack, it will cache the appropriate icon until the Finder is restarted (restarting the computer will do this). If it sees a HyperCard stack before an entry is made in the Desktop database for HyperCard, it will use the standard document icon. Thus under System 7, if the Finder sees a stack before it knows about HyperCard, it will give all stacks the standard document icon until it is restarted. If you see this problem, open the HyperCard 2.2 folder (to show HyperCard to the finder) and then restart the computer. Note that this will only happen on systems that had no prior knowledge of HyperCard or Player or systems that had HyperCard deleted and then had their desktop files rebuilt. Unfortunately, the Finder will see the stacks in the HyperCard program folder before it gets to HyperCard, so these systems will get the icon problem and you'll have to restart your computer to fix it.

HyperCard 2.2 & Performa: If System Hangs After Install (2/94)

Revised: 2/17/94
Security: Everyone

HyperCard 2.2 & Performa: If System Hangs After Install (2/94)

==========

Article Created: 24 December 1993
Article Reviewed/Updated: 17 February 1994

TOPIC ----------

This article describes a problem with the HyperCard 2.2 Installer on Macintosh Performa systems. An incompatibility with the Performa system software sometimes causes a system to hang if you hit the Restart button at the end of the HyperCard 2.2 installation script, even though the installation was successful.

DISCUSSION ----------

To confirm that HyperCard was successfully installed, restart your computer and launch HyperCard.

HyperCard 2.2 Standalone Applications & Color (12/93)

Revised: 12/24/93
Security: Everyone

HyperCard 2.2 Standalone Applications & Color (12/93)

==========

Article Created: 24 December 1993

TOPIC --------------------

This article provides some cautions regarding the creation of standalone applications that use color.

DISCUSSION --------------------

When you first start to colorize a stack, resources are copied from the Color Tools stack into your stack. This process is not entirely completed until the stack is closed. If you save the stack as standalone application before quitting the stack, the resources won't make it into the standalone application -- and color won't work.

Be sure to allocate enough memory to the standalone app to allow it to display color. Generally, 2MB should suffice. If you're having trouble with color in standalone apps, be sure to close the stack at least once before saving it as a standalone application (most people will do this as part of the normal development process anyway), and then go to the Get Info dialog box and give the new application at least 2MB of memory.

HyperCard 2.2: Color Tools Troubleshooting (2/94)

==========

Article Created: 24 December 1993

TOPIC --------------------

People with monitors that can't display 16 or more colors can't use the Color Tools stack. On one-bit monitors, the Color Tools stack will show a card that lists its requirements, but it doesn't do this for monitors that are not in B&W mode -- so you may have problems running the stack without realizing why.

DISCUSSION --------------------

Here are the requirements for using the Color Tools stack:
- At least 2MB of RAM allocated to HyperCard
- 32-Bit QuickDraw (included as part of system software version 7.0 or later)
- A monitor capable of showing 16 or more colors or shades of gray

Also, when using Color Tools 1.0 with HyperCard 2.2, if you:
1) Choose Open Color Tools from the Color menu,
2) Before the palette is drawn, click on the desktop, and then
3) Later go back to HyperCard,
you get Color menus but no palette. The workaround is to close Color Tools and reopen it.

HyperCard 2.2: Can't Create Standalone App with 68000 (2/94)

==========

Article Created: 24 December 1993
Article Reviewed/Updated: 17 February 1994

TOPIC ----------

The standalone application builder is not supported on 68000-based Macintosh systems.

DISCUSSION ----------

This means you can't create a standalone application on Macintosh Plus, SE, Classic, Macintosh Portable, or PowerBook 100 computers.

Article Change History:
17 February 1994 - Added more Macintosh models to the Discussion.

HyperCard 2.2: Close Script Ed Before Running OSA Script (12/93)

Revised: 12/24/93
Security: Everyone

HyperCard 2.2: Close Script Ed Before Running OSA Script (12/93)

==========

Article Created: 24 December 1993

TOPIC ----------

1) I put the following AppleScript script into a HyperCard button:

```
on mouseUp
  badNews()
end mouseUp
```

2) Click the button. HyperCard complains, 'Couldn't understand "badNews".' Click script in the complaint dialog. The script window opens. Leave the script window open.

3) Select the card window by clicking on it. Click the same button again as above.

4) HyperCard complains again. Click script again. The system eventually freezes or crashes.

DISCUSSION ----------

In a nutshell, HyperCard has problems if you run an AppleScript script with a script error and then hit the script button in the resulting error dialog while the corresponding script editor window is already open. If you run into this problem, close the script editor windows before running OSA scripts.

ARA Serial Card and Serial NB Card Differences (1/94)

Revised: 1/4/94
Security: Everyone

ARA Serial Card and Serial NB Card Differences (1/94)

==========

Article Created: 3 January 1994

TOPIC -----

I have a question about the ARA 2.0 MultiPort Server. In the requirements it mentions the AppleTalk Remote Access Serial Card and RS-232 cable; is this different from the Apple Serial NB Card and the Hydra cable? If it is, will the ARA 2.0 support the Apple Serial NB Card?

DISCUSSION -----

The ARA Serial Card is the same as the Serial NB Card except for one minor difference. The resistor packs on the card have been removed so that ports 1A and 1B are configured as RS-232-C ports. If a customer is going to use an existing Serial NB card with the ARA Server they must remove the resistor packs in order to configure the card properly for operation.

Language Kits: Text Control Panel (3/95)

Revised: 3/9/95
Security: Everyone

Language Kits: Text Control Panel (3/95)

==========

Article Created: 5 January 1994
Article Reviewed/Updated: 9 March 1995

TOPIC ----------

The Text control panel does not appear to save its selection. If I change the script setting in the control panel, close it, then open it again, the setting reverts back to Roman/US. Why does it do this?

DISCUSSION ----------

The Text Control Panel comes with the Japanese Language Kit, Chinese Language Kit, or System 7.5. This control panel is for use with WorldScript II and System extensions. It provides the user with the ability to view the scripts of the various languages (alphabets, writing systems) which are installed in the system.

When opened, the Text Control Panel defaults to show System script. The menu will always be set to the System script when the user opens the control panel because the System script is their primary script (the one they use most often).

NOTE:
Changing the "Script" menu in the Text control panel does not set a script to being the active script; it simply displays the text attributes for that particular script.

When the customer is running a language kit, for example, the operating system might still be Roman. If it is, Roman would be the script that is shown in the Text control panel. If the operating system is Kanji, then the Text control panel would show Kanji rather than Roman, even though a Language Kit might be installed in the system.

Apple Personal Diagnostics: Description and Specs (2/95)

Revised: 2/7/95
Security: Everyone

Apple Personal Diagnostics: Description and Specs (2/95)

==========

Article Created: 5 January 1994
Article Reviewed/Updated: 7 February 1995

TOPIC ----------

This article describes Apple Personal Diagnostics (APD) software, and gives technical specifications for the product.

DISCUSSION ----------

Apple Personal Diagnostics (version 1.1) offers a way to diagnose and monitor the performance of your Macintosh, Power Macintosh, or PowerBook system.

This software gives you information about your computer's hardware and software. It's also the only diagnostic product available that's based on the same testing programs Apple uses in manufacturing Macintosh computers. Regular use of the program can reduce system down time, minimize support calls, and help you isolate the sources of problems.

Personal Diagnostics combines hardware testing, system profiling, disk directory repair, and software checking in one package that now supports Power Macintosh and is fully compatible with System 7.5. You can run your system through an entire set of tests just by clicking on one button, and the results are presented in clearly understandable graphics and tables. The program performs comprehensive diagnostic tests on your system’s internal components, hard drives, floppy drives, and monitors. The hardware performance tests let you compare your system with benchmarks established by Apple for other Macintosh computers.

Personal Diagnostics also provides a variety of software information and checks. It lists all applications and system files (including extensions) installed on your computer, alerts you if duplicate System folders exist, and diagnoses and repairs minor disk directory problems.

You can even have Personal Diagnostics automatically test your Macintosh system when you are not using it. It alerts you to any irregularities that may exist

and suggest simple steps to correct them before they deteriorate into more serious problems.

Features

Thorough Diagnostics

- Tests logic board, memory, and other hardware components
- Checks for damaged System, Finder, and Enabler files
- Verifies and repairs disk directories
- Runs benchmark tests for comparison with Apple standards
- Looping option assists in detecting intermittent problems.

Comprehensive System Information

- Specifies the type and speed of processor and any coprocessors
- Indicates the amount of memory available, including RAM and virtual memory
- Displays SCSI bus assignments and the contents of NuBus slots
- Lists version numbers of system software files and applications
- Includes hardware tests for Macintosh logic board, RAM/VRAM, SCSI and IDE hard disk drives, floppy disk drives, CD-ROM drives and monitors.
- Offers a comprehensive background diagnostic function (Automated System Monitor) that checks your system during periods of inactivity. Alerts you to any irregularities that may exist, and suggests simple steps to correct them before they deteriorate into more serious problems.
- Identifies duplicate System Folders and other system irregularities and provides you with simple solutions.

Ease of Use

- Runs an entire suite of tests with the click of one button
- You can customize the test suite to your needs
- Checks your system automatically during periods of inactivity (Automated Diagnostics)
- Prints customized reports quickly

Technical Specifications

Diagnostic Tests

- Logic board
  - Clock/interrupt (VIA and RTC circuitry)
  - Floating-point unit (if present)
  - Memory management unit (if present)
  - RAM
  - Parameter RAM
  - ROM
  - ADB circuitry

  - Sound output (mono and stereo)
• Hard disk drives
• Floppy disk drives
• Monitors (displays test patterns)
• Software
• Detects and repairs corrupted disk directories
• Detects damaged system files (System, Finder, and Enabler)

System Information

• Macintosh model
• Processor type and speed
• Co-processor type (if any)
• Memory addressing mode
• Virtual memory status (if available)
• Memory size (installed memory plus virtual memory)
• Keyboard type
• NuBus cards type and slot number
• SCSI/IDE device name, type, and ID number
• Floppy disk drive type
• System and Finder version numbers
• Apple Menu items, Control Panels, System/Chooser extensions,
  and applications, including version numbers whenever possible
  (startup drive only)
• Identification of multiple System Folders (if applicable)

Benchmark Checks

• Performance data for CPU, math functions, video, and hard drives
• Comparisons of your system with Apple's benchmarks for several
  popular Macintosh models
• Performance history for your computer

Automated Diagnostics

• Logic board test
• Memory test
• Hard disk drive test
• Software check

Reports

Apple Personal Diagnostics reports can be customized to provide:

• Hardware information
• Software information
• Diagnostic test results
• Benchmark results
• Automated diagnostics history

System Requirements

• Apple Macintosh Plus or later, a Power Macintosh, or PowerBook

computer with at least 2MB of RAM
- Macintosh system software version 6.0.7 or later (automated diagnostics option requires version 7.0 or later)
- Hard disk drive
- Floppy disk drive

Ordering Information

Apple Personal Diagnostics
Order No. M2800LL/B

Contents:

- One 800K application disk, and two emergency disks (for starting up your computer and repairing damaged file directories).
- User's Guide.

ISDN and Macintosh (9/94)

==========

Article Created: 4 January 1994
Article Reviewed/Updated: 27 September 1994

TOPIC --------------------

What ever happened to Apple's ISDN card? Is there any information available for using ISDN with a Macintosh?

DISCUSSION --------------------

Apple's ISDN NuBus Card is a discontinued product. The Apple ISDN card is also NOT ISDN-1 compliant.

We know of three solutions for Macintosh which are:

1) MacSnet NuBus Card distributed by OST, Inc.

2) Planet-ISDN NuBus Card by Access Privilege Products and distributed by Q.Sys International, Inc., and OST, Inc.

3) Hayes ISDN System Adapter which works in conjuction with Apple Remote Access MultiPort Server.

Alternatives are to use National ISDN-1 compliant routers like Cisco Systems, Wellfleet, Engage Communications, and others.

To locate a vendor's address and phone number, use the vendor name as a search string.

Article Change History:
27 Sep 1994 - Added the Hayes ISDN solution.

AppleShare 4.0.1 Read Me File (1/94)

Revised: 1/5/94
Security: Everyone

AppleShare 4.0.1 Read Me File (1/94)

==========

Article Created: 5 January 1994

TOPIC ----------

This article contains the AppleShare 4.0.1 Read Me.

DISCUSSION ----------

APPLESHARE 4.0.1 READ ME
==========

This document provides important information about AppleShare 4.0. Some of this information is not included in the "AppleShare 4.0 Administrator's Guide." You may want to print this document and keep it with the "AppleShare 4.0 Administrator's Guide."

Choose Screen Savers Carefully

There are many screen savers on the market that can be used to prevent screen burn-in on AppleShare servers. Some screen savers are quite elaborate and perform many complex calculations to draw a single picture on the screen. Since they require significant amounts of CPU time, the more complex screen savers will impede the performance of your AppleShare server. Please choose the screen saver that interferes the least with your AppleShare server.

Some screen savers are not compatible with AppleShare 4.0 and can cause your AppleShare file server to crash or hang. Before purchasing or using a screen saver, check with the screen saver's manufacturer to determine if the screen saver will work properly with your AppleShare file server.

Optimize Memory Usage

AppleShare 4.0 uses caching techniques to improve the performance of the file server. Caching stores frequently used items, such as folders, icons, and parts of documents, in high-speed memory. Items in memory can be retrieved faster than items stored on disk.

In general, the more you increase the size of the cache, the better your AppleShare File Server will perform. However, increasing the size of the cache also increases the amount of server memory your AppleShare File Server requires. If you increase the size of the cache by too much, your other server applications (such as AppleShare Print Server) may not be able to run in the remaining memory.

To be sure that all your server applications have enough memory to operate correctly, start AppleShare File Service after you have opened all your other server applications. If there is not enough memory to start AppleShare File Service with the cache size you requested, AppleShare File Service will decrease the size of the cache until it fits in the available memory.

If, however, the primary purpose of your server system is to provide AppleShare File Service, then you may want to start AppleShare File Service first. This will allow AppleShare to allocate all the memory it needs. You can then use the remaining memory for your other server applications.

If you are using a backup utility that periodically backs up your file server data, be sure to leave enough memory available for the backup utility to function properly.

Using System 7 Disk Cache with AppleShare 4.0

In addition to the caching provided in AppleShare 4.0, System 7 also provides disk caching. Depending on how you use AppleShare 4.0, you may notice an improvement in performance by adjusting the server computer's disk cache size. Cache sizes in the range 32K to 128K are valid settings for use with AppleShare. Settings higher than 128K will provide little additional improvement in performance and will waste memory. In general, increasing the size of the cache for your AppleShare File Server will provide a more substantial performance improvement than increasing the size of the System 7 disk cache.

System 7 ships with disk cache turned on and set to 32K. You may wish to experiment with higher settings. (You adjust the cache size in the Memory control panel.) Depending on the type of server usage in your work environment, you may notice better server performance.

If you change the size of the disk cache, be sure to restart the server computer for the new size to take effect.

Using Virtual Memory with AppleShare 4.0

It is possible to run AppleShare 4.0 software with virtual memory turned on; however, doing so is not recommended. If you choose to run the software with virtual memory turned on, you will likely notice a decrease in server performance. See the manuals that came with your server computer for more information on using virtual memory.

Using Special Characters in Server Names

AppleShare 4.0 Admin will not allow the administrator to enter a server name that contains a "/" character. If you must have a "/" character in the name of your server, use the following workaround:

1. Shut down file service.
2. Quit AppleShare Admin.
3. Drag the Users & Groups Data File from the Preferences folder to the System Folder.
4. Using the Sharing Setup Control Panel, change the Macintosh name to the Server name you want.
5. Start AppleShare Admin.
6. Fill out the information in the Administrator Information and Serial Number dialog box.
7. When the Server Name dialog box appears, do not touch the Server Name field. Just enter the Admin Key and click OK.
8. Quit AppleShare Admin.
9. Drag the Users & Groups Data File from the System Folder to the Trash. It is no longer needed.

Retaining Access Privileges while Upgrading from Macintosh File Sharing

If you are upgrading from Macintosh file sharing while using new server hardware, your original access privileges will not be retained in some circumstances. Specifically, if you copy information from the startup volume using the Finder, your access privileges for that volume will not be retained. The "AppleShare 4.0 Administrator's Guide" instructs you how to manually re-establish those access privileges on the new server. For startup volumes that have only a few sharepoints and only a limited number of folders with specific access privileges, this is the best approach. However, if your startup volume has many folders with different access privileges, then you may want to use the following workaround.

Follow the instructions in the "AppleShare 4.0 Administrator's Guide" for upgrading from Macintosh file sharing. When the instructions ask you to copy the data from the startup volume, use the instructions below instead. Then finish the rest of the instructions in the "AppleShare 4.0 Administrator's Guide."

1. Connect an empty (unused) external disk to your old system.

2. Copy AppleShare Admin from your AppleShare 4.0 Installer disk to your startup volume. AppleShare Admin is in the AppleShare File Server folder. If the disk is a CD, the AppleShare File Server folder is inside the AppleShare folder.
3. Open AppleShare Admin. The "Users & Groups Data File was not found" dialog box appears.
4. Select "Use System 7 ...", and Click OK
5. Enter a serial number in the Administrator Information and Serial Number dialog box.
6. Enter a server name and admin key in the Server Information dialog box.
7. Wait for Admin to finish starting up.
8. Use the Copy <item> command to copy the contents of your startup volume to the external disk.
9. Quit AppleShare Admin, and drag it to the Trash.
10. Drag the newly created Users & Groups Data File from the Preferences folder to the Trash.
11. Drag the old Users & Groups Data File from the floppy (where you saved it earlier) to the Preferences folder.
12. Attach the external disk to your new server.

AppleShare Admin 4.0 runs only on 68040 based systems. If you are running Macintosh file sharing on other than a 68040 system, use either AppleShare Admin 3.0 or a third-party backup program to copy your startup volume. Contact your Apple Support Representative for assistance.

Install Fonts Before Using Online Documentation

If you purchased AppleShare 4.0 on a CD, online documentation for the "AppleShare 4.0 Administrator's Guide" and "Macintosh Basics" is included on the CD. Before you can use the documentation, you must first install the fonts required by DocViewer into your system. Those fonts are on your CD in the "Apple DocViewer Fonts" folder, which is in the "Apple DocViewer v1.0" folder. You can install the required fonts into your system by dragging their icons into the Fonts folder, which is in the System Folder. Some DocViewer fonts may already be in your Fonts folder. Drag only those fonts that are missing from your Fonts folder.

Use Caution when Removing the Workstation

The Installer will allow you to remove AppleShare 4.0 software as well as install it. Be aware that removing the Workstation software requires you to restart your Macintosh computer. Restarting your Macintosh computer will break your connection with your AppleShare File Server. Since there is no longer any Workstation software on your Macintosh computer, you will be unable to reconnect to your AppleShare File Server. You will need to reinstall the Workstation software from the "AppleShare Workstation" floppy disk before you can reconnect to your AppleShare File Server.

Install System 7.1 First

Always install System 7.1 first, then install AppleShare 4.0. If you install System 7.1 after you install AppleShare 4.0, the Apple Shared Library Manager will not function correctly. Since AppleShare 4.0 uses the Apple Shared Library Manager, it will also not function correctly.

If you need to reinstall System 7.1 for any reason, always reinstall AppleShare 4.0 afterwards.

Use Separate Aliases for Sharepoints

Aliases to shared folders can be created by the AppleShare server (using the Finder). Those aliases can be shared with workstations by placing them in a shared folder. If a shared alias is used by a workstation, the alias may be modified in such a way that it is no longer usable by the Finder on the AppleShare server. This can only happen with sharepoint aliases created on an AppleShare server.

To avoid this problem, use separate aliases for sharepoints. Create two aliases to the same sharepoint, using the Finder on the AppleShare server. Place one alias in a shared folder for use by workstations. Keep the other alias in a folder that is not shared with workstations.

Serial Numbers are Not Updated Immediately

Using AppleShare Admin, you can change serial numbers while file service is running. However, the old serial number will remain in effect until you restart file service.

If you change serial numbers to eliminate a duplicate serial number, you will continue to receive duplicate serial number notifications until you restart file service. Likewise, if you accidentally change the serial number to one that is already in use by another file server, you will not receive duplicate serial number notifications until you restart file service.

In addition, once you change to a new serial number, the old serial number will no longer be displayed by AppleShare Admin. To avoid confusion about which serial number is in use, restart file service immediately after changing the serial number.

Some Greeting Messages may not Appear on System 7 Workstations

Your Macintosh system software includes an AppleShare Workstation. You can use that software to log on to and use any AppleShare server, including an

AppleShare 4.0 server. However, the AppleShare Workstation software supplied with system software does not accept the full range of Server greeting messages that can be sent from an AppleShare 4.0 server.

To insure that the full range of greeting messages are displayed on all workstations, use the AppleShare Workstation software included with your AppleShare 4.0 software. See your "AppleShare 4.0 Administrator's Guide" for how to install the Workstation software.

Working with a Large Users & Groups Data File

AppleShare Admin is factory configured to work with a Users & Groups Data File that has a maximum of 1900 users. If you have a large user community, you may need to increase the capacity of AppleShare Admin. You can increase the capacity of AppleShare Admin by increasing the preferred memory size in the Admin's Info Window. (Use the Finder to first select the AppleShare Admin icon, then choose Get Info from the File menu.) AppleShare Admin needs a minimum of 400k of memory. Increase Admin's preferred memory size by 100k for each additional 1000 users in your user community. For example, AppleShare Admin needs 500k of memory to handle 2900 users. Likewise, it needs 600k of memory to handle 3900 users.

Using Retrospect with AppleShare 4.0

If you are backing up a large number of files, you may need to give Retrospect more application memory. See your Retrospect User's Guide for guidelines on when to increase the size of your Retrospect application. The Read Me document included with your Retrospect software also contains pertinent information about the use of Retrospect.

Using MicroSoft Mail Client Software on Your Server

If you are using MicroSoft Mail client software on your AppleShare server, use these directions for installing your MicroSoft Mail software:

1. On your server computer, turn AppleTalk off. (Open the Chooser, then select the AppleTalk Inactive radio button)
2. Follow the instructions included in your documentation for installing MicroSoft Mail in low memory conditions. Specifically, use the drag and drop instructions described in the Read Me document included with your MicroSoft Mail software.
3. Drag and drop all the MicroSoft Mail files in their proper location except the AppleTalk files. Those files should not be installed on your server system.
4. Reboot your server system.

Capitalize Apple II Sharepoints

If you are experiencing problems moving files between your AppleShare File Server and your Apple II workstation, try capitalizing the name of the sharepoint. For example, use a sharepoint named ARTCLASS rather than ArtClass.

Use QuickTime 1.6.1 on Workstations

If you are using NOW utilities on your workstation, and also have QuickTime 1.6 on your workstation, your workstation may hang when logging on to an AppleShare File Server. This may occur when logging on to a server through either the chooser, or through an alias. To correct this problem, install QuickTime 1.6.1 on your workstation. Alternatively, removing QuickTime 1.6 or the NOW utilities from your workstation will also fix the problem. You may also experience problems if you are using the HAM (HierArchial Menu) utility.

If you received AppleShare 4.0 on a CD, QuickTime 1.6.1 is inside the "Extras" folder, which is in the "AppleShare Tidbits" folder on the CD. If you received AppleShare 4.0 on floppy disk, QuickTime 1.6.1 is inside the "Extras" folder on the floppy disk labeled "AppleShare Tidbits".

Using the Apple IIe or the IIe Card for the Macintosh LC

If you are experiencing problems logging on to an AppleShare 4.0 File Server from either an Apple IIe or a Macintosh LC with a IIe card, contact your Apple support representative. Ask your representative to supply you with the upgraded software required to fix the problem.

Use the International Menu to Choose the Roman Keyboard

Using KanjiTalk 7.1, there are two ways to select the Roman keyboard. You can use either the international menu or the keyboard palette. When entering the product serial number into the File Server Serial Number Preferences dialog, use the international menu to select the Roman keyboard rather than the keyboard palette. The keyboard palette does not work correctly.

Specifically, before you open AppleShare Admin for the first time, use the international menu to select the Roman keyboard. Afterwards, open AppleShare Admin and enter the serial number into the File Server Serial Number Preferences dialog.

If you need to change your serial number, remember to select the Roman keyboard before selecting File Server Serial Number Preferences from the

Server menu.

Logging on to an AppleShare File Server from a PhoneNet PC Client

Using AppleShare Admin, you can force new AppleShare users to change their password the first time they log on to your server. If new users are experiencing problems logging on to an AppleShare File Server with PhoneNet PC, try letting the user keep the original password.

Modifying Users & Groups Information on a Server that also has Apple Remote Access

If you install AppleShare on a server that also has Apple Remote Access, the ability to work with Users and Groups from Apple Remote Access is disabled. Instead, use AppleShare Admin to work with Users and Groups.

Avoid Giving Users Access to the Root of a Volume

Using AppleShare Admin, you can give workstation users access to either the root of a volume, or to sharepoints within that volume. To insure the security of your file server, give workstation users access to sharepoints only.

Opening Applications over the Network

If you are experiencing problems opening applications over the network from your AppleShare File Server, and your workstation is a 68040 based Macintosh, try installing "Network Launch Fix" into the Extensions folder of your workstation.

If you received AppleShare 4.0 on CD, "Network Launch Fix" is inside the "Extras" folder, which is in the "AppleShare Tidbits" folder on the CD. If you received AppleShare 4.0 on floppy disk, "Network Launch Fix" is inside the "Extras" folder on the floppy disk labeled "AppleShare Tidbits". If you received AppleShare Tune-Up 4.0.1, "Network Launch Fix" is inside the "Extras" folder on the floppy disk labeled "AppleShare Tune-Up 4.0.1".

Using Quadra 605's or LC 475's as File Servers

If you are experiencing problems using a Quadra 605 or an LC 475 as a file server, try setting the server monitor to black & white. Open the Monitors control panel and select "Grays: Black & White."

AppleShare 4.0.1 Tune-Up (5/96)

Revised: 5/24/96
Security: Everyone

AppleShare 4.0.1 Tune-Up (5/96)

==========

Article Created: 5 January 1994
Article Reviewed/Updated: 24 May 1996

TOPIC ----------

This article describes AppleShare 4.0.1 Tune-Up's enhancements, and how to obtain it.

DISCUSSION ----------

On January 4th, Apple announced AppleShare 4.0.1, a follow-on to the AppleShare 4.0 software that was released in July 1993. AppleShare 4.0.1 is a Tune-Up release only and the technology is free to all owners of AppleShare 4.0. The Tune-Up installer will upgrade any AppleShare 4.0 server to version 4.0.1. There is one worldwide version of the Tune-Up that upgrades English, French, Spanish, Italian, and Dutch versions of AppleShare 4.0 to version 4.0.1.

AppleShare 4.0.1 has the following features and enhancements that were not part of AppleShare 4.0:

- Supports all 68040 computers except the Centris/Quadra 660AV and Quadra 840AV.
- Utilizes Apple Shared Library Manager (ASLM) 1.1 and is therefore compatible with Apple Remote Access MultiPort Server and Apple Internet Router 3.0.1.
- Fixes all known compatibility problems with Farallon's PhoneNET PC.
- Fixes all know compatibility problems with PowerTalk and PowerShare Collaboration Servers.
- Updates the Apple Internet Router 3.0 to version 3.0.1 if it is resident on the AppleShare 4.0 server computer.

NOTE: Customers must also install the Network Software Installer ZM-1.4.1 or later.

AppleShare Tune-Up 4.0.1 is available free of charge in the USA in the following

ways:

• Call the Apple Order Center. The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

NOTE: There is a shipping/handling fee for each order. All components needed to perform the upgrade are included in this kit. NO proof of purchase is required. The program will run from 1-4-94 to 5-31-94. Shipments will be made via first class mail within the 50 states and District of Columbia.

• These articles can help you locate software updates mentioned here:

- "Where To Find Apple Software Updates"
  Lists online services for "free" Apple software updates.

- "Obtaining Apple Product Support in the USA"
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Article Change History:
24 May 1996 - Updated for technical accuracy.
12 Jul 1994 - Updated information on how to obtain Apple Software updates.

AIR 3.0.1 Basic Connectivity Package Read Me (1/94)

Revised: 1/5/94
Security: Everyone

AIR 3.0.1 Basic Connectivity Package Read Me (1/94)

==========

Article Created: 5 January 1994

TOPIC --------------------

This article contains the Apple Internet Router (AIR) 3.0.1 Basic Connectivity Package Read Me.

DISCUSSION --------------------

Apple Internet Router 3.0.1 Basic Connectivity Package Read Me

Version 3.0.1 Bug Fixes

- An incompatibility between the SNMP Router Agent and Shared Library Manager 1.1 has been fixed.

- An incompatibility between the DialUp access method and Apple Remote Access has been fixed.

Customized Installations

- The Customize installation screen differs from the one shown in Chapter 2 of the "Apple Internet Router Administrator's Guide." The following additional items appear when you click Customize during the installation process:

  "AppleTalk v58.0 for System 7" — Select this item if you do not already have AppleTalk version 58.0 or later installed on your Macintosh.

  "Half-Routing Resources" — Select this item if you do not already have AppleTalk Remote Access or Apple Remote Access installed on your Macintosh.

- If you are doing a customized installation of the router, be sure to install AppleTalk version 58.0 unless you already have a later version installed.

Using Memory Efficiently

- To ensure that the router has sufficient memory, you should start the router before starting other application programs (including file or print servers).

- When the router fails to start because it does not have enough memory, you may see an on-screen message that does not necessarily indicate that insufficient memory is the problem. For instance, you may see the message "The router was unable to start because an error occurred while installing an AppleTalk connection driver for a configured port."

  The Apple Internet Router requires a Macintosh computer with at least 4 megabytes of memory installed. To run other applications concurrently, you may need to install more memory in the router Macintosh.

- If you install System 7.1 and do not reinstall the router, you may get a message indicating that there is not enough memory for the router to start. You must reinstall the router software after installing System 7.1.

Upgrading from Version 2.0 of the AppleTalk Internet Router

- The message "Version 2.0 of the Router can not run. It is no longer installed." appears whenever you restart the router Macintosh if version 2.0 of the AppleTalk Internet Router was running on the Macintosh computer on which you installed the Apple Internet Router Basic Connectivity Package and you did not do the following prior to the installation:

  1. Open the Router desk accessory by choosing Router from the Apple menu.

  2. If necessary, open the Router Setup window by choosing Router Setup from the Router menu.

  3. Click the Current Status Off button to stop the Router.

  4. Click the Restart Status Off button to prevent the Router from starting when you start up the router Macintosh.

  5. Close the Router Setup window.

  6. Click Yes to save your changes to the Router Setup.

Though version 2.0 of the AppleTalk Internet Router cannot run, the newly installed Apple Internet Router will function properly.

To prevent this message from appearing whenever you restart the router Macintosh, start the router Macintosh using a startup disk on which version 2.0 of the AppleTalk Internet Router is installed, then follow the preceding steps. Once you've set the router's restart status to Off, the message no longer appears.

Installing the Router on Non-U.S. Systems

- If you do an Easy Install, the appropriate modem scripts for your country are installed. If the Installer is unable to determine which foreign system you are using, the U.S. modem scripts are installed by default.

- If you do a customized installation, the U.S. modem scripts are installed automatically. However, you can install the modem scripts that are appropriate for your country by using the international modem scripts on the "Router Installer 2" disk. To install international modem scripts, follow these instructions:

  1. Open the Dial Up folder on the "Router Installer 2" disk.

  2. Open the International Modem Scripts folder.

  3. Open the folder with your country's name and drag the files in it to the Extensions folder on the router Macintosh.

- We recommend that you do an Easy Install of the router software on a Macintosh on which a version of the system software other than an English-language version is installed. During the installation, a message may appear, requesting you to use the "Network Software Installer" disk to place the latest version of AppleTalk on the startup disk. If this message appears, quit the Installer, then use the Network Software Installer to install the latest version of AppleTalk. Once you have done so, you can use the Router Installer disks to install the router software by clicking Install when the Easy Install dialog box appears. Following this procedure ensures that the versions of the AppleTalk system files installed use the correct language.

- During a custom installation, a message appears, warning you that continuing the installation replaces local-language versions of some AppleTalk system files (such as the Network control panel, AppleTalk, and EtherTalk) with English-language versions. If you click Continue, the installation will replace only files that have the same names as the files being installed. Thus, there may be two different versions of some AppleTalk system files on the startup disk—a local-language version and an English version. If you click Cancel, a message appears, informing you that an error has occurred during installation and the software on the startup disk was not changed.

ABS Tech Note: ARA00 About ARA Technical Notes (11/94)

==========

Article Created: 14 November 1994

TOPIC ----------

This document accompanies each release of Apple Business Systems Technical Notes.

DISCUSSION ----------

We want Technical Notes to be distributed as widely as possible, so they are sent to all Partners and Associates at no charge; they are also posted on AppleLink in the Developer Services Bulletin Board.

We place no restriction on copying Technical Notes, with the exception that you cannot resell them, so read, enjoy and share. We hope Apple Business Systems Technical Notes will provide you with lots of valuable information.

Technical notes are a 'living' complement to product documentation, be it Inside Macintosh or other documentation. This means that they are updated on a regular basis, so as to be accurate and up to date. New Notes are added as required.

This technical note is an index of all technical notes related to the AppleTalk Remote Access and related products. It also documents all changes to the technical notes since the previous release.

Index

Technical Note	Subject	Last Revision
ARA00	About ARA Tech Notes	Sep, 1994
ARA01	ARA ERS Corrections & Additions	May, 1994
ARA02	Error Correction	Sep, 1994
ARA03	ARA 2.0.1 known issues	Sep, 1994

Changes since last release:

LaserWriter Pro 810: Auto Select Tray Size with Incoming Faxes?

Revised: 1/6/94
Security: Everyone

LaserWriter Pro 810: Auto Select Tray Size with Incoming Faxes?

==========

Article Created: 6 January 1994

TOPIC ----------

When receiving an A-4 fax from Europe, will the LaserWriter Pro 810 auto select the A-4 paper tray to print on the correct size paper?

DISCUSSION ----------

If the printer was set up to Auto Cascade as the paper source then it doesn't matter what the size of the incoming fax is. The paper will be pulled from the first tray with paper in it. If the first tray happens to have A4 paper then all is well. I would imagine that for most applications in Europe that is an acceptable solution.

To force the fax to a different paper size you must specify the paper source explicitly (using the control panel). This is fine as long as you know that all your incoming faxes are going to be that size.

As a side note: I set up a LaserWriter Select 360 with a letter cassette and the multipurpose tray loaded with legal paper. I used the LaserWriter Utility to set the paper type in the multipurpose tray to legal. In this configuration the 360 would use legal paper for a legal size fax.

ABS Tech Note: ARA01 Corrections & Additions For The ERS (6/94)

Revised: 6/24/94
Security: Everyone

ABS Tech Note: ARA01 Corrections & Additions For The ERS (6/94)

==========

Article Created: 23 June 1994

TOPIC -----

The document "AppleTalk Remote Access, Application Programming Interface (API) External Reference Specifications" that is distributed with the developers kit has a number of errors and additions necessary to provide developers with a complete example specification. This technical note details the changes necessary to correct the document and its example code.

DISCUSSION -----

Minor typos and errors:

Page 7
---

1) Under LOAD the word 'to' is missing between "used" and "ensure".

2) The second sentence under LOAD. The structure referenced is

   TRemoteAccessParamHeader, the correct structure is
   TRemoteAccessParamBlock.

3) In the code example for LOAD the TRemoteAccessParamHeader should be
   changed to TRemoteAccessParamBlock.

4) Under UNLOAD the word 'to' is missing between "used" and "release".

5) The second sentence under UNLOAD. The struc referenced is

   TRemoteAccessParamHeader, the correct structure is
   TRemoteAccessParamBlock.

6) In the code example for UNLOAD the TRemoteAccessParamHeader should be
   changed to TRemoteAccessParamBlock.

7) The correct example code is:

```
#include "RemoteAccessInterface.h"
void UnloadRemoteAccess()
{
    TRemoteAccessParamBlock unloadPB;

   unloadPB.LOAD.csCode = RAM_EXTENDED_CALL;         // extended call
   unloadPB.LOAD.resultStrPtr = nil;                 // result string
   unloadPB.LOAD.extendedType = REMOTEACCESSNAME;    // to remote access
   unloadPB.LOAD.extendedCode = CmdRemoteAccess_Unload; // try to unload
   PBRemoteAccess(&unloadPB, false);                 // issue sync call
   if (unloadPB.LOAD.ioResult)
          ShowError(unloadPB.LOAD.ioResult);
     } // UnloadRemoteAccess
```

Page 8
------

1) There should be a space between guaranteed & Access in the fifth sentence. Additionally, Access should not be capped.

Page 9
------

1) In the DoConnect() example, TRemoteAccessConnectParam should be changed to TRemoteAccessParamBlock.

2) In the DoConnect() example the routine called CopyPStr is not defined. Instead you should use memcpy.

3) The structure pb should be changed to connectPB to make it consistent with the LOAD and UNLOAD commands. The corrected code would look like this:

```
#include "RemoteAccessInterface.h"
void DoConnect()
{
   TRemoteAccessParamBlock connectPB;
   Str255 PathName = "\pMyhardDisk:Remote Access:Connect Document";

   LoadRemoteAccess();           // Get the Remote Access Manager loaded
   connectPB.CONNECT.csCode = RAM_EXTENDED_CALL;    // extended call
   connectPB.CONNECT.resultStrPtr = nil;    // don't want result strings
   connectPB.CONNECT.extendedType = REMOTEACCESSNAME;// to remote access
   connectPB.CONNECT.extendedCode = CmdRemoteAccess_DoConnect;// connect
                                                              // command
   connectPB.CONNECT.portGlobalsPtr = nil;       // use the user port
   connectPB.CONNECT.fileInfo.vRefNum = 0;       // use the full pathnam
   connectPB.CONNECT.fileInfo.parID = 0;             //
   BlockMoveData (PathName, connectPB.CONNECT.fileInfo.name, PathName[0]
   + 1);
                                          // copy the string to the
                                          // fileInfo.Name
```

```
    // Ask for password if needed, use connection document, & show status
    pb.CONNECT.optionFlags = kNSCanInteract | kNSConnectDocument |
    kNSShowStatus;
    PBRemoteAccess(&pb, false);                      // issue sync call
    if (pb.CONNECT.ioResult)
         ShowError(pb.LOAD.ioResult);  // Do Error reporting and recovery
    UnloadRemoteAccess();
  } // DoConnect
```

Page 10
----

1) The code example for DoConnect() shown above should terminate with } // DoConnect so that it is consistent with the rest of the code examples.

2) In the DoDisconnect() example, TRemoteAccessDisconnectParam should be changed to TRemoteAccessParamBlock.

3) DoDisconnect() should be rewritten as follows:

```
  #include "RemoteAccessInterface.h"
  void DoDisconnect()
  {
     TRemoteAccessParamBlock disconnectPB;

     disconnectPB.DISCONNECT.csCode = RAM_EXTENDED_CALL;  // extended call
     disconnectPB.DISCONNECT.resultStrPtr = nil;      // don't want result
                                                      // strings
     disconnectPB.DISCONNECT.extendedType = REMOTEACCESSNAME; // to remote
                                                           // access
     disconnectPB.DISCONNECT.extendedCode = CmdRemoteAccess_Disconnect;
                                                    // disconnect command
     disconnectPB.DISCONNECT.portGlobalsPtr = nil;          // user port
     disconnectPB.DISCONNECT.abortOnlyThisPB = nil;   // don't get tied to
                                                      // any specific pb
     disconnectPB.DISCONNECT.optionFlags = 0 | kNSShowStatus; // show
                                             // status while disconnecting
     PBRemoteAccess(&disconnectPB, false);             // issue sync call
     if (disconnectPB.CONNECT.ioResult)
          ShowError(disconnectPB.LOAD.ioResult); // Do Error reporting and
                                                 // recovery
  } // DoDisconnect
```

Page 11
----

1) There is no code example for the IsRemote() function.

Page 12
----

1) GetStatus() should be rewritten as:

```
  #include "RemoteAccessInterface.h"
  void GetStatus()
  {
```

```
      TRemoteAccessParamBlock statusPB;
      Str255 UserName, connectedTo, lastMessage;
      long StatusBits;

      statusPB.STATUS.csCode = RAM_EXTENDED_CALL;          // extended call
      statusPB.STATUS.resultStrPtr = nil;               // put results here
      statusPB.STATUS.portGlobalsPtr = nil;             // do UserPort
      statusPB.STATUS.extendedType = REMOTEACCESSNAME;     // to Netshare
      statusPB.STATUS.extendedCode = CmdRemoteAccess_Status;  // status
                                                           // command
      statusPB.STATUS.userNamePtr = &UserName;
      statusPB.STATUS.connectedToNamePtr = &connectedTo;
      statusPB.STATUS.theLastStatusMsgPtr = &lastMessage;
      statusPB.STATUS.statusUserNamePtr = nil;
      statusPB.STATUS.statusMsgSeqNum = 0;
      PBRemoteAccess(&statusPB, false);
      if (statusPB.STATUS.ioResult)
           ShowError(statusPB.STATUS.ioResult);   // Do Error reporting and
                                                  // recovery
      else
      {
           // now decode the flag bits into words
           StatusBits = statusPB.STATUS.statusBits;
           if (StatusBits & CctlServerMode)
                printf("Answer Connection\n");
           if (StatusBits & CctlConnected)
                printf("Calling connection\n");
           if (StatusBits & CctlConnectionAborting)
                printf("Cancel in progress\n");
           if (StatusBits & CctlAnswerEnable)
                printf("Waiting for incoming call\n");
           if (StatusBits & CctlConnectInProg)
                printf("Connection in progress\n");
      }
  } // GetStatus
```

Note: The variable in the original code, lastSeqNum, causes a compiler warning because it is not needed in the code fragment pb has to be changed to statusPB to be consistent with previous code examples, lastly, the code fragment ends with the } // GetStatus to remain consistent with the other code fragments.

Page 14
----
1) MungePassword() should be rewritten as:

```
  #include "RemoteAccessInterface.h"
  void MungePassword(UserName, PassWord)
  unsigned char *UserName, *PassWord;
  {
     TRemoteAccessParamBlock mungePB;

     mungePB.MUNGEPW.csCode = RAM_EXTENDED_CALL;          // extended call
```

```
      mungePB.MUNGEPW.resultStrPtr = nil;                  // result string
      mungePB.MUNGEPW.extendedType = REMOTEACCESSNAME;  // to remote access
      mungePB.MUNGEPW.extendedCode = CmdRemoteAccess_PassWordMunger;
      mungePB.MUNGEPW.userNamePtr = (unsigned char *) &UserName;
      mungePB.MUNGEPW.passWordPtr = (unsigned char *) &PassWord;
      PBRemoteAccess(&mungePB, false);        // issue sync call
                                              // encrypt the eight bytes
                                              // pointed to by PassWord
      if (mungePB.MUNGEPW.ioResult)
           ShowError(mungePB.MUNGEPW.ioResult);

  } // MungePassword
```

Note: this code is rewritten to be more realistic as the user name and password would probably be passed in to a function like this as opposed to having them hard coded in the function itself. The TRemoteAccessParamBlock variable MungePB was changed to mungePB to be consistent with the other fragments, and the terminating line ends as } // MungePassword to be consistent with other examples.

2) In the GetCodeHooks section, the word are should be removed from the second sentence, or it should be rewritten.

ABS Tech Note: ARA02 Error Correction & Modem Scripts (11/94)

Revised: 11/14/94
Security: Everyone

ABS Tech Note: ARA02 Error Correction & Modem Scripts (11/94)

==========

Article Created: 14 November 1994

TOPIC ----------

This document discusses error control and data compression when using Apple Remote Access (ARA). Specifically, it details ARA's use with modems that support error control using CCITT V.42 as well as data compression using CCITT V.42bis. Regardless of which error control and/or compression protocols your modem supports, please refer to the manufacturer's documentation for more information on their availability and use.

DISCUSSION ----------

Why use error control or data compression?

Numerous modem manufacturers are now supplying error control and/or data compression as a method of assuring accurate and efficient communication between a pair of modems, even under less than optimal line conditions. Typically, these options are enabled via Hayes-compatible "AT" commands prior to dialing a number or readying a modem to answer calls and are employed whenever the overlying application does not support error correction and/or data compression.

ARA's use of error control and data compression

ARA implements V.42 error correction (MNP 4) from its' Client application to its' Server application, as the Macintosh Serial Port is judged to be unreliable. ARA implements V.42bis data compression (LZW) from its' Client application to its' Server application. Thus it is not necessary to enable these features on the modem (except for cellular data modems, which are discussed below). Modem scripts, as distributed by Apple and by cooperating modem vendors, should specifically disable these features to ensure the best possible performance. ARA data compression is more effective than what is implemented in modems, simply due to greater computational power available.

If you plan to write or customize a modem script, it is recommended that you do not use the error correction or data compression capabilities of your modem

without testing it with varying line quality, file type, and file size to see if the desired performance improvement has been achieved.

And what if data compression and/or error correction are used with ARA?

Some customers, with exceptionally noisy phone lines, have reported that enabling the primary V.42 error correction standard (LAP-M) from modem to modem, has given them improved connection reliability. Note that ARA still does MNP 4 error correction end to end, due to the unreliability of the Macintosh Serial Port. If you have this need, please consult your modem manual carefully, and note the use of USERHOOK 2 in the Modem Scripting Guide. This call alerts ARA that the modems have successfully negotiated a V.42 link, and ARA should relax its' re-transmit timers. Failure to call USERHOOK 2 could result in unnecessary timeouts, re-transmissions, and the connection being dropped. There is no method for turning off ARA V.42.

Some customers have expressed a desire to implement V.42bis data compression (or perhaps MNP 5) from modem to modem. Generally this hurts throughput, but if you have this desire, please consult your modem manual carefully, and note the use of USERHOOK 3 in the Modem Scripting Guide. This call alerts ARA that the modems have successfully negotiated a data compression link, and ARA should turn off it's own data compression. Failure to call USERHOOK 3 could result in performance losses, as ARA will be trying to compress already compressed data.

What's with the 'mlts' resource and varString 4?

During the development of ARA 2.0, we included the infrastructure for requesting that modems bring up a error correction link. VarString 4 was selected as the variable that would be set to indicate what type of error correction link was requested. The 'mlts' resource was selected as the way that the modem script writer could inform the CCL engine, that the modem had the capability to perform error correction. VarString 4 is controlled by an algorithm in the CCL engine. In future versions of ARA, the CCL engine may choose which modem script to use, based on values in the 'mlts' resource. Currently for the Personal Client/Server products, varString 4 = 0, unless the MNP 10 box is checked, in which case varString 4 = 2. Currently for the MultiPort Server product, varString 4 = 0. Setting 'mlts' byte 1 = 1 does not mandate that varString 4 be passed to the script with a value of 1. We recommend that modem script writers include 'mlts' resources and correct modem commands for varString 4 = 1, for future compatibility.

Using cellular modems with ARA

If an ARA connection is desired using cellular modems, you should enable the MNP10 capability in the modems. This is performed differently depending on whether you are configuring for ARA individually (Personal Server or Client) or for use with the MultiPort Server.

- For the Personal Server or Client, open the 'Remote Access Setup' Control Panel document and check the box named 'Use MNP 10 error correction in modem'. This will tell ARA to establish a connection using MNP10 (provided that modems that support MNP10 are being used). You must use a modem script that has been properly configured to support

both MNP10 and non-MNP10 modems.

- For the MultiPort Server, a check box is not used. Instead, you should configure the script to accept calls from both MNP10 and non-MNP10 modems.

Creating modem scripts for use with MNP10

If you need to create or modify a modem script for use with MNP10, ensure that you perform the following:

- Create an 'mlts' resource using ResEdit with byte 1 = 0x01

- Check if varString 4 is equal to '2'. If so, jump to the label that programs the modem to perform MNP-10.

- Issue a 'USERHOOK 4' for a successful MNP10 connection so that anything that polls the modem will know that MNP-10 is enabled. ARA data correction can not be disabled.

Here are some excerpts from an example CCL detailing the use of MNP10 with ARA. Note that this is not a complete CCL; only the relevant parts are shown for clarity.

```
!  'mlts' resource info for this modem:
!    byte 1 == 01 -> modem HAS builtin reliability protocols
!    byte 2 == 00 -> reserved by Apple
!    byte 3 == 43 -> max hex chars in varstr 7 (72 dec)
!    byte 4 == 43 -> max hex chars in varstr 8
!    byte 5 == 43 -> max hex chars in varstr 9
...
! If modem mnp10 link requested (var 4 == 2) then jump label 4
ifstr 4 4 "2"
...

WorldScript II 7.1.2: Difficulty Printing Color/Grayscale(1/94)

Revised: 1/6/94
Security: Everyone

WorldScript II 7.1.2: Difficulty Printing Color/Grayscale(1/94)

==========

Article Created: 6 January 1994

TOPIC --------------------

My computer crashes when I select color or grayscale in the print dialog and have 2-byte fonts in the document.

DISCUSSION --------------------

This is a known issue with the 7.1.2 version of the WorldScript II extension. These situations can result in a crash when you select color or grayscale in the print dialog to print a document with 2-byte fonts:

- You change the printer selection, and try to print again before restarting.
- You use a non-Apple printer driver (it's unknown if the Adobe 8.x driver is more likely to provoke this).
- You don't have much memory available (either a low-memory CPU or a lot of applications are running).

Campus Software Set for Macintosh: Opening Documentation (1/94)

Revised: 1/6/94
Security: Everyone

Campus Software Set for Macintosh: Opening Documentation (1/94)

==========

Article Created: 6 January 1994

TOPIC --------------------

I purchased the Campus Software Set for Macintosh, and I can't open the electronic documentation for Macintosh PC Exchange or Retrieve It! programs.

DISCUSSION --------------------

The documentation for these applications is provided electronically only in Apple DocViewer version 1.0 format. If you can't open the documentation, be sure that DocViewer is installed. The installer for this package will place the DocViewer application in a folder called "Retrieve It! folder" at the top level of the hard disk. If you can't find Apple DocViewer v1.0 on the drive, run the installer for the Campus Software Set for Macintosh again, select Custom, and reinstall only the software for Retrieve It! as this will also reinstall Apple DocViewer v1.0.

Hebrew 3270 Emulation (1/94)

Revised: 1/6/94
Security: Everyone

Hebrew 3270 Emulation (1/94)

==========

Article Created: 6 January 1994

TOPIC ----------

This article briefly describes a Hebrew 3270 terminal emulation.

DISCUSSION ----------

Heb3270 allows a Macintosh computer with a TCP/IP network connection to emulate an IBM 3270 terminal with Hebrew language capability. Heb3270 provides:

- Bilingual Hebrew/Latin computer interaction
- Graphic support for 3179 compatible graphics
- File transfer acting as a FTP server
- VT220/320 terminal text emulation

For information contact Bioinformatics Unit, Biological Services. To locate a vendor's address and phone number, use the vendor name as a search string.

CD Setup v 5.0: READ ME File (1/95)

Revised: 1/12/95
Security: Everyone

CD Setup v 5.0: READ ME File (1/95)

==========

Article Created: 6 January 1994
Article Reviewed/Updated: 12 January 1995

TOPIC ----------

This is the READ ME document that comes with CD Setup v5.0. This READ ME file is also on products that ship with CD Setup v5.0, including the AppleCD 300 Plus and AppleCD 300i Plus drives.

DISCUSSION ----------

This Read Me document provides late-breaking and important news about the AppleCD 300 Plus drive and the software for it.

VIEWING LARGE PHOTO CD IMAGES
Some programs, such as TeachText, may have difficulty opening large (high-resolution) image files on a Photo CD. To view these images, you can change the application program that opens the Photo CD images and use a program designed to handle larger files. See the manual that came with the CD-ROM drive for more information. You can also change the amount of memory a program uses. See the manuals that came with your computer for more information on managing memory.

DISPLAYING COLOR ICONS FOR IMAGES ON PHOTO CDs
When your computer is low on memory, it may have problems displaying color icons for the images on a Photo CD. Although some icons may appear as black-and-white document icons, the Photo CD images themselves are not affected. To display color icons, quit all open programs, restart your computer, and reopen the Photos folder on your Photo CD. See the manuals that came with your computer for more information on managing memory.

SETTING SOUND OPTIONS FOR SOME MACINTOSH COMPUTERS
Some Macintosh computers (such as the Macintosh Quadra 660AV and 840AV) have special sound recording options. If you don't hear any sound when you play an audio CD or an audio track on a CD-ROM disc, you may have the sound options set incorrectly. To change the options, open the Sound control panel, choose Sound

In from the pop-up menu at the top of the panel, and then select the Built-In icon for the audio source. Click the Options button, select Internal CD, make sure the Play through box is checked, and click OK. See the manuals that came with your computer for more information.

ADJUSTING THE VOLUME FOR SOME MACINTOSH COMPUTERS

Some Macintosh computers allow you to increase or decrease the volume of sound through the Sound control panel, as well as through the volume control in your audio CD software. The manuals that came with your computer describe the Sound control panel if your computer has one. The manual that came with your CD-ROM drive describes the audio CD software.

DISPLAYING THE TOTAL PLAYING TIME FOR CUSTOMIZED PLAY LISTS IN APPLECD AUDIO PLAYER

If the total playing time of your customized Play List for an audio CD is longer than 99 minutes and 59 seconds, the Time display in the AppleCD Audio Player shows 99.99. (The Time display can't display times of more than 2 digits and 2 decimal points.)

WORKING WITH PHOTO CDs IN SYSTEM 6

If you have System 6 and want to view Photo CDs, turn MultiFinder on before you insert a Photo CD into your CD-ROM drive. If you are in the Finder, your computer may not have enough memory to start up the Photo CD. (See manuals that came with your computer for instructions on how to turn MultiFinder on.) Once you turn MultiFinder on, place the Photo CD in the tray of the CD-ROM drive and push the tray in (or press the Open/Close button) to close the tray of the CD-ROM drive. In a few moments, the Photo CD disc icon appears; you can now view images on the Photo CD.

USING THE SLIDE SHOW VIEWER IN SYSTEM 6

If you view photographic images in a sequence using the Slide Show Viewer and you want to look at images from more than one Photo CD, do not start up the Slide Show Viewer from the Photo CD. Copy the Slide Show Viewer onto your hard disk, and use that copy to view photos. If you start up the Slide Show Viewer from the Photo CD, you will experience problems when you insert the next Photo CD.

EJECTING CD-ROM DISCS IN AT EASE

If you are using At Ease (an alternative to the usual Macintosh desktop) and you want to eject a CD-ROM disc, make sure you eject the disc before you shut down your computer. The Open/Close button of your CD-ROM drive does not work when the computer is shut down. To eject a disc while using At Ease: Choose the Eject command from the Special Menu. Remove the disc and close the tray by pushing it in or pressing the Open/Close button.

WARNING: If you shut down your computer before you eject a disc while you are using At Ease, the tray of the CD-ROM drive opens and then closes immediately. If you attempt to remove the disc as the tray opens or closes, you may damage the disc or the tray of the CD-ROM drive. (To remove a disc from the CD-ROM drive after you have shut down your computer: Start up your computer, then choose the Eject command from the Special Menu. Remove the disc and close the tray by pushing it in or pressing the Open/Close button. Then you can shut down your computer again.)

Note: At Ease 2.0.3 corrects this problem. Additional information is in the Tech Info Library article titled "At Ease 2.0.3: Corrects AppleCD 300 Plus Ejection Problem"

FULL INSTRUCTIONS
See the manual that came with your CD-ROM drive for full instructions on using the CD-ROM drive.

GeoPort Telecom Adapter: Can Send Without Fax Cover Sheet(1/94)

Revised: 1/6/94
Security: Everyone

GeoPort Telecom Adapter: Can Send Without Fax Cover Sheet(1/94)

==========

Article Created: 6 January 1994

TOPIC ----------

I have a Macintosh Quadra 840AV and a GeoPort Telecom Adapter. I'd like to send only the fax cover sheet using the Express Modem Software that came with the Adapter. Since I can only fax from within an application that prints, I can't send just the fax cover sheet. How can I send a fax with just the cover?

DISCUSSION ----------

You can't just send the fax cover sheet that's installed with the Fax Cover application. However, you can send just your fax without the cover sheet. You do this by choosing "none" from the Fax Sender Cover Page pop-up menu. This will mean that no cover page is attached to the fax. Therefore, the first page of your document will now be your "cover page."

Newton Print Pack: User Guide And Troubleshooting (4/97)

Revised: 4/21/97
Security: Everyone

Newton Print Pack: User Guide And Troubleshooting (4/97)

==========

Article Created: 6 January 1994
Article Reviewed/Updated: 21 April 1997

TOPIC -----

This article describes how to use the Newton Print Pack and troubleshoot common problems.

DISCUSSION -----

Description

The Newton Print Pack is a cable containing a serial to parallel data converter and ROM-based printer drivers. These printer drivers are downloaded to the Newton MessagePad by powering on the MessagePad after the Print Pack is connected between the printer and MessagePad.

Using the Print Pack
---
1) Power off both the MessagePad and the printer.

2) Connect the Print Pack between the MessagePad and the printer.

3) Power on the MessagePad and wait ten (10) seconds. During this time, the LED on the Print Pack should flash twice; the first flash is short and the second flash is longer. At the end of this period, the printer drivers should be downloaded to the MessagePad.

4) Power on the printer and print the desired item(s).

5) In the printing slip, "choose other printer" will display the following new choices:

epson lx, epson fx, hp deskjet, hp laserjet, canon bubblejet.

The Tech Info Library articles titled, "Newton Print Pack: Compatible Printers

(A-L)" and "Newton Print Pack: Compatible Printers (M-Z)" list the compatible printers and the driver you should select.

Problem: the drivers did not appear

Verify that the red light on the parallel plug turns on as you power on your Newton.

If you continue to have printing problems, reset the Newton and try these steps again.

If your MessagePad unexpectedly powers off while printing or immediately after it is powered on, be sure to install fresh batteries or connect your MessagePad to AC power. The Print Pack draws a large amount of power while printing or at start up (when your MessagePad is downloading the printer drivers), and this may discharge the MessagePad's batteries.

Problem: the drivers disappear after a while

Newton OS 1.x systems will unload the drivers when the MessagePad goes to sleep or loses power. You will need to reconnect the cable and cycle power before being able to print.

Newton OS 2.x systems store the drivers as normal packages.

At Ease 2.0 for Workgroups: Copy to Floppy Disk Command (8/95)

Revised: 8/9/95
Security: Everyone

At Ease 2.0 for Workgroups: Copy to Floppy Disk Command (8/95)

==========

Article Created: 6 January 1994
Article Reviewed/Updated: 9 August 1995

TOPIC ----------

The Copy To/From Floppy disk command doesn't show up in the File menu of At Ease 2.0 for Workgroups.

DISCUSSION ----------

In the Options section (not the Options menu) of At Ease Setup, you must set the "Location of User documents:" radio button to the "folder on At Ease disk." If this isn't set, the user doesn't have the access privileges to make any changes to the hard drive. Without permissions to write to the hard drive, At Ease won't allow the user to copy from the hard drive. If you want to deny access, the user can work around this by opening the desired document and choosing Save As from the File menu to save to the user's floppy disk.

Macintosh AV Series: Apple Remote Access & GeoPort (1/94)

==========

Article Created: 7 January 1994

TOPIC -----

I'm trying to use Apple Remote Access with GeoPort Adpater on my Macintosh AV computer. According to page 118 in the Express Fax Modem User's Guide, I need a CCL description file apparently other than the file used to connect to AppleLink. Where can I find this file?

DISCUSSION -----

The manual refers to the name of the file which is used by the PowerBook Express modem. With a GeoPort Adapter, you need the file called "Geoport™ Telecom" installed in the Extensions folder inside the System Folder. The Express Modem for GeoPort software Installer properly install this file.

All the other files required for Apple Remote Access should be installed by the Apple Remote Access Installer. However, you need to remove the file called "Serial Port Arbitrator" from the Extensions folder inside the System Folder. The Serial Port Arbitrator file is not required in this instance. Failure to remove the Serial Port Arbitrator file may result an Error -23.

Macintosh AV: Large Screen Video Capture Unsupported (11/95)

Revised: 11/13/95
Security: Everyone

Macintosh AV: Large Screen Video Capture Unsupported (11/95)

==========

Article Created: 7 January 1994
Article Reviewed/Updated: 24 May 1995

TOPIC ----------

I have a Macintosh AV Series computer connected to a Macintosh 21-inch Color Display. I'm unable to display or capture color video from a VCR or camera. I can only get black and white. Is there any way to do so?

DISCUSSION ----------

The Macintosh AV Series computers, including the Power Macintosh AV models, cannot display or capture 8-bit color video on displays using a resolution greater than 832x624 (17-inch, 19-inch, 20-inch, and 21-inch).

The reason is both VRAM and other on-board video circuitry are not fast enough to transfer the 8-bit color video data to the screen on larger monitors and the CPUs are only fast enough to dump the luminance data, so only 8-bit monochrome (grayscale) video can be displayed or recorded.

Article Change History:
13 Nov 1995 - Clarified type of video and Macintosh models.
24 May 1995 - Clarified black and white, not color capture.
18 Jul 1994 - Added other monitor sizes and reference to Power Macintosh.

LaserWriter Select 360: Size Limit of Phone Directory For Fax?

Revised: 1/10/94
Security: Everyone

LaserWriter Select 360: Size Limit of Phone Directory For Fax?

==========

Article Created: 10 January 1994

TOPIC --------------------

Is there a limit to the size of the Fax Phone Book for the fax option?
A customer has 1500 names and wants to make sure there won't be a problem adding that many names before she sets it up.

DISCUSSION --------------------

Engineering indicates that they are aware of performance problems when OVER 100 addresses are added to the Fax Phone Book. The recommendation is to limit the number of addresses in the phone book to 100 or less. If more addresses are added to the phone book the system may crash or hang.

The only workaround I can think of is to rename an existing phone book which will automatically create a new one with the name "Fax Phone Book" the next time the Fax option is used. A user could switch from phone book to phone book by renaming the active phone book to something else and renaming the phone book that is to be used to "Fax Phone Book." Not the greatest solution but that's the only solution I can think of given the current software.

ABS Tech Note: AS06 AppleSearch and XTND (6/94)

Revised: 6/24/94
Security: Everyone

ABS Tech Note: AS06 AppleSearch and XTND (6/94)

==========

Article Created: 23 June 1994

TOPIC -----

This technical note describes AppleSearch and XTND technology.

DISCUSSION -----

When AppleSearch is indexing data, if the file is a text file, it will import it directly. For files that are formatted, however, it uses the XTND technology to import the data. This has the advantage of allowing AppleSearch to be extended easily to support new data types, but also creates some potential reliability issues that need to be considered.

Supported file formats

AppleSearch 1.0 ships with an XTND that supports the following file formats. The formats are all supported by the MacLinkPlus XTND that ships with AppleSearch: MacWrite v4.5, v5.0 and vII; Word Perfect v1.0, v2.0, v2.1 (Mac); MS Word v3, v4, v5, v5.1 (Mac); MS Works WP v2.0 & v3.0; FrameMaker MIF v2.0, v3.0; PageMaker 4.0; Ragtime 3.1; AppleWorks; WriteNow v2, v3; Nisus v3; PICT (only text extraction); EXCEL (tab text - no formula); MS Word for Windows - 1.0, 2.0; and WordPerfect for Windows - 5.1.

To support additional formats, DataViz has an XTND that supplements AppleSearch 1.0 and supports the following formats: Macintosh Word Processing; FrameMaker MIF - 2.0, 3.0; Nisus - 3.0; MacWrite - 4.5, 5.0; MacWrite II; MS Word Mac - 3.0, 4.0, 5.0, 5.1; MS Works WP Mac - 2.0, 3.0; PICT (text extraction); Ragtime - 3.1; Rich Text RTF; WordPerfect Mac - 1.0, 2.0, 2.1; WriteNow - 2.0, 3.0; AppleWorks WP - 2.0, 3.0, GS.

It also supports importing the following DOS formats: AmiPro - 1.0, 2.0; DCA-RFT; MS Word DOS - 5.5; MS Word for Windows - 1.0, 2.0; MS Works WP DOS; MS Works WP Windows; Multimate; Multimate 4; OfficeWriter - 5.0, 6.0; Professional Write; WordPerfect DOS - 4.2, 5.0, 5.1; WordPerfect for Windows - 5.1; WordStar 3.4, 5.5, - 7.0; XYWrite III. The following spreadsheet formats are available as

tabbed text as well: AppleWorks SS; Excel - 2.2, 3.0, 4.0; Lotus - WKS, WK1; MS Works SS Mac - 2.0, 3.0; MS Works SS DOS; MS Works SS Windows; SYLK. To get the XTND that supports these additional formats, please contact DataViz for pricing and availability.

XTND warnings

If you're planning on installing your own XTNDs into AppleSearch, there are a couple of potential problems you need to be aware of.

First, we've found that some publicly available XTNDs have bugs or memory management problems that might not show up under casual use, but under the heavy use AppleSearch makes of XTND can cause server failures. An XTND used by a word processor to import a file that leaves a memory pointer allocated doesn't usually cause a problem, but that same XTND being used to import 1,500 files can significantly fragment memory and cause the server to fail. If you install your own XTNDs and start having server reliability problems, you should remove them and test them individually for problems.

Also, the XTND protocol allows one XTND to define itself as the XTND that attempts to translate any unknown formats. The XTND shipped with AppleSearch is one of these, so if you install your own default XTND, AppleSearch will give priority to its own and your XTND will never get called.

Please note that not all XTNDs will work under AppleSearch. AppleSearch requires that the XTNDs do text extraction, not format conversion. We have found, for instance, that the ClarisWorks XTND will not function under AppleSearch.

Newton: -20006 Error During System Update (1/94)

Revised: 1/10/94
Security: Everyone

Newton: -20006 Error During System Update (1/94)

==========

Article Created: 10 January 1994

TOPIC -----

When I update my Newton MessagePad's system software by modem, I continually get a -20006 error. How do I recover from this?

DISCUSSION -----

If you get a -20006 error when updating your MessagePad's system, call 1-800-SOS-APPL and talk to a representative in the Newton Support group. The -20006 error means that the update server needs to be reset.

After calling, wait three to four hours before trying to update again. This will ensure the server has been reset.

AppleShare 4.0 Print Server: Not Printing Error Pages (1/94)

Revised: 1/11/94
Security: Everyone

AppleShare 4.0 Print Server: Not Printing Error Pages (1/94)

==========

Article Created: 10 January 1994

TOPIC -----

I have set AppleShare 4.0 Print Server, banner page to off. However, when a print job is deleted from the print-queue, a page kicks out indicating that the print job has been deleted.

Is this "feature" changeable? I have an expensive output device, and I'm disturbed by the waste of supplies and time having such information printed.

DISCUSSION -----

There is no supported method for preventing the AppleShare Print Server 4.0.x software from printing error pages. However, we have a ResEdit patch that will prevent AppleShare Print Server 3.0.x, AppleShare Print Server 4.0.x, and AppleShare Print Server Pro from printing error pages. Here are the directions:

1) Use ResEdit to open the AppleShare Print Server application.

2) Open the "EXOP" resource with an ID of 128; it should be the only one.

3) Change the first four zeros (0000) to ones (1111).

4) Quit ResEdit saving the changes made to the AppleShare Print Server application.

Now the AppleShare Print Server application should no longer print error pages.

Note: This is NOT a supported solution.

Apple Personal Diagnostics and MacTest Pro Compared (8/94)

Revised: 8/30/94
Security: Everyone

Apple Personal Diagnostics and MacTest Pro Compared (8/94)

==========

Article Created: 11 January 1994
Article Reviewed/Updated: 30 August 1994

TOPIC ----------

This article compares Apple Personal Diagnostics and MacTest Pro.

DISCUSSION ----------

Apple Personal Diagnostics (APD) is an end-user diagnostic and troubleshooting tool with a very simple interface. The diagnostic tests function across the entire current Macintosh (Macintosh Plus through Macintosh Quadra, including the Performa) and PowerBook line of computers. The APD application, which also includes benchmarking and system profiling features, is contained on a single non-bootable 800K disk. Technical Support for APD will be handled just like other Apple software (by calling 1-800-SOS-APPL).

MacTest Pro is repair-oriented diagnostic software that can test logic boards, video cards, monitors, floppy drives, hard drives, and CD ROM drives. It can also detect software corruption problems, and the existence of multiple System Folders on a volume. MacTest Pro is intended for use by Apple service technicians.

Although APD is a valuable tool for the end-user, we continue to recommend MacTest Pro over any other diagnostic and repair verification tool for service technicians. Here are some of the important reasons why:

- MacTest Pro is a subscription product with regular releases that are timed to coincide with major Apple CPU releases. APD is not a subscription product.

- MacTest Pro contains a comprehensive set of diagnostic tests that are CPU-specific in nature. The APD diagnostic tests are not CPU-specific.

- MacTest Pro performs diagnostic tests on modems, CD-ROM drives, and NuBus cards. APD does not perform these tests.

- MacTest Pro enables service technicians to provide the most up-to-date support for their customers. Updates also include coverage of newly released CPUs and improvements to the MacTest Pro application.

- MacTest Pro test modules are customizable, enabling the technician to respond to unique diagnostic and verification situations. APD does not have individual test modules and therefore cannot be reconfigured.

- MacTest Pro contains valuable on-line window help, error code, and system error information. APD does not contain on-line window help. Some error code and system information is contained in the APD User Manual.

Apple Service strongly recommends the use of MacTest Pro as the primary diagnostic and repair verification tool for all Apple Authorized Service Providers.

ABS Tech Note: AWS19 Adding a UFS Drive (1/94)

Revised: 1/11/94
Security: Everyone

ABS Tech Note: AWS19 Adding a UFS Drive (1/94)

==========

Article Created: 23 December 1993

TOPIC ----------

Some customers using the AWS 95 have experienced difficulty adding additional UFS drives to a server. This problem occurs when they set up their drives on a Macintosh other than the server they will be used on. The "Apple HD SC Setup" program that is supplied with the AWS 95 system software protects administrators from the details of creating UNIX mount points, which are necessary to make the drive available. If the drive is formatted on another machine, these mount points are not created on the server, so the disk will not be accessible, which confuses some users. This Technical Note will endeavor to provide step-by-step instructions for adding a UFS drive to the Apple Workgroup Server (AWS) 95.

DISCUSSION ----------

The following steps need to be taken to install a disk onto a server. It assumes you are using Apple HD SC Setup or some third party formatting tool that supports UNIX partitioning. The drive that will be used in this example is a Micronet CPK-200, set to SCSI ID #5.

Use the formatting tool to create a "Free UNIX slice 3" on the disk, which creates the partition we will be using. Attach the disk to the server, and then execute this command from CommandShell:

```
newfs /dev/rdsk/c5d0s3 Generic
```

The parameter "Generic" (which is case sensitive) in the command line specifies that there is no specific drive entry in the /etc/disktab file. Entries are provided for some disks. If your disk is not one of them, you can either specify "Generic" for the drive type or provide the drive information from the manufactures documentation. This information allows newfs to tune the disk performance somewhat, but isn't critical, so if you don't have it handy, the Generic entry is usually close enough.

The AWS 95 supports 4 logical SCSI busses number 1-4 so that when you connect the drive to the PDS card's external connector, the command that you will need to enter changes to the following:

```
newfs /dev/rdsk/c405d0s3 Generic
```

Since you have not used "Apple HD SC Setup" program you will also need to create an entry in the /etc/fstab file so that this drive can be automatically mounted when the system is restarted. For this example we will assume that the drive will be mounted on a directory within the "/Shared Data" folder. Open the /etc/fstab file by traversing in the Mac environment and double-clicking on the file. The file should look something like the following:

```
/dev/dsk/c300d0s0   /    ignore  rw  1 0
```

Now append a new line to the file specify an existing directory in the / Shared Data folder.

```
/dev/dsk/c205d0s3   /\ Shared\ Data/NewVolume    4.2  RW  1 2
```

In this instance the NewFolder that is used for the mount point is NewFolder. The back slashes are necessary as the string / Shared Data has a space in it. You can create the directory for NewVolume from the CommandShell or from the Mac environment. Now you can close and save the /etc/fstab file.

To make this volume accessible to users you can enter the following command from the CommandShell:

```
mount -a
```

If there is a problem you will see some error text after this command is executed. To verify that the drive is now accessible you can type mount and receive output similar to the following:

```
/dev/dsk/c300d0s0   on /  type 4.2 (rw,noquota)
/dev/dsk/c205d0s3   on / Shared Data/NewVolume    type 4.2 (rw)
```

When adding new drives to the AWS 95 it is also important to add them to the PDS card as this will give you maximum performance. The DMA and Cache provided by the card will help increase I/O as compared to the motherboard internal and external busses.

ABS Tech Note: AWS20 Multi-Homing & IP Forwarding (6/94)

Revised: 6/24/94
Security: Everyone

ABS Tech Note: AWS20 Multi-Homing & IP Forwarding (6/94)

==========

Article Created: 23 June 1994

TOPIC

This tech note explains the differences between Multi-homing and IP (Internet Protocol) forwarding/routing, and how these capabilities can be achieved under A/UX.

DISCUSSION

Multi-Homing

A/UX supports multi-homing. It's possible that you may have multiple IP (Internet Protocol) interfaces (for example Ethernet Adapters) running under A/UX. As a result, your A/UX system may appear on and have access to different TCP/IP networks which may not be connected. To set up your A/UX system for multi-homing, follow the steps 1 through 3 oulined in the configuartion section below.

IP Forwarding / Routing

A/UX also supports IP routing or forwarding. This means that an A/UX system with more than one IP interface is configured to run as an Internet forwarder /router, and knows how to route IP traffic between two separate networks. IP forwarding/routing helps in extending the topology of your Ethernet network. To configure your system to be an Internet forwarder / Router, follow all the steps outlined in the configuration section below.

Configuration

To set up your A/UX system for multi-homing and/or Internet forwarding/Routing functionality, install a second IP interface, per the instructions provided by the card manufacturer and connect the network cable that came with the card to the second network and follow the steps steps outlined below. In both situations, a Macintosh computer running A/UX can be connected to two separate networks by using two IP interfaces.

1) Log in as root , after A/UX boots up.

2) Make a new kernel by typing the following command:

```
newconfig bnet appletalk
```

This will create a new kernel that will include the necessary modules for Ethernet (ao, as or ae6) , TCP/IP and AppleTalk support. Please note that newconfig will prompt you for the Internet address and netmask for the additional Ethernet card. It will also display the interface name such as ae0 etc.

3) When newconfig is done, restart A/UX.

4) After restarting A/UX, log in as a root and enable IP forwarding by typing the following adb (kernel debugger) command. (IP forwarding defaults to OFF on A/UX 3.0 and later versions.) The following lines show the commands you enter italic type and the output of adb in boldface.

```
#adb -w -k  /unix   /dev/kmem
 a.out file = /unix (COFF format)
 core file = /dev/kmem
ready
ipforwarding?D
ipforwarding:      0
ipforwarding?W  1
ipforwarding:   0x0        =    0x1
$w
$q
```

Then reboot A/UX so that the change will take effect. You might also want to make the same change to the /etc/install.d/boot.d/bnet_dr file (adb -w bnet_dr) in case you build a new kernel via newconfig on the forwarder /router system at some later date.

5) Enable routed daemon on each computer on the networks. To start in.routed manually, enter the following command:

```
/etc/in.routed
```

Alternatively, you can change the action field for the /etc/in.routed entry in the /etc/inittab file to wait, which can cause in.routed to start automatically.

6) Modify/check the /etc/hosts file on all computers to include host name and IP address of all the systems on the network and /etc/networks file on all computers to contain the host name and the network number.

7) Modify /check the /etc/NETADDRS file to configure IP and broadcast addresses and netmasks for each card.

The user will be prompted for the information as in the above steps 6 and 7, while running newconfig. See Chapter 6 Creating and Managing a TCP/IP Network of the Server Administration With A/UX 3.0.1 manual, for the detailed description on Routing and Forwarding.

Note: MacTCP under A/UX supports only one control panel CDEV, attributing to ONLY one IP interface, and does not let you access /select multiple IP interfaces. In other words, you cannot change/switch IP interface from the A/UX finder and changing the interface selection in the MacTCP CDEV has no effect.

ABS Tech Note: AWS21 A/UX & Micropolis Drives (6/94)

Revised: 6/24/94
Security: Everyone

ABS Tech Note: AWS21 A/UX & Micropolis Drives (6/94)

==========

Article Created: 23 June 1994

TOPIC ----------

This article describes a problem with A/UX 3.0.1 and A/UX 3.0.2, and Micropolis drives.

DISCUSSION ----------

There is a known problem with A/UX 3.0.1 and A/UX 3.0.2, and Micropolis drives. The actual problem is in the firmware of the Micropolis drives. The problem is compounded by a problem in A/UX which has been fixed in A/UX 3.1. Note: Apple Computer has not shipped a product that uses Micropolis hard disks. Only customers that have purchased third-party hard disks with Micropolis mechanisms need to be concerned with this issue.

When using A/UX 3.0.2, the A/UX System Console window (Command-zero from the CommandShell) displays a list of the connected SCSI devices. This list shows the name, model, and firmware revision of the SCSI devices. This information will make it easier to determine what SCSI drives are in use. A/UX 3.0.1 customers should install the AWS 95 Tune-Up 1.0. Once this is done, they will be running A/UX 3.0.2.

When a request is made for a large amount of data (128 Kbytes), Micropolis drives are returning 1 sector too few (127.5 Kbytes) but reporting the transfer as okay. At this point, A/UX should generate an error. However, A/UX has "special case" code that determines the last 512 bytes did not actually get transferred. A/UX re-issues the request with the correct residual count (512 bytes). Unfortunately, A/UX uses the wrong memory address and writes the 512 Kbytes to the same place the original data was written. The end result is the first and last 512 bytes of the 128 Kbyte transfer are invalid.

The solutions:

1) Micropolis is now aware that their SCSI disk firmware is behaving incorrectly and will soon have a fix available for their customers. Once

the SCSI disk firmware is fixed, customers should no longer see the problem.

2) In A/UX 3.1, Apple has fixed the "special case" code so the residual 512 bytes are written to the correct location. This will allow the AWS 95 to use Micropolis drives even if their firmware has not been updated.

The work around:

There is a work around for this problem for customers that have yet to get the fix from Micropolis. The work around is to patch A/UX using "adb" so the largest request of data is 64 Kbytes instead of 128 Kbytes. This prevents the condition described above from ever occurring. The performance of the AWS 95 should not be noticeably affected by this patch. The work around changes the file /etc/config.d/newunix. Make a copy of this file before proceeding. You should also be logged in as the "root" user. Since you will be rebooting the machine at the end of this procedure you should make sure that the timing is convenient for active users of the system.

Create a shell script (file) called "micropolis" with the following lines of text:

```
adb -w /etc/config.d/newunix << EOF
maxba?W 8
maxwb?W 8
EOF
newconfig
```

After the file is created, it needs to be made executable. To do this, type the following in the CommandShell and hit return:

```
chmod +x micropolis
```

Now type micropolis in the CommandShell and hit return.

The output to the CommandShell should look something like this:

```
a.out file = /etc/config.d/newunix (COFF format)
cannot open core
ready
maxba:          0x10            =       0x8
maxwb:          0x10            =       0x8
newconfig: Making backup copies of /etc/inittab /etc/passwd /etc/group.
newconfig: Preparing to build a new kernel.
newconfig: Building a new kernel (this may take several minutes).
newconfig: Restoring kernel parameters.
newconfig: Checking for any installation information.
 1 ao Ethernet card(s) installed
ao0: IP address 138.45.4.72
     netmask 255.255.255.0
     broadcast address 138.45.4.255
newconfig: To avoid kernel/device inconsistencies, reboot immediately.
   The new configuration will take full effect when the system is
```

rebooted.

After you have done this, restart the Macintosh.

The following is a current list of Micropolis drives with their current firmware revisions that are known to work properly with A/UX 3.x. Please note that this list is subject to change:

Model(s)	Firmware	Checksum	Filename
1926, 1936	hw0a_11	97b8	hw0a-11.mac
21xx series	4930010a	b540	4930010a.mac
22xx series	4930010a	b540	4930010a.mac
22xx-AV series	No know problems		
1548, 1624, 1908, 1924	Not yet available		

In all cases, we recommend customers update their Micropolis firmware. For more information, please contact:

ARA 2.0 MultiPort Server and Client On Same Computer (1/94)

==========

Article Created: 12 January 1994

TOPIC ----------

Can the Apple Remote Access (ARA) 2.0 MultiPort Server and 2.0 Client run on the same Computer?

DISCUSSION ----------

No, they can not be run on the same computer. This is due to differences in the link managers used by the two products.

System 7 Pro: Turn-around Time For Digisign Processing (7/94)

==========

Article Created: 13 January 1994

TOPIC --

A customer with System 7 Pro (7.1.1) sent the Digisign information approximately 3 weeks ago (to RSA Data Security, Inc.) to the correct address and has not received a reply yet.

DISCUSSION --

I have contacted RSA and received the following information:

- The "usual" turn-around for signature processing is two weeks from the time the request is received at RSA.
- It is ok to give customers the phone number, after they have been told of the "expected" turn-around time.
- The phone number is (415) 595-8782 and they should ask for "Certificate Services".

ARA 1.0 and Express Modem FAX (1/94)

Revised: 1/17/94
Security: Everyone

ARA 1.0 and Express Modem FAX (1/94)

==========

Article Created: 12 January 1994

TOPIC -----

I'm using the Express Modem software with his Quadra 840AV and GeoPort Adapter. I have installed AppleTalk Remote Access (ARA) 1.0 and the GeoPort Adapter software. I would like to be able to set AppleTalk Remote Access and FAX Terminal to auto-answer. Unfortunately, my Quadra 840AV with GeoPort Adapter will not accept a FAX from his FAX machine in this configuration. According to Appendix A on page 81 of the Express FAX/Modem User's Guide, this should work. The manual states:

"If both programs are set to auto-answer, the modem answers after the number of rings designated in the Data User Program. If the call is a FAX call, it is passed to the FAX server. If the call is intended for the data server, it is not passed to the data server (data user programs take precedence over data server programs) because the data port cannot distinguish between the two data programs."

I tested my configuration and found that I could get this to work if I went from Express Modem to Express Modem. However, as soon as I went from a Lanier FAX Model 3800 to Express Modem, the system would not accept a FAX. It would answer and then hang up.

What is happening here and is there a fix?

DISCUSSION -----

The problem quite simply is that some FAX machines do not send the mandatory FAX "calling tone" and therefore are not recognized as "FAX" when the FAX Arbitrator is active and deciding whether an incoming call is FAX or Data.

There is nothing that can be done by the receiving software to determine that it is a FAX when this calling tone is missing from the sending FAX machine. When only FAX Terminal is active and waiting to answer there is

no problem, as it assumes that all calls are for it.

Both the Konica FAX 280 Intelligent Facsimile and the Lanier FAX models 2235 and 3800 do not send this calling tone. The Panasonic Panafax PX-350 does send the calling tone and therefore it works with both FAX Terminal and ARA waiting to answer calls on the GeoPort.

For a customer who questions whether their sending FAX should be able to work with both FAX Terminal and ARA waiting to receive calls, the calling tone is a one-second beep, followed by a one-second pause, followed by the 'phone ring'. The beep can actually occur before -- or after -- the phone ring, that is the sequence can be ring-pause-beep instead. Regardless, this three-second sequence must start as soon as the dialing modem goes off-hook.

The following is specified in the CCITT specification:

"Calling Tone: To indicate a calling non-speech terminal. This signal is mandatory for automatic calling and optional for manual units."

This is not an Express Modem problem, but rather a limitation of the calling FAX machine.

PostScript Level 2 and CCITT Group 4 decompression for bit maps

Revised: 1/13/94
Security: Everyone

PostScript Level 2 and CCITT Group 4 decompression for bit maps

==========

Article Created: 13 January 1994

TOPIC ----------

I understand that PostScript Level 2 includes CCITT Group 4 decompression for bit maps. Is this true? Do any of the Apple printers support any CCITT decompressions?

DISCUSSION ----------

PostScript Level 2 does offer CCITT (now ITU-T) Group 3 and Group 4 encoding and decoding filters. PostScript language support for the ITU-T Group 3 and Group 4 standards is limited to encoding and decoding of image data. It does not include initial connection and handshaking protocols that would be required to communicate with a fax machine. The purpose of these filters is to enable efficient interchange of bi-level sampled images between an application program and a PostScript interpreter. For more information, please see pages 134 to 136 in the "PostScript Language Reference Manual, Second Edition" (ISBN 0-201-18127-4) from Addison-Wesley.

The LaserWriter Pro 810 and LaserWriter Select 360 have fax options that use the PostScript Level 2 ITU-T Group 3 encoding and decoding filters.

VT420 Emulation On Macintosh (1/94)

Revised: 1/19/94
Security: Everyone

VT420 Emulation On Macintosh (1/94)

==========

Article Created: 12 January 1994

TOPIC ----------

When can we expect VT420 support for the Macintosh? Will the Comm Toolbox (CTB) support this any time soon, or will this support come from third-party vendors?

DISCUSSION ----------

Here are some of the third-party products available now. For more information, please search the Redgate database on AppleLink using the string "VT420". To locate a vendor's address and phone number, use the vendor name as a search string on the Tech Info Library.

Vicom Pro by Vicom Technology

Vicom Pro provides a powerful communication development environment in which to create Macintosh front ends to corporate host systems. By using Vicom's unique interface editor in conjunction with Vicom's SuperScript language, applications can be created for use with Vicom RunTime and Vicom MultiTerm. Features include a project manager with run-time debugger, support for Publish and Subscribe, AppleEvents, AppleScript and XCMDs. Vicom Pro includes terminal emulations for SNA•ps 5250 and SNA•ps 3270, TN5250, TN3270, VT340 & VT241 (ReGIS), VT420, VT320, VT220, VT100/52, VIP7800 WP VIP7824, WYSE 60, WYSE 50, SCO ANSI, ANSI, TV1950, TV1925, DG410, DG211, MCG3101, Adds Viewpoint 50, TTY, Videotex Minitel/Teletel and Videotex Prestel. Connections can be made using Vicom drivers, TCP/IP, LAT, Apple's Communication Toolbox (CTB) connection tools and Serial. FTP Client and FTP Server are included.

asc420 by Sysnet Corporation
---

asc420 is a terminal emulation tool. It allows users to communicate with any computer that works with a DEC VT420 terminal and can be used by any communications application, such as 5PM, that works with the Communications

Toolbox. Full-featured key mapping lets users choose a character set for the keyboard and use DEC keys even if they do not appear on the Macintosh keyboard. Visual indicators are available to replace the indicators that usually appear on the DEC keyboard. These indicators show when the terminal is online, using local echo, pausing while users read text that is being written to the screen and waiting for the host.

SNA•ps Print and Postscript (1/94)

Revised: 1/19/94
Security: Everyone

SNA•ps Print and Postscript (1/94)

==========

Article Created: 12 January 1994

TOPIC -----

Is there anyway to print a PostScript document from a mainframe to a LaserWriter through the SNA•ps printer client? If so, what special configurations are needed on the mainframe, SNA•ps gateway, and SNA•ps printer client for this to work?

DISCUSSION -----

SNA•ps Print emulates an IBM 3287 or 3812 printer which supports LU3 (3270 data streams) or LU1 (SCS data streams) only. AS/400 printing is done only with LU1. The emulation is expecting to decode data (text only) within one of the mentioned data stream formats.

Therefore, SNA•ps Print is not a solution for printing Host based Postscript documents.

PowerBook: Problems with Express Modem & Prodigy (3/95)

Revised: 3/31/95
Security: Everyone

PowerBook: Problems with Express Modem & Prodigy (3/95)

==========

Article Created: 12 January 1994
Article Reviewed/Updated: 31 March 1995

TOPIC ----------

This article is to clear up two common problems PowerBook owners with Express Modems may report when using Prodigy.

DISCUSSION ----------

Prodigy Error CT#24 - Can't communicate with the modem.

This problem usually indicates that the customer is using an older version of the Express Modem software. The solution is to use Express Modem 1.1.2 software or later. (2.0 is the current version)

Prodigy Error CT#8 - Noisy phone line.

The problem lies in the 'connect' message that Prodigy is expecting once a connection has been established. It has nothing to do with a noisy phone line.

Due to the ATW2 default setting within the Express Modem, it reports a full connection message:

CARRIER 2400
PROTOCOL :NONE
COMPRESSION: NONE
CONNECT 2400

Prodigy expects just "CONNECT 2400" and will disconnect immediately.

To solve the problem, the modem setup string within the CONFIG.SM file needs to be modified. ":ATW0X1" needs to be appended to the modem_str line. For example:

modem_str:3615,0,,2400,+++,CR,CRLF,1,4,6,N,30,50,3,6,32,N,N,,?,

```
S0,,S2,,,,S6,S7,,S9,S10,,S12,,,,,,,,,V1,Q0,,,,X1,,D,T,P,X1,H,,,,,,,,,,,,,,,
OK,0,CONNECT,1,RING,2,NO CARRIER,3,ERROR,4,CONNECT 1200,5,
NO DIALTONE,6,BUSY,7,NO ANSWER,8,CONNECT 2400,10,,,,,,,,,:ATW0X1
```

The W0 command disables Progress codes 40 through 80 and the X1 command restricts the Express Modem in using only result codes 0 through 4 and 8. Refer to the Express Modem User's guide, pages 120-121 for complete details.

Article Change History:
31 Mar 1995 - Reviewed for technical accuracy.
09 Jun 1994 - Made correction to modem string.

Super ATM 3.5: Corrupts Desktop Rebuilding (11/94)

==========

Article Created: 12 January 1994
Article Reviewed/Updated: 17 November 1994

TOPIC ----------

After the Macintosh desktop file has been rebuilt, some Icons are generic, and some documents, which would open before, will now not open when I double click on them. If I click on a document and then "Get Info" on that document, the Get Info box tells me that the document is Type: 'Document'.

DISCUSSION ----------

According to Adobe, this is a problem with Super ATM 3.5 and has been fixed in later versions of Super ATM.

Super ATM 3.5 was installed before the last desktop rebuild. Adobe is aware of the problem, and recommends the following:

a. Reboot the Macintosh with Super ATM off (Extensions off works well for this)
b. Rebuild the Desktop file
c. Restart the Macintosh

This can be done all in one step (if the user is quick) by rebooting, and immediately holding down the shift key, until the 'Welcome to Macintosh, Extensions Off' message is seen. Let up on the shift key, and hold down on the Command-Option keys until the message to Rebuild the Desktop dialog is displayed.

Customers can call Adobe at 800-833-6687 for update information.

Performa 560: Specifications (1/94)

Revised: 1/13/94
Security: Everyone

Performa 560: Specifications (1/94)

==========

Article Created: 13 January 1994

TOPIC --------------------

This article gives technical specifications for the Macintosh Performa 560 computer.

DISCUSSION --------------------

Microprocessor

- MC68030, 33 MHz clock speed; 32-bit data bus
- Built-in memory-management unit
- Socket for optional MC68882 floating-point unit (FPU)

Memory

- 5MB RAM standard (4MB on logic board, 1MB in SIMM)
- Expandable (by authorized Apple dealer) to as much as 36MB by adding 1MB, 2MB, 4MB, 8MB, 16MB, or 32MB SIMM to a single 72-pin slot. Requirement: 72-pin fast-paged, 80ns or faster.
- 1MB ROM

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 160MB hard disk
- Internal AppleCD 300i double-speed CD-ROM drive

Video Display

- Integrated Macintosh Color Display with 14-inch Trinitron CRT
- Resolution: 640 x 480 pixels, 69 dpi
- 768K VRAM supports 32,768 colors (16-bit color)

Software

• System Software version 7.1P5
• Financial and productivity software installed on hard drive

Interfaces

• Internal expansion slot for one Macintosh LC processor-direct expansion card. Compatible with Apple IIe Card.
• SCSI interface for connecting up to five external peripheral devices
• Two serial (RS-232/RS-422) ports
• One stereo sound-output port for external audio amplifier or headphones
• Two Apple Desktop Bus (ADB) ports for keyboard, mouse, and other devices
• Front headphone jack
• Built-in electret microphone above display
• One sound-input port for four sources: internal or external microphone, internal CD-ROM, or external audio

Sound Generator

• Stereo 8-bit digital-analog conversion using 22-kHz sample rate - capable of driving stereo headphones or other stereo equipment through the sound jack and headphone jack
• Built-in stereo speakers

Keyboard and Mouse

• ADB Mouse II
• Apple Keyboard II

Clock/Calendar

• Custom integrated circuit with long-life lithium battery

Disability Access

• CloseView, Easy Access, and visible-beep software are built in.
• Third-party options provide alternative input and output devices

Power Requirements

• Line voltage: 90 to 264 V AC, RMS single phase, automatically configured
• Frequency: 47 to 63 Hz
• Power: 40 W maximum, not including display
  60 W maximum, including display
• Energy-saving feature reduces power consumption by 50%
• One AC outlet powers computer, display, drives, and speakers

ADB Power Requirements

• Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum is recommended)

• Mouse draws 10 mA
• Keyboard draws 25 to 80 mA, depending model used

Size and Weight

Main unit:
• Height: 17.9 in. (45.5 cm)
• Width: 13.5 in. (34.4 cm)
• Depth: 16.5 in. (42.0 cm)
• Weight: 40.5 lbs (18.4 kg)

Mouse:
• Height: 1.3 in. (3.3 cm)
• Width: 2.4 in. (6.2 cm)
• Depth: 4.2 in. (10.7 cm)
• Weight: 4.0 oz. (0.10 kg)

Keyboard:
• Weight: 2.2 lb. (1 kg)
• Height: 1.8 inches (44 mm)
• Width: 16.5 inches (418 mm)
• Depth: 5.6 inches (142 mm)

Operating Environment

• Operating temperature: 50 to 104° F (10 to 40° C)
• Storage temperature: –40 to 116.6° F (–40 to 47° C)
• Relative humidity: 20% to 85% noncondensing
• Maximum altitude: 15,000 ft. (4,722 m)

Apple Hardware: FCC Compliance (1/94)

Revised: 1/14/94
Security: Everyone

Apple Hardware: FCC Compliance (1/94)

==========

Article Created: 14 January 1994

TOPIC ----------

Does the Centris 650 and the Quadra 650 have a FCC rating "A".

DISCUSSION ----------

No, the Centris 650 and Quadra 650 as well as nearly all Apple Computers meet the more stringent FCC Class B certification. Class B devices emit so little EMI that they can be used in homes whereas Class A devices are generally noisier and, therefore, can be used only in a work environment, where there is less likelihood of products interfering with radio and television reception.

Devices certified by the FCC contain a label that specifies the type of certification. Per FCC regulations, Class A and Class B devices must contain a label that reads:

> This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

To determine whether an Apple product (except for LaserWriters) is Class B compliant, in addition to the label having the above passage, on the same label, molded into the housing, or on a separate label will appear a FCC ID number. Therefore, if you see a FCC ID number on a product, that product is class B compliant; if there is no additional FCC ID number, it is Class A.

An example of the FCC ID number is the FCC ID for the Macintosh LC II: FCCID BCGM1700.

Note that Apple requests LaserWriter logic boards be certified, and not the

engines; therefore, the Class B FCC ID number will appear on the logic board, and not the housing.

One other location to verify a products' FCC certification is the documentation that accompanies the product. We have more flexibility in how that message may read, and Apple typically states whether the product is Class A or B compliant.

TITLE

Macintosh: Startup Problems Q & A

Article ID: 14438
Created: 1/14/94
Modified: 1/11/00

TOPIC

This Q & A article addresses frequently asked questions (FAQ) on Macintosh startup problems.

DISCUSSION

Note: Before troubleshooting the following problems, remove any unnecessary external peripherals such as joysticks, disk drives, and the like.

Question: When trying to start my computer, I hear a noise like breaking glass.

Answer: The breaking glass sound indicates a hardware issue, typically memory related. You may follow steps 5 and 6 in the following Answer section to troubleshoot this issue.

Question: Whenever I start my computer I hear the normal startup chord and then it plays a series of musical notes? I have heard a series of both four and eight beeps.

Answer: This indicates a problem during startup. Try the following:

1. Shut the computer down.

2. Insert your Disk Tools disk or system software CD in the appropriate drive and restart the computer.

3. Recall if it is four or eight beeps you heard.

4. If your heard four beeps and they do not play when booting off the Disk Tools disk or CD, then the problem is usually software related. Eject the CD or disk and restart your computer pressing the Shift key. If the computer starts up normally, there is likely to be an extension conflict causing the problem. Read TIL article 30929: "**Mac OS 8.x: Extensions Troubleshooting/Extensions Manager Features**". If the beeps persist, it is likely that your system software is corrupted and you should perform a clean installation to resolve the issue.

5. If eight error beeps are played, this indicates a possible problem with the memory. If you have additional memory installed, remove it. If the problem goes away, the memory expansion is likely to be bad and should be replaced.

6. If, after all the above troubleshooting, the problems persist, your computer should be taken to an Apple-authorized service provider who can perform additional diagnostic tests to determine the exact cause of the problem.

Question: What do I do if the Desktop is rebuilt every time I start the computer?

Answer: Double-click on the hard drive icon to enable you to view its contents. If there is a folder called Desktop or Desktop Folder, change its name by clicking on the folder name and typing in a new name, or deleting the folder(s). This folder is normally created while transferring files using File Sharing.

Question: Why do I get a flashing question mark (?) every time I start my computer?

Answer: The flashing question mark can indicate either a software or hardware problem. Try the following steps to narrow down the likely cause. If your computer does not have a floppy drive, follow the same steps substituting your Mac OS system software CD for the Disk Tools floppy disk.

1. When you get the flashing question mark during startup, put the Disk Tools disk in the floppy drive and restart the computer, allowing the Macintosh to startup (boot) from the floppy drive. If the computer starts up normally and you can open the hard drive, then the problem is with your system software. A reinstallation of system software (clean installation) should solve the problem.

2. If the hard drive is not visible on the desktop launch Apple HDSC Setup, or Drive Setup program (which is located on the Disk Tools Disk) and scan the hard drive. Please note, Apple HDSC Setup will not function properly if the Apple hard disk has been formatted by a non-Apple drive utility.

If HDSC Setup can locate the drive, try to update and test the drive. If the drive doesn't mount (and you have a backup of the drive) then reformat the drive by clicking on the Initialize button. Please note, that if you use the initialize button, everything on the drive will be erased and cannot be recovered. Initializing the drive should enable the drive to mount to the desktop. Next, you will need to reinstall system software.

If HDSC Setup can't locate the drive, and you haven't formatted the drive with non-Apple software, this may indicate possible hardware failure.

Question: What do I do if my icons all look generic (documents are blank with a folded down corner and applications are diamonds with a hand), or when I double-click a document it says the application that created it cannot be found?

Answer: This is normally a sign of a corrupted Desktop file. The Desktop database contains information about all files on your hard disk, including the icon associated with the file. Over time, it can become corrupted and fail to associate the proper icon with the file. Rebuilding the desktop usually fixes the problem.

To rebuild the desktop, restart your computer and hold down the Command (open Apple) and Option key. Hold them down until you get the message "Are you sure you want to rebuild the desktop file?" Let go, and click OK. If this fails, perform a clean installation of system software and rebuild the desktop again.

Question: When I start my computer, it starts up to the desktop, but the cursor keeps flashing between the arrow and the watch. What should I do?

Answer: This is normally caused by having too many windows open or too many items in an open window. Try the following:

1. Shut down and turn off the computer.

2. Restart the computer. Immediately after hearing the startup chime, press the Option key and continue to hold it until the screen shows the desktop and all the menus are available. This closes all open windows.

Question: When my computer is booting up, I notice the mouse pointer is frozen while the Welcome to Macintosh screen is displayed. The computer goes no further. What can I do?

Answer: This is normally caused by an extension conflict during startup. Try the following:

1. Power the computer off.

2. Restart the computer and hold down the shift key until you see the message Welcome to Macintosh, Extensions off.

3. If the computer starts normally with extensions off, the problem is likely tied to an extension. If you recently installed a new extension, try removing it and restart. TIL article 30929: "**Mac OS 8.x: Extensions Troubleshooting/Extensions Manager Features**" can help you to troubleshoot an extension issue using the Extensions Manager control panel.

4. If the problem persists after troubleshooting your extensions, you may need to reinstall system software. A clean installation would be recommended so that you get a fresh copy of the system software.

Question: Whenever I start my computer, it tells me that I need a newer version of system 7.1. I have system 7.1 on my computer. What is the problem?

Answer: This message is displayed on Macintosh computers that require a system enabler. If the system enabler has been moved out of the system folder this message will appear. Try the following:

1. Shut down the computer.

2. Put the Disk Tools Disk, or the system software CD that came with your computer and restart. You must use the Disk Tools or

CD because it contains the proper enabler.

3. When the computer starts up, use Find File to search your hard disk for the system enabler. If it is found, move it into the system folder. If the enabler is missing, drag a copy of the enabler from the system folder on the Disk Tools Disk or system software CD.

4. Restart the computer. If it still fails, then system software corruption is likely. A clean installation of system software should resolve the problem.

In addition to the previous suggestions, you may install Mac OS version 8.0 or higher. The system enabler technology was removed beginning with this version of the Mac OS.

Macintosh: Startup Problems Q & A (5/95)

==========

Article Created: 6 January 1994
Article Reviewed/Updated: 9 May 1995

TOPIC ----------

This Q & A article addresses frequently asked questions on Macintosh startup problems.

DISCUSSION ----------

NOTE:

In resolving the following problems make sure there is nothing more than the power cord and floppy drive (if needed) plugged into the computer. Please disconnect all other devices.

Question: What do I do if the Desktop is rebuilt every time I start the machine?

Answer: Double-click on the Hard Drive Icon. If there is a folder called Desktop or Desktop Folder, change its name by clicking on the folder name and typing in a new name. This is normally created while transferring files using File Sharing.

Question: Why do I get a flashing "?" every time I start my machine?

Answer: The flashing question mark usually indicates either a software or hardware problem. Try the following steps below.

1) When you get the flashing question mark during startup, put the Disk Tools disk in the floppy drive and restart the Macintosh, allowing the Macintosh to startup (boot) from the floppy drive. If the computer starts up normally and you can open the hard drive, then the problem is with your system software. A reinstallation of System software (clean installation) should solve the problem.

2) If the hard drive is not visible on the desktop launch the Apple HDSC Setup program (which is located on the Disk Tools Disk) and scan the hard drive. Please note, Apple HDSC Setup will only function properly with an Apple drive which has not been reformatted by a non-Apple formatter.

If HDSC Setup can locate the drive, try to update and test the drive. If the drive doesn't mount (and you have a backup of the drive) then reformat the drive by clicking on the Initialize button. Please note, that if you use the initialize button everything on the drive will be erased and cannot be recovered. Initializing the drive should enable the drive to mount to the desktop. Next, you will need to install system software.

If HDSC Setup can't locate the drive, and you haven't formatted the drive with non-Apple software, this may indicate possible hardware failure.

Question: What do I do if my icons all look generic (documents are blank with a folded down corner and applications are diamonds with a hand) or when I double-click on a document it says the application which created it cannot be found (but I know the application is there)?

Answer: This is normally a sign of problems with the Desktop file. Restart your computer and hold down the Command (open Apple) and Option key. Hold them down until you get the message "Are you sure you want to rebuild the desktop file?" Let go, and click on "OK". If this fails, then do a clean System 7 Reinstallation (as given in the Fax Info System) and then rebuild the desktop. Most likely an extension is causing the failure in the Desktop file.

Question: What do I do if whenever I start my computer I hear the normal startup chime and then it plays a series of musical notes?

Answer: Unless a friend has put an alias of Beethoven Ninth in your startup items folder, this indicates a problem during startup. Try the following:

1) Shut the computer off for 5 seconds.
2) Put your Disk Tools disk in the drive and restart the computer again.
3) Listen for the chimes and count if it is four or eight tones.
4) If the chimes go away booting off the Disk Tools disk then the problem is usually software related. Performing a clean System Software installation should solve the problem.
5) If four tone error chimes persist this normally indicates a possible problem with the hard drive. Try using Disk First Aid 7.2. If that doesn't work try using a third party recovery disk to recover the drive.
6) If eight tone error chimes persist, this indicates a possible problem with the memory. If you have a memory expansion installed, remove it. If the problem goes away, the memory expansion may be bad and may need replacing.

Question: When I start my computer, it starts up to the desktop, but the cursor keeps flashing between the arrow and the watch. What should I do?

Answer: This is normally caused by having too many windows open or too many items in an open window. Try the following:

1) Power off the computer.
2) Restart the computer. Immediately after hearing the startup chime, hold down the "option" key and continue to hold it down until the screen shows the desktop and all the menus are available. This closes all open windows.

Question: My computer stops working and just sits there "frozen" during the "Welcome to Macintosh" screen. What can I do?

Answer: This is normally caused by an extension or init conflict during startup. Try the following:

1) Power the computer off for at least five seconds.
2) Restart the computer and hold down the shift key until you see the message "Welcome to Macintosh, Extensions off".
3) If the unit starts normally with extensions off, try removing the last extension you added and restart. Or, do a clean system 7 installation (as described in the Fax Info system).
4) If the computer hangs, power it off again and startup off of Disk Tools Disk. If it works, continue with a clean system 7 installation as described in the Fax Info system.

Question: Whenever I start my computer, it tells me that I need a newer version of system 7.1. I have system 7.1 on my computer. What is the problem?

Answer: This message is displayed on Macintosh computers which require a System enabler. (Not a Powerbook 100,140,145,145b or 170). If the system enabler has been moved out of the system folder this message will appear. Try the following:

1) Power the computer for five seconds.
2) Put the Disk Tools Disk in the Floppy drive and restart. You must use the Disk Tools because it contains the proper enabler on it.
3) When the computer starts up look on your hard drive for the system enabler. Move it into the system folder along with any other items which may have been removed. If the enabler is missing, drag a copy of the enabler from the system folder on the Disk Tools Disk .
4) Restart the computer. If it still fails, then something else is wrong. A clean system software reinstallation is needed.

Question: Sometimes when I start my computer, I get the normal startup chime and then the chime repeats and everything starts normally. If this supposed to happen?

Answer: This is normally a result of a non-Apple utility designed to change a setting while running off battery. If you have a PowerBook Utility program installed, check your manual or call the vendor for support. The restarting feature will normally continue even when booting off the Disk Tools Disk.

Question: I have intermittent problems with my computer. How can I determine if the problems are hardware or software?

Answer: In general, software problems will go away if you start up with extensions off (by holding down the "Shift" key during startup, or by booting off the Disk Tools Disk.) If either of these solves the problem, follow with a clean System 7 installation

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

AV Serial Extension: Fixes 660AV Serial Printing Problems (1/94)

Revised: 1/17/94
Security: Everyone

AV Serial Extension: Fixes 660AV Serial Printing Problems (1/94)

==========

Article Created: 17 January 1994

TOPIC----------

I'm using a 660AV with a LaserWriter Select 310 and a Geoport. The printer does not work. It works with any non-AV Macintosh, but when connected to any AV Macintosh it does not work.

DISCUSSION ----------

The extension to fix the 660AV serial printing problems (AV Serial Extension) has been released for everyone. It is the official tested solution and can be given to people for 660AV/serial connection problems, especially LaserWriter Select 310 printing problems.

I have tested with this extension, and a document which consistently failed when printed to a LaserWriter Select 310 from the 660AV, now prints completely with no problem. I tested with:

- Virtual Memory and Voice Recognition both OFF
- Voice Recognition ON
- Virtual Memory and Voice Recognition both ON In all three cases the 660AV printed with no problem from the Printer Port.

The extension "AV Serial Extension (1.0)" is available on AppleLink via the path:

AppleShare 3.0: Sharing CDs with AppleShare (1/94)

Revised: 1/17/94
Security: Everyone

AppleShare 3.0: Sharing CDs with AppleShare (1/94)

==========

Article Created: 17 January 1994

TOPIC -----

I have a server running AppleShare 3.0 with a CD ROM Drive attached. I want to share various CD discs, how do I do this?

DISCUSSION -----

A new CD can be shared by simply inserting it into the CD ROM drive. The new disc will automatically be mounted on the desktop and made sharable to AppleShare if it was previously a shared CD (on that server). If the CD had never been shared previously, the CD will mount on the desktop, but you will have to share it via AppleShare Admin. After that, simply dragging the CD to the trash to unmount it, and then inserting it again, will cause it to automatically mount and become sharable with the same privileges as it had previously.

Japanese Language Kit: Furigana Support (2/95)

Revised: 2/22/95
Security: Everyone

Japanese Language Kit: Furigana Support (2/95)

==========

Article Created: 19 January 1994
Article Reviewed/Updated: 22 February 1995

TOPIC -----

Does the Japanese Language Kit support Furigana (small Kana written next to an unusual Kanji as a guide to its pronunciation), or is that something that would have to be "faked" by adding a very small line above the normal one?

DISCUSSION -----

Furigana is supported by a number of localized products. We know that TurboWriter, EGWord, and Nisus supports Rubi/Furigana, and we believe that MacWrite II-J, WordPerfect-J, PageMaker-J, Quark Express-J, etc., may support this feature too.

We feel that "faking" Furigana by adding an extra line above your line of text is a poor solution because the Furigana needs to be anchored to its associated text.

For additional details on third party Japanese Language Kit products, contact a Japanese Language Kit dealer in your area, or contact a third party software vendor, such as, SystemSoft.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Japanese Language Kit: User Defined Characters (3/95)

Revised: 3/3/95
Security: Everyone

Japanese Language Kit: User Defined Characters (3/95)

==========

Article Created: 19 January 1994
Article Reviewed/Updated: 3 March 1995

TOPIC ----------

Does the Japanese Language Kit have any support for adding characters to the list of recognized characters?

For instance, if someone were to spell their name with an unusual Kanji character that the program does not already have, can the Japanese Language Kit add that Kanji itself or would an outside font editor be necessary?

DISCUSSION ----------

Depending on the nature of the kanji being used, Chapter 5 of the Japanese Language Kit Input Guide ("Using Dictionaries") may provide a solution. Otherwise see below:

When we introduced Kanji TrueType, we had to drop User Gaiji (user defined characters), because of the complexity of adding them to the outline fonts.

To our knowledge, the only program that produces User Gaiji is a 3rd party package from Enfour that patches the fonts: though we don't have a lot of details on this product.

For additional details on third party Japanese Language Kit products, contact a Japanese Language Kit reseller in your area, or call SystemSoft.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number, such as Enfour or SystemSoft.

Article Change History:
03 Mar 1995 - Added reference to information in the manual.

Performa 550: Troubleshooting Blank Gray Display (1/94)

Revised: 1/17/94
Security: Everyone

Performa 550: Troubleshooting Blank Gray Display (1/94)

==========

Article Created: 17 January 1994

TOPIC ----------

My Performa 550 is displaying a blank gray screen.

DISCUSSION ----------

If your Performa 550 is displaying a blank gray screen, you need to eject the CD (or CD-ROM) that's in the drive. Here's how:

1) Insert a paper clip or similar slender straight tool into the small hole located just below, and to the right of, the CD door. Press slowly and firmly until the CD ejects.

2) If this doesn't work, raise the door marked "caddy loaded" straight up. Here's how: With the computer's power on, "walk" the door up with your fingers. Press in and up on the two corners of the CD caddy and it will pop out.

3) Once the CD has ejected, hold down hold down three keys simultaneously:
   the Control key at the bottom left of the keyboard,
   the Command key (located next to the space bar), and
   the Power key located at the top of the keyboard.

   Hold all three for about one second and let go. Your Performa will restart.

4) If you see a message that your Performa was not shut down properly, press the Return key on your keyboard. If you do not see this message, select Restart from the Special menu.

Apple Basic Color Monitor & LCD Displays: Cabling Tips (1/94)

Revised: 1/17/94
Security: Everyone

Apple Basic Color Monitor & LCD Displays: Cabling Tips (1/94)

==========

Article Created: 17 January 1994

TOPIC ----------

I have a Macintosh LC III and an Apple Basic Color Monitor, which are hooked up to an LCD projection panel. The LCD is displaying a great picture, but the picture on the Apple Basic Color Monitor is awful. (The Basic Color Monitor works fine when connected to the computer by itself.)

DISCUSSION ----------

All Macintosh computers with built-in video (except for the Macintosh IIci and IIsi) automatically sense what kind of monitor is attached, and adjust the video signal accordingly. In the case of the Apple Basic Color Monitor, the computer will sense a VGA monitor and send out a VGA signal.

Although most LCD panels work with both RGB and VGA video signals, the different signals require different cables.

If you connects an LCD panel using the cable labeled for Macintosh, the computer will sense an RGB monitor and send out an RGB signal. This signal works fine with the LCD panel, but is not compatible with the Apple Basic Color Monitor.

Use the cable labeled for use with VGA monitors when connecting an LCD panel to a computer with the Apple Basic Color Monitor. Disconnect the VGA adapter from the Apple Basic Color Monitor and use it to connect the LCD panel cable directly to the computer.

TITLE

PowerBook and iBook: Resetting Power Manager

Article ID: 14449
Created: 1/18/94
Modified: 1/4/00

TOPIC

What is the Power Manager and is there a proper way to reset it for each type of PowerBook computer?

DISCUSSION

The Power Manager is an integrated circuit that is usually on the logic board of the PowerBook and iBook. As the name implies, it is responsible for power management of the PowerBook. It controls backlighting, hard disk spin down, sleep and wake, some charging aspects, trackpad control, and I/O as far as looking at the serial port and modem so it doesn't sleep when connected.

Over time, the settings in the Power Manager may become corrupted, which can result in operational anomalies with the PowerBook. Examples would be not powering on, not waking from sleep, not charging the battery, or not seeing the AC Adapter, among others.

Resetting the Power Manager is accomplished in a variety of ways depending upon the specific PowerBook model in use. These methods are described below.

WARNING: Resetting the Power Manager on any PowerBook computer will permanently remove a RAM disk, if present, and all of its contents.

PowerBook 100

1. Remove the AC adapter and the battery.
2. Flip the battery contact switch on the rear of the unit to the down position.
3. Let the unit sit without power hooked up for 3-5 minutes.
4. Simultaneously press and hold the rest and interrupt buttons on the side of the unit for 15 seconds.
5. Reinstall the battery, reconnect the AC adapter if necessary and flip the battery contact switch on the rear of the unit to the up position.

PowerBook 140, 145, 145 B and 170

1. Remove the AC Adapter and the battery.
2. Let the unit sit without power connected for 3-5 minutes.
3. Using two paper clips, simultaneously press and hold the reset and interrupt buttons for 5-10 seconds.
4. Reinstall the battery and, if necessary, reconnect the AC adapter.

Note: Both recessed buttons (commonly known as the reset and interrupt buttons) are located next to the power button on the back panel of the PowerBook.

PowerBook 150

1. Remove the power adapter and battery from unit.
2. Push the reset button in the back of the unit with a paper clip and hold for 5-10 seconds.
3. Plug the AC adapter into the AC (wall) outlet.
4. Reconnect the power adapter and push the reset button in back again, but just briefly. You should hear a small pop from the speaker; do not be concerned.
5. Push main power button in back (large exposed button). The unit should power up.
6. Apple suggests charging the battery for at least 8 hours before running on battery power.

If the PowerBook powers on, the battery may be reinserted. If it fails to start, the PowerBook may require service.

PowerBook 160, 165, or 180

1. Remove the AC adapter and the battery.
2. Let the unit sit without power connected for 3-5 minutes.
3. Reinstall the battery and, if necessary, reconnect the AC adapter.

Note: Steps 1 and 2 will usually reset the Power Manager, however if the computer still exhibits the same problem, redo steps 1 and 2 and then follow the step listed below before reinstalling the battery.

1. Using two paper clips, simultaneously press and hold down the reset and interrupt buttons for 5-10 seconds. They are located next to the power button on the back panel of the PowerBook.

PowerBook 500 series

1. Remove the AC adapter and the battery.
2. Let the unit sit without power hooked up for 3-5 minutes.
3. Simultaneously press and hold Command-Option-Control-Power On for 5-10 seconds.
4. Reinstall the battery and, if necessary, reconnect the AC adapter.

PowerBook 200 and 2300 Series

1. Press and hold the power button on the rear of the 200 or 2300 series computer for 30-45 seconds.*

2. **(see Caution)** If resetting the Power Manager chip does not solve the problem, reset the code for the Power Manager chip by removing all power sources and letting the unit sit for 10 minutes. (Disconnect the AC adapter, remove the battery and the internal backup battery.) This forces the PowerBook Duo to reload the Power Manager code from the system software.

****Caution**** Apple-authorized service technicians may remove the internal back up battery to reset the Power Manager. If you are not an Apple-authorized service technician, please note that removing the internal backup battery is not a simple procedure and is not recommended. If anything is damaged in your attempt to remove the battery, it will not be covered under warranty.

PowerBook 190, 1400, 2400, 3400, 5300 Series, and PowerBook G3 (M3553):

The PowerBook 190, 1400, 3400, 5300 Series, and PowerBook G3 (M3553) have two different ways to reset the Power Manager. The only difference is the location of the reset button. See the table below for the location of the reset button on each PowerBook series.

PowerBook	Reset Button Location (on rear of computer)
190 Series	Below the video-out port
1400 Series	Between the ADB and Serial ports
2400 Series	Above the floppy drive connector
3400 Series & PowerBook G3 (M3553)	Left of the Serial port
5300 Series	Below the video-out port

Resetting the Power Manager

1. If the computer is on, turn it off.
2. Restart the computer by holding down the reset button for 10-20 seconds. (See chart above for location of the reset button for your PowerBook series.)
3. If the computer does not restart, repeat step 2 three or four times.

Resetting the Power Manager and PRAM

Resetting, or zapping, the parameter RAM (PRAM) when the computer is shut down also resets Power Manager. The following process resets both the Power Manager and the parameter RAM.

1. If the computer is on, turn it off.
2. Make sure the Caps Lock key is not down.
3. Restart the computer. Immediately after hearing the startup sound, simultaneously press and hold Command-Option-P-R. (If you do not hold down the key combination within 5-10 seconds after the computer restarts, you will need to repeat steps 1-3.)
4. Hold down the keys until you hear the startup sound again. Then release the keys.
5. If the computer shuts itself off, press the reset button on the back of the computer to turn it back on. (See chart above for location of the reset button for your PowerBook series.)
6. When the computer has finished starting up, restore any custom settings for the desktop pattern, memory, network, AppleTalk, trackpad, power conservation, and so forth.

PowerBook G3 Series (M4753)

1. If the computer is on, turn it off.
2. Simultaneously press Shift-Fn (function)-Ctrl (control)-power.

3. Wait 5 seconds.
4. Press the power button to restart the PowerBook.

PowerBook G3 Series (Bronze Keyboard) (M5343)

1. If the computer is on, turn it off.
2. Press the reset button on the rear of the computer. The reset button is located between the external video and modem (RJ-11) ports.
3. Wait 5 seconds
4. Press the power button to restart the PowerBook.

Note: When you reset the Power Manager, wait at least 5 seconds before using the power button to start up the computer. If you do not wait at least 5 seconds, the reset procdure may become corrupted. (If you suspect that the reset procedure was corrupted, press the reset button again and wait 5 seconds before pressing the power button.)

iBook

1. If the computer is on, turn it off.
2. Press the reset button located above the power button at the base of the display. You will need a small, blunt instrument such as a paper clip to press the button.
3. Wait 5 seconds
4. Press the power button to restart the iBook.

Note: The power manager reset on the iBook also resets the Date and Time. After the reset, the system clock will be set to 12:00 A.M., 01/01/1904.

DayStar Digital: nPOWER - PowerPC Coprocessor Card (3/94)

Revised: 3/11/94
Security: Everyone

DayStar Digital: nPOWER - PowerPC Coprocessor Card (3/94)

==========

Article Created: 18 January 1994
Article Reviewed/Updated: 11 March 1994

TOPIC ----------

This article describes the nPower PowerPC Coprocessor Card for selected Macintosh Models from DayStar Digital. The nPower card differs from other PowerPC upgrades in that multiple PowerPC chips can be added to a single card, accelerating important functions in image processing software.

DISCUSSION ----------

DayStar Digital has licensed core system-level ROM code from Apple. DayStar's nPower PowerPC Coprocessor Card will connect to the Processor Direct Slot (PDS) on the following Macintosh models:

- Macintosh Centris 650.
- Macintosh Quadra 650, 700, 800, 900, 950.

The rest of this article details the card's specifications. The card is expected to ship upon the official introduction of Apple first PowerPC based Macintosh models.

nPOWER PowerPC Coprocessor Card

Processor

- 66 MHz or 80 MHz clock speed option
- 64-bit data bus
- 32-bit address bus
- Mother board interface:
  - Processor Direct Slot (PDS) with proprietary multiplexed pipeline data path processor.
- Processor performance:
  - SPECint92 >60 (integer)
  - SPECfp92 >80 (floating point) at 66 MHz

Processor Cache

- Built in 32 Kbyte unified instruction and data cache
- Optional write-back mode

Memory

- 2 banks with two 72-pin SIMM slots each for a total of four.
- SIMM sizes: 1M x 32, 2M x 32, 4M x 32, 8M x 32.
- RAM speed: 60 ns (nanoseconds) or faster.
- RAM Type: non-parity or parity (parity is not used)

Memory Configurations

- Capacity range: 0 MB to 128 MB
- on board configurations: 0 MB, 8 MB, 16 MB, 27 MB, 32 MB, 40 MB, 48 MB, 64 MB, 72 MB, 80 MB, 96 MB, 128 MB, 0 MB

Memory Data Transfer Rates

- With interleaving: 92 MB per second reads, 118 MB per second writes.
- Without interleaving: 76 MB per second reads, 92 MB per second writes.
- Data transfer modes: 64-bit cache line transfers
- Data transfer rates: 20 MB per second and higher, depending on host platform.
- Power consumption: 3.0 amps at 5V (with 8 MB of RAM)

Software

- nPOWER Control Panel (CDEV)
- Adobe PhotoShop 25 nPOWERed extension

Environmental Conditions

- 50 to 104 degrees F (10 to 40 degrees C)
- Humidity: 10 to 80 percent (non-condensing)
- Altitude: Sea level to 10,000 feet.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

PowerPro 601: PowerPC Processor Upgrade Card

Processor

- 66 MHz or 80 MHz clock speed option
- 64-bit data bus
- 32-bit address bus
- Mother board interface:
  - Processor Direct Slot (PDS) with asynchronous communications interface.
- Processor performance:
  - SPECint92 >60 (integer)
  - SPECfp92 >80 (floating point) at 66 MHz

Processor Cache

- Built in 32 Kbyte unified instruction and data cache
- Optional 512 KB second L2 cache

ROM

- Apple PowerPC licensed ROMs

Memory

- 2 banks with two 72-pin SIMM slots each for a total of four.
- 1M x 32, 2M x 32, 4M x 32, 8M x 32.
- RAM speed: 60 ns (nanoseconds) or faster.
- RAM Type: non-parity or parity (parity is not used)

Memory Configurations

- Capacity range: 0 MB to 128 MB
- on board configurations: 0 MB, 8 MB, 16 MB, 27 MB, 32 MB, 40 MB, 48 MB, 64 MB, 72 MB, 80 MB, 96 MB, 128 MB, 0 MB

Memory Data Transfer Rates

Duo Dock: Multiple Hard Drives May Not Spin Up (5/95)

Revised: 5/31/95
Security: Everyone

Duo Dock: Multiple Hard Drives May Not Spin Up (5/95)

==========

Article Created: 19 January 1994
Article Reviewed/Updated: 31 May 1995

TOPIC ----------

When inserted into a Duo Dock or Duo Dock II+, my PowerBook 200 series computer does not start up from its internal hard drive. The Dock contains its own hard disk, math coprocessor, and VRAM.

DISCUSSION ----------

This issue seems to occur only when specific conditions are present. It can affect all members of the PowerBook 200 family, as well as other Macintosh computers with two hard drives connected either internally or externally.

The conditions that can cause the problem include:

• The PowerBook 200 series (Duo) computer and Duo Dock hard drives have been formatted with different versions of HD SC Setup.

• Enough VRAM is installed to allow the option of thousands of colors when the PowerBook 200 series computer is inside the Dock (unless thousands of colors are selected, the problem does not occur).

• 32-bit addressing is on

It can also occur with an external hard drive connected to the Dock, or if a third party drive is installed inside the Duo Dock or Duo Dock II+. In this case, reformatting both the PowerBook 200 series computer and the Dock drives with the appropriate formatter is required. Because Apple HD SC Setup does not recognize third party drives, you need to use a third party formatter.

To correct the problem, remove one of these conditions:

• Use HD SC Setup 7.2.2 or later to update the drivers on both hard drives. This is available from authorized dealers or online services.

• Reformat the PowerBook 200 series computer's internal hard disk with Apple HD SC Setup 7.1, or reformat both the Duo's internal hard disk and the Dock's hard disk with the same version of Apple HD SC Setup.

• Turn 32-bit addressing off.

• When starting up from the Dock, set the colors to 256 instead of thousands.

This article was published in the "Information Alley":
Volume II, Issue 3, Page 14

Article Change History:
31 May 1995 - Added Info Alley information; updated to reflect Duo Dock II+.
23 May 1995 - Changed title to specify product.
06 Apr 1995 - Noted internal 3rd party drive in Dock could cause issue.

HyperCard 2.2: Common Support Questions (1/94)

Revised: 1/19/94
Security: Everyone

HyperCard 2.2: Common Support Questions (1/94)

==========

Article Created: 19 January 1994

TOPIC --

This article, provided by Heizer Software, answers some common support questions that have come to Heizer since the introduction of HyperCard 2.2.

DISCUSSION --

Color

Q. Are the new Color Tools the same XCMDs as ColorizeHC?
A. No, they're entirely new XCMDs.

Q. How can I display color icons with HyperCard 2.2?
A. You can't. Color Tools supports the display of color picture resources (and files), but not icons. If you're comfortable with ResEdit, you can open the icon resource, select it, copy it to the clipboard, then create a new PICT resource and paste it in. You can then use Color Tools to display the new PICT resource.

Q. Why is color so slow?
A. Color is often slower, compared to monochrome, but here are several ways you can improve performance:
- In the OpenCard handler, set both lockmessages and lockrecent to true.
- Consider designing a single color background image, rather than colorizing several individual objects.
- Increase HyperCard's memory partition.

Visual Effects

Q. Why don't my visual effects work?
A. You've probably turned on Color Tools, which has its own visual effects. Either use Color Tools' visual effects, or turn Color Tools off.

Standalone Applications

Q. When I save as standalone, the color I added doesn't show up.
A. Increase the memory partition for your standalone (via the Get Info... command in the Finder) by at least 75K.

Memory

Q. Does HyperCard 2.2 require more memory than 2.1?
A. Yes, about 50K more -- primarily to support the new AppleScript features. If you haven't installed AppleScript, you probably don't need any more RAM than you did with HyperCard 2.1.

Compatibility

Q. Can HyperCard 2.1 open a HyperCard 2.2 stack?
A. Yes, both versions can read each other's stacks. However, new features of HyperCard 2.2 -- such as pop-up menus and AppleScript scripts, as well as some of the new language syntax -- will be unknown to HyperCard 2.1 and could cause script error messages.

Q. Will my XCMDs work under HyperCard 2.2, or do I need updates from the authors?
A. At Heizer Software, we have yet to find any XCMDs that worked under 2.1 but fail under 2.2. The XCMD interface is unchanged (other than bug fixes). Existing XCMDs should work just fine with the new version of HyperCard.

Other

Q. Why does the pop-up menu in the Save A Copy dialog list some menu items twice?

A. Because you've placed the StackToApp component in both your System folder and in HyperCard's folder. It should be in only one of those two places.

Newton Connection Kit for Windows: Missing AM/PM (1/94)

Revised: 1/19/94
Security: Everyone

Newton Connection Kit for Windows: Missing AM/PM (1/94)

==========

Article Created: 11 January 1994

TOPIC -----

When I open my Newton Connection Kit for Windows and edit my connection files, calendar items do not show up with the proper AM or PM designations.

Also, if I add an item to the calendar and type either AM or PM next to the time, the designation disappears when I close the item.

Why does this happen?

DISCUSSION -----

This situation is caused by the setup of the Connection Kit's time display formats. To display the time in standard 12 hour format with AM/PM designations, follow these steps:

1) Open the Windows Control Panel, then open the International Control Panel.
2) Select Change from the Time Format section of the control panel. This will display the Time Format dialog box.
3) Click 12 hour in the dialog box.
4) Enter AM next to the sample time 00:00-11:59 and enter PM next to the sample time 12:00-23:59 by clicking the up and down arrows next to the sample times.
5) Close the dialog box and control panels.

The connection files will now display the time with AM/PM designations.

Newton Messaging Card: In Box Limitation (1/94)

Revised: 1/19/94
Security: Everyone

Newton Messaging Card: In Box Limitation (1/94)

==========

Article Created: 11 January 1994

TOPIC -----

When a Newton Messaging Card that has received more than ten pages (or messages) is inserted into a Newton MessagePad, only the last 10 pages are shown in the MessagePad's In Box.

Why aren't the remaining pages displayed? Would adding more memory help?

DISCUSSION -----

Only the last 10 unread pages are shown in the In Box to conserve system memory for other tasks (such as handwriting recognition) and to reduce the memory overhead of maintaining the In Box.

Adding extra memory to the MessagePad will not help because the extra memory would be allocated to the user and not the Newton operating system.

To view the pages that are not shown in the In Box, open the Pager application in the Extras drawer.

Newton Messaging Card: How to Turn Off Alarm (1/94)

Revised: 1/19/94
Security: Everyone

Newton Messaging Card: How to Turn Off Alarm (1/94)

==========

Article Created: 11 January 1994

TOPIC -----

Does the Newton Messaging Card have a silent alarm so I can be notified when I receive pages (or messages) without an audible alarm?

Can I turn off the Newton Messaging Card (to avoid the audible alarm) and still receive pages?

DISCUSSION -----

Some paging devices can receive pages (or messages) after they are turned off. These devices vibrate to notify the user when they receive a page and do not produce an audible alarm.

The Newton Messaging Card cannot receive pages when it is turned off, and does not support vibrating notification. Its audible alarm can not be disabled while the unit is on.

The Messaging Card must be on to receive a page, but it does not need to be inserted into the Newton. To review pages that may have been sent to you while the Messaging Card was turned off, call the toll-free number in your Apple Wireless Messaging Service quick reference guide.

Video Monitor: Video Playthrough Displays White Screen (1/94)

Revised: 1/19/94
Security: Everyone

Video Monitor: Video Playthrough Displays White Screen (1/94)

==========

Article Created: 19 January 1994

TOPIC ----------

The video playthrough displays a white screen using Video Monitor on my AV Series Macintosh. When the screen first appears the video window flashes from black to white. Why is this happening?

DISCUSSION ----------

Generally, the white screen means that the video signal is stronger than the machine can accept. It is similar to the effect when one records music on a tape deck and the volume is maximized. In that case, the sound goes to a blur of noise. In the case of your AV Series Macintosh, the result is a white screen. The opposite is when there is no signal at all and the display is completely black.

If the VCR or Television has an option for changing the video level,(it may be labeled 'Attenuation On/Off') try setting it to a lower level.

As an alternative, try adjusting some of the Video Settings such as Saturation, Brightness, and so on. By tweaking those adjustments, he may be able to achieve a satisfactory solution.

AV Series: Software for Adjusting Video Brightness (1/94)

Revised: 1/19/94
Security: Everyone

AV Series: Software for Adjusting Video Brightness (1/94)

==========

Article Created: 19 January 1994

TOPIC -----

Is there is any software to adjust the video brightness for my
AV Series Macintosh?

DISCUSSION -----

Specific applications, such as VideoMonitor, Fusion Recorder, PhotoShop, or PageMaker, have software controls to adjust brightness. Currently, there isn't a general control panel or application to do this. However, most monitors and displays have contrast and brightness controls - either physical knobs or specific control panels.

AV, 68040 Macintoshes: Remote Application Launch Crash (1/94)

Revised: 1/19/94
Security: Everyone

AV, 68040 Macintoshes: Remote Application Launch Crash (1/94)

==========

Article Created: 19 January 1994

TOPIC ----------

Is there an incompatibility when launching applications or files on an AV Series Macintosh from a remote volume? My Macintosh crashes or hangs when doing so.

DISCUSSION ----------

The problem has been reported by users of AV Series Macintosh models as well as on other 68040 based Macintosh models which have had NSI (Network Software Installer) 1.4 or 1.4.1 updates installed.

The Network Launch Fix (1.0) is a system extension that allows you to successfully launch application programs over a network.

You should install the Network Launch Fix if you have a Macintosh computer with a 68O40 microprocessor. The 68040 microprocessor is included in Macintosh Quadra, Centris, and Performa 470 series computers.

Apple 16 Color Monitor & Centris 610: White Lines Fix (1/94)

Revised: 1/20/94
Security: Everyone

Apple 16" Color Monitor & Centris 610: White Lines Fix (1/94)

==========

Article Created: 20 January 1994

TOPIC --

I recently came across a customer who had a problem with his Centris 610/16" Apple Color Monitor which caused "white lines" to appear across the screen during scrolling (such as a word processor). The problem is repeatable, occurs only in 8-bit mode, and appears just after you start to scroll the document. It's so bad that you are unable to do any scrolling without corrupting the video display.

What is the fix for this problem?

DISCUSSION --

The problem to which you allude was corrected in System Update 2.0.1. Once it is installed, the 16" Apple RGB Display/Centris 610 will not exhibit the "white lines" when scrolling.

LaserWriter Pro 810 and Netware ATPS Print Services (1/94)

Revised: 1/20/94
Security: Everyone

LaserWriter Pro 810 and Netware ATPS Print Services (1/94)

==========

Article Created: 19 January 1994

TOPIC ----------

This article describes an problem when using the Apple LaserWriter Pro 810 with Novell's Netware ATPS Print Services.

DISCUSSION ----------

Novell's Netware ATPS Print Services is unable to make valid connections to the LaserWriter Pro 810 via the EtherTalk protocol. Presently you'll need to bind with IPX (or LocalTalk), not EtherTalk. Note this problem does not affect the Novell PSERVER Print Services.

Basically, the LaserWriter Pro 810's EtherTalk PAP arbitration is implemented differently than the LaserWriter Pro 630s and other printers. Though this implementation is not incorrect, merely different, it does cause problems with Novell's ATPS software as this software retries PAP connections with a new connection ID with every new print job instead of using the same connection ID, causing the LaserWriter Pro 810 to never get out of the arbitration stage. The ATPS console will show the printer as BUSY & IDLE at the same time.

It has been suggested that Netware ATPS administrators bind with Ethernet II (read Ethernet ii) instead of EtherTalk. We recommend you not bind the Ethernet II protocol as this protocol can only support AppleTalk Phase 1 packets. If you do bind Ethernet II intending to run AppleTalk Phase I, you'll need to place the server in -t (Transition mode) to translate the AppleTalk Phase II packets to AppleTalk Phase I and back, and place the LaserWriter Pro 810 on an AppleTalk Phase I cable segment.

Binding IPX (or using LocalTalk) is the preferred way to print to LaserWriter Pro 810s via the Netware ATPS queue.

Newton Messaging Card: Deleting Messages (1/94)

Revised: 1/20/94
Security: Everyone

Newton Messaging Card: Deleting Messages (1/94)

==========

Article Created: 11 January 1994

TOPIC --------------------

I have received a number of pages (or messages) on my Newton MessagePad with the Newton Messaging Card.

How do I delete more than one page at a time from my MessagePad?

DISCUSSION --------------------

One method to delete multiple pages (or messages) at a time is to find all pages before or after a specific date, then delete all of the pages you found. To do this, follow these steps:

1) Open the Pager application by tapping the Extras drawer, then tapping the Pager icon.

2) Tap Find to display the Find slip.

3) Tap Look for, then tap either "dates before" or "dates after". Since each page is time and date stamped, this will display a list of pages that were received either before or after the date you entered in the Find slip.

4) Tap the overview dot between the arrows at the bottom of the screen to display the selected list of pages.

5) Tap the Envelope icon at the bottom of the list, then tap Delete. All of the pages in the list will be deleted.

Newton Connection Kit for Windows: -10066 Error (1/94)

==========

Article Created: 11 January 1994

TOPIC -----

After starting a synchronization, both the Newton MessagePad and the Newton Connection Kit for Windows display error -10066.

How do I recover from this?

DISCUSSION -----

If this occurs during a synchronization with the Connection Kit for Windows, install either the 1.04 update (if you have 1.0 ROMs) or the 1.11 update (if you have 1.1 ROMs). These updates can be found on the Windows Connection Kit Disk. Their filenames are SYSUPD104.PKG (for 1.0 ROMs) and SYSUPD111.PKG (for 1.1 ROMS).

MODE32: System Software Compatibility (8/95)

Revised: 8/15/95
Security: Everyone

MODE32: System Software Compatibility (8/95)

==========

Article Created: 14 February 1994
Article Reviewed/Updated: 15 August 1995

TOPIC ----------

With which versions of Macintosh System Software is MODE32 compatible?

DISCUSSION ----------

MODE32 is a system extension produced by Connectix that provides 32-bit addressing for System 7 through System 7.5 on the Macintosh SE/30, II (requires PMMU), IIx, and IIcx. This feature is otherwise unavailable on these Macintosh models, yet is needed to run System 7.5. MODE32 is only designed for use on these four Macintosh computers.

MODE32 may operate with System 7 Pro, but has not been tested and is not supported.

Either MODE32 or Apple's 32-bit Enabler can be used with System 7.1, but do NOT use both at the same time.

MODE32 only works with System 7.0 and later. If you want to use 32-bit addressing mode with System 6.0 you need to use the Connectix product, OPTIMA.

For more information on MODE32, see "MODE32 Version 7.5: Release Notes and Instructions" and "System 7.5: MODE32 Now Compatible."

Article Change History:
15 Aug 1995 - Add information on System 6.0 and 32-bit addressing.
15 Feb 1995 - Revised keyword for System 7.5.

Macintosh AV Systems: Video Capture Rate (1/94)

Revised: 1/20/94
Security: Everyone

Macintosh AV Systems: Video Capture Rate (1/94)

==========

Article Created: 19 January 1994

TOPIC ----------

What is the video capture rate, in frames per second, when copying from a VCR to a Macintosh Quadra 660AV or 840AV?

DISCUSSION ----------

The video-in capabilities of the Quadra 660AV and 840AV support full-motion, full-screen viewing of any video material in the NTSC, PAL, or SECAM format.

The video subsystem is completely independent of the CPU or DSP. One of the features provided by this subsystem is the ability to record a quarter screen image at 10 to 20 frames per second directly to a hard disk in real-time without data compression.

Video-in provides for on-screen viewing of video materials, 24-bit frame capture, and QuickTime movie recording without additional hardware.

AV Series, AudioVision: Level Sensitivity Settings (1/94)

==========

Article Created: 19 January 1994

TOPIC ----------

What are the line level sensitivity settings found in Sound Options dialog box in the AV Series Sound control panel. I'm using the AudioVision 14 Display with my AV Series Macintosh. The AV Series manual does not explain these settings and I'd like to know more.

DISCUSSION ----------

The following information was extracted from the Apple AudioVision 14 Display Developer Notes; Pages 32-34.

AudioVision Sound Options Dialog Box

- The controls in this dialog box are intended for power users.

- When you select an option in this dialog box, it is effective immediately.

AudioVision Sound Options functions. The remainder of this article explains the Sound Options dialog box controls.

External Sound Input buttons

These controls allows you to set the levels of the external sound input, specifically line level and microphone level.

The AudioVision 14 Display accepts 2.0 V and 4.0 V peak-to-peak sound input signals. When you power up the display initially, the Line Level button with low sensitivity will be selected. This means that the display is set to accept the 4.0 V peak-to-peak input.

If your sound input device provides a 2.0 V peak-to-peak signal, the sound output from the display will seem relatively quiet. To compensate for

this, and boost the level of the sound output, you should select Microphone Level high sensitivity. Once you have done this, the Manager saves the setting, which becomes the default unless you change it.

You should generally select Line Level low sensitivity for audio cassettes, audio CDs, and some Apple microphones. You should select Microphone Level (high or low sensitivity) for most other microphones.

External sound input plays through speakers and headphones
(Internal microphone disables external sound input)

During normal operation, you should select "External sound input plays through speakers and headphones." When this option is selected, the "Internal microphone disables external sound input" option is also available.

You should select "Internal microphone disables external sound input" only when your sound input device is a CD player plugged into the audio input connector on the side panel of the display.

Note that Internal microphone disables external sound input may only be selected when External sound input plays through speakers and headphones is selected.

The CD player typically provides a 16-bit sound input, which is transferred through the display to the CPU, and then back from the CPU to be output from the display's speakers or headphone jack. Since the CPU supports only 8-bit sound I/O, the sound output provided in this way is distorted and inferior to the original input.

If you select "Internal microphone disables external sound input," the sound input will be routed directly from the input port to the display's speakers and headphone outputs, without going through the CPU. This enables the display to function as a powered speaker system, and ensures that there is no loss in sound output quality.

If you are recording from the CD (or other sound device) input, the sound input must be routed through the CPU, and you should select "External sound input plays through speakers and headphones."

Cent,Quad 610,660AV: Powering down AudioVision Dsply (1/94)

Revised: 1/20/94
Security: Everyone

Cent,Quad 610,660AV: Powering down AudioVision Dsply (1/94)

==========

Article Created: 19 January 1994

TOPIC -----

On page 5 of the AudioVision 14 Display User Guide, it states that "by powering down the computer, the monitor will also power down."

Is this incorrect?

DISCUSSION -----

Yes. This is a mistake in the AudioVision 14 Display manual. Both the Centris 610 & Centris/Quadra 660AV have a pass through power supply. This means that as long as the Centris is plugged in and the monitor is plugged into the Centris, there will be power to the monitor. The only way to power the monitor down would be to manually power down the monitor with the on/off button on the back of the monitor.

AV Series: RS383 Video Support? (1/94)

Revised: 1/20/94
Security: Everyone

AV Series: RS383 Video Support? (1/94)

==========

Article Created: 19 January 1994

TOPIC -----

I want to set up a Quadra 660AV running VideoMonitor to use in place of regular aircraft monitors, which are very expensive.

I know the AV Series Macintoshes support NTSC, PAL, SECAM. Can they run RS383 video instead? RS383 is a composite video, 640x480. They want to use C++ to create buttons that simulate those buttons around the aircraft monitor. Can DSP (Digital Signal Processor) handle it?

DISCUSSION -----

We are not familiar with the RS-383 video format. However, there is an chance the format will work if its horizontal and vertical frequencies correspond to those employed by one of our Macintosh computers. If this is the case, a cable must be made with the appropriate sense line configuration.

GeoPort, Express Modem: The : and W Commands (1/94)

Revised: 1/20/94
Security: Everyone

GeoPort, Express Modem: The ":" and "W" Commands (1/94)

==========

Article Created: 20 January 1994

TOPIC ----------

I am trying to send a FAX using my telephone credit card according to page 32 of the Express Fax/Modem User's Guide (GeoPort Telecom Adapter version), and I'm having trouble getting the modem to recognize the ":" modem command using a GeoPort Telecom Adapter on my Macintosh AV computer.

DISCUSSION ----------

According the Express Fax/Modem User's Guide the ":" command is the same as the "W" modifier, except that the ":" can detect most calling card tones. The "W" modifier is used to make the modem detect a dial tone before sending the next digit, for example, calling card number. In some instances, the modem will not be able to recognize the ":" command using the Express Modem software version 1.1.2 that comes with the GeoPort Telecom Adapter. The solution is to use commas to delay the modem to wait until the long distance carrier dial tone is sent. The comma will delay the modem 2 seconds for each comma.

ARA 2.0 Client: Network Installer Instructions (1/94)

Revised: 1/20/94
Security: Everyone

ARA 2.0 Client: Network Installer Instructions (1/94)

==========

Article Created: 20 January 1994

TOPIC --------------------

These are instructions for creating a net install version of Apple Remote Access, using the Apple Remote Access Client set of three floppy disks. This net install version can be stored on an AppleShare File Server or File Sharing volume, and then installed over an AppleTalk network onto a AppleShare Workstation Client Macintosh.

DISCUSSION --------------------

The AppleShare System Administrator should choose the volume where this net install version will be located. Create a folder called (for example) ARA 2.0 Client Net Install, and drag copy each of the three disks into it. This is done by inserting a disk, selecting the icon on the desktop that represents that disk, and dragging it to the ARA 2.0 Client Net Install folder. Continue until all three disks have been copied.

Double click on the folder called ARA PS Install 1, to open it. Select and drag the file named Installer (the actual Installer application) from the ARA PS Install 1 folder, to the ARA 2.0 Client Net Install folder. Repeat this process for the file named Remote Access PS Install (the Installer script). You are now done.

Now, any AppleShare Workstation Client who has access privileges to the ARA 2.0 Client Net Install folder, can navigate to there, double-click the Installer application or the Installer script, and install Apple Remote Access onto their system, across the AppleTalk network.

AV Series: Using Macintosh Easy Open Software (1/94)

==========

Article Created: 20 January 1994

TOPIC ----------

I'm having trouble with my Centris or Quadra AV and Easy Open that came with my Apple Media Tool and MacLink?

DISCUSSION ----------

You need the following items installed on your AV Series Macintosh:

- Macintosh Easy Open Reference version 1.0.3
- Document Converter version 1.0.3
- Macintosh Easy Open Setup version 1.0.3
- Macintosh Easy Open version 1.0.3
- System Enabler 088 version 1.1

Multimedia Kit: Last Dinosaur Egg CD Bug (1/94)

==========

Article Created: 24 January 1994

TOPIC -----

When using the CD, "Victor, Vector, and Yondo: The Last Dinosaur Egg," the game tells me (via a message on the screen) there is a virus. I ran Norton Utilities and Disinfectant and found problems. Can you explain what is going on?

DISCUSSION -----

Apple contacted Sanctuary Woods Multimedia, the makers of the CD, and spoke with their technical support group. That virus message is actually part of the game and it's unlikely that the game caused the problems.

Sanctuary Woods Multimedia is aware of problems with that particular CD. The QuickTime version on the CD is corrupt and users will have problems if they install it. Also, the CD will crash with Type 1 and Type 28 errors if AppleTalk is active. There is a fix in a newer version which customers can order by calling: 1-800-665-2544.

Macintosh: Can It Be Used as a USENET News Server? (3/95)

Revised: 3/31/95
Security: Everyone

Macintosh: Can It Be Used as a USENET News Server? (3/95)

==========

Article Created: 26 January 1994
Article Reviewed/Updated: 31 March 1995

TOPIC ----------

Can I setup a Macintosh, using either the Macintosh Operating System (Mac OS) or A/UX, as a USENET news server?

If not, where can I get USENET news server software for other computers?

DISCUSSION ----------

You can setup a Macintosh as a USENET news server under A/UX, since it can use UNIX-based USENET new server software. We aren't aware of any Mac OS-based USENET news server software.

There is a large amount of news software available on the anonymous-ftp Internet hosts. Some of the USENET news software had been developed by the USENET community, such as B news, C news, NN, INN, nntp, rn, trn, ... etc. C News, NN, and INN are the programs most people are running for news servers.

INN (InterNetNews) seems to be the most current news server software being developed. Here is the description from INN's README file:

InterNetNews is a complete Usenet system. The cornerstone of the package is innd, an NNTP server that multiplexes all I/O. Think of it as an nntpd merged with the B News news, or as a C News relay news that reads multiple NNTP streams. Newsreading is handled by a separate server, nnrpd, that is spawned for each client. Both innd and nnrpd have some slight variances from the NNTP protocol.

Two news readers for UNIX systems are rn (read news), trn (threaded version of rn). Some Macintosh OS news reader packages (to access the news on the UNIX side of the news server) are Netnews, NewsWatcher, and Nuntius.

I believe the above mentioned software is available through some of anonymous-ftp hosts in the Internet. One source is the host sunic.sunet.se (192.36.125.2).

LW Pro 810: EPS File and Faxing in High Resolution (1/94)

Revised: 1/26/94
Security: Everyone

LW Pro 810: EPS File and Faxing in High Resolution (1/94)

==========

Article Created: 26 January 1994

TOPIC ----------

Problem

Graphics are created in Adobe Illustrator. They are imported into PowerPoint as an EPS file. The file is successfully printed on a PostScript printer. The same file cannot be faxed with acceptable quality. The text and graphics from PowerPoint are faxed at maximum resolution, but it appears the EPS imported file is printed in low resolution "preview mode.”

Questions
----
1. Will the LW Pro 810 with fax capability completely rasterize the file at maximum resolution, including the EPS import, and fax it to a standard fax machine?

2. Is there a fax phone book file capability?

3. Can Windows users get access to all the printers features and its fax capabilities? Also, can they use some type of Ethernet to talk to the printer?

DISCUSSION ----------

1. Although you do not state what type of fax you're using I'm assuming that it is something like the Express Modem Fax software. This software uses QuickDraw for imaging the fax, therefore it is only using the preview of the EPS file. If you save the EPS file without a preview then the fax would have no graphic at all.

   The LW Pro 810 fax option will use the EPS data and send the fax in high resolution.

2. Yes, there is a phone book utility that comes with the LaserWriter 8.1.1f driver.

3. Windows users can use the all of the printer's features that make sense, for example it's unlikely that a Windows user would use LAT. Ethernet can be used but the Windows machine would have to have either TCP/IP or AppleTalk drivers installed.

System 7.1: Clean Installation from 1.44MB Disks (5/96)

Revised: 10/14/96
Security: Everyone

System 7.1: Clean Installation from 1.44MB Disks (5/96)

==========

Article Created: 25 January 1994
Article Reviewed/Updated: 27 May 1996

TOPIC ----------

This article presents the steps necessary to perform a clean installation of system software version 7.1. Follow these instructions in the order presented.

DISCUSSION ----------

Purpose of a Clean Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in troubleshooting.

Follow these instructions in the order presented.

Restart with Disk Tools

Shut down your Macintosh computer, insert the Disk Tools diskette in the floppy drive, and turn on the computer. At the desktop, the Disk Tools floppy disk's icon should be in the upper-right corner of your screen with your hard disk's icon below it.

If the computer ejects the Disk Tools disk, make sure you have an Apple SuperDrive (formerly FDHD) that will read high-density disks. If your computer does not have a SuperDrive, you need system software version 7.1 on 800K disks. To get them, call the Apple Order Center.

The Tech Info Library article titled "Locating Vendor Information" can help you

search for the Apple Order Center's phone number.

Run Disk First Aid

Disk First Aid can detect and repair problems with a hard disk.

Step 1
Open the Disk Tools disk, and double-click on the Disk First Aid icon. In the window that appears, be sure the main hard drive is selected. If it is not, click the Drive button to select the main hard drive.

Step 2
Click once on Open and then once on Start. Disk First Aid will check your hard disk for any potential problems. If it finds problems, you should let the software repair them.

Step 3
Repeat this procedure for each hard disk attached to the system.

Step 4
When you are finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid cannot repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup.

Update Hard Disk Drivers

If you do not have an Apple hard drive, or you use third-party software to format your hard disk, do not use the Apple HD SC Setup utility. However, you should contact your hard drive vendor to verify that your formatting software is compatible with system software version 7.1.

If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that is on the Disk Tools disk, following these steps:

Step 1
Double-click the HD SC Setup icon on the Disk Tools disk to open it.

Step 2
Click on the Update button.

Step 3
When you are finished, click Quit to return to the desktop.

Sometimes HD SC Setup cannot update the hard disk driver (indicated by a "dimmed" Update button). Here are some possible causes and solutions:

• If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard drive.

• If a version of Apple HD SC Setup more recent than the version on the Disk

Tools disk formatted your hard drive, do not update the hard disk drivers.

• If an earlier System 6 version of Apple HD SC Setup formatted the drive, it may not have left enough room for the updated driver. You do not have to update the hard disk drivers. However, if you intend to use file sharing or have a Macintosh that can use virtual memory, then you need to back up the disk and reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

• If the driver is corrupt, the Macintosh does not recognize the drive (that is, the drive does not show on the desktop when you start from a floppy disk). You may wish to reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

• If the driver has been modified with compression or security software you will not be able to update the driver. Contact the vendor for additional help.

Check Available Hard Disk Space

Be sure you have at least 5 MB available on the hard disk where you plan to install the system software. Open the hard disk's window. Open the Views control panel and select "Show disk info in header." The amount of available disk space appears in the upper-right corner of any open window.

If there is less than 5 MB available, you will need to delete some unnecessary files by moving them to the Trash. Choose Empty Trash from the Special menu, and you will have more disk space available. Or you can copy files onto floppy disks or other media before moving them to the Trash.

Disable the System Folder

You disable the System Folder by moving the System and renaming the System Folder.

Step 1
Open your hard disk's icon and locate the System Folder.

Step 2
Open the System Folder and locate the System file.

Step 3
Move the System file into the Preferences folder.

Step 4
Close the System Folder's window and rename the System Folder
"Storage."

Step 5
Close all windows that are open on your desktop.

Restart Your Computer

Choose Restart from the Special menu. The system automatically ejects the Disk

Tools disk, and after a few seconds you should see a picture of a disk with a flashing question mark.

If your Macintosh starts up from the hard drive, you have an extra System Folder on the hard disk. You need to delete it or disable it as described in the previous section, then restart.

When you get the disk with the flashing question mark on your screen, you can continue. If you still do not see this on your screen, and you are installing the system software on the internal hard disk, turn off your Macintosh and all attached peripherals. Then disconnect the SCSI cable from the back of the Macintosh. Start your Macintosh again.

Install System 7.1

Install system software version 7.1 following these steps:

Step 1

When you see the disk with a flashing question mark, insert the Install 1 or Install Me First disk into the Macintosh. The computer will start up with the system files on the Install disk.

If you have a Macintosh computer that requires a System Enabler, you should use the Install Me First disk that came with your computer. The standard 7.1 Install disk does not contain the Enabler, and will not start up a Macintosh that requires one.

Step 2

Once the "Welcome to the Apple Installer" message appears, click on OK.

Step 3

Click on Install.

Step 4

Insert the other disks when the Installer asks you to.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks are not available, you may move the non-standard items from the Storage folder to the new System Folder. Be careful not to replace anything that is already in the new System Folder. Only move items that are not already in the new System Folder.

Step 1
Open each corresponding folder within the System Folder and the Storage folder and then compare the contents.

Step 2
Move anything that is not already in the new System Folder and its subfolders from the Storage folder and its subfolders.

Step 3
Restart your Macintosh.

Troubleshooting Extension Conflicts

If you have installed any system extensions or control panels, you will probably see their icons line up across the bottom of the screen when you restart. They load into memory at startup time and modify the standard behavior of the operating system.

Verify INIT Conflict

If the Macintosh fails to restart or behaves erratically, you probably have an incompatible or conflicting INIT (also known as a system extension or control panel). To verify this problem, follow these steps:

Step 1
Be sure the Caps Lock key is off.

Step 2
Restart, and after you see the picture of a computer with a smile, hold down the Shift key.

Step 3
Release the Shift key when the "Welcome to Macintosh, Extensions Off" message appears.

Step 4
When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting extension or control panel. Continue with the steps in the next section.

Remove and Replace INITs in System Folder

Step 1
Create a new folder on the desktop.

Step 2
Open the System Folder, Extensions folder, and Control Panels folder, and choose by Kind from the View menu. Move all items of Kind "system extension" or "control panel" to this new folder.

Step 3
Close the System Folder, and restart the Macintosh.

Step 4
Attempt to recreate the problem.

Step 5
Move one item from the new folder on the desktop to the closed System Folder and restart the Macintosh.

Step 6
Attempt to recreate the original problem.

Repeat steps 5 and 6 for each item in the new folder on the desktop until the problem recurs. The last item returned to the System Folder is probably the cause of the problem.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

When the Macintosh behaves as expected, move the Storage folder to the Trash, and choose Empty Trash from the Special menu.

System Update

After performing a clean installation of System 7.1, you may want to consider installing System Update 3.0 to ensure that you have the most current version of the system software.

System Update 3.0 is available from the Apple Software Updates area of many online services. More specific information about how to find the updates on these services is available in Fax document #20729. If you do not have access to any online services, please call 1-800-SOS-APPL for more information.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
27 May 1996 - Updated for technical accuracy.
19 May 1995 - Corrected step numbering format.
17 May 1995 - Added information about installing System Update 3.0.

Chinese Language Kit: Third Party Product Solution (1/94)

Revised: 1/26/94
Security: Everyone

Chinese Language Kit: Third Party Product Solution (1/94)

==========

Article Created: 25 January 1994

TOPIC --------------------

For customers using the Chinese Language Kit, the product described below may be of assistance.

Note: this product does not compete with the Chinese Language Kit.

DISCUSSION --------------------

I recently demonstrated a product that meets the following needs for people using the Chinese Language Kit:

• Conversion of simplified characters to traditional, and vice versa, "on the fly." In other words, users can create text on the screen using simplified characters, then convert it to traditional and back again.

• Complete phrase input, as opposed to character by character.

The product is called Sindex, and it is available as a bundle with a word processor called Wintext. Wintext is one of the applications that is listed as being "Worldscript 2-byte savvy." It can be purchased from Pacific Rim Connections (415/697-0911) and is fully supported by the Chinese Language Kit.

For detailed information on Pacific Rim Connections, type their name as the search string.

Power Macintosh 7100/66: Specifications (Discontinued)

Revised: 8/30/95
Security: Everyone

Power Macintosh 7100/66: Specifications (Discontinued)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 29 August 1995

TOPIC ----------

This article gives the technical specifications for the Power Macintosh 7100/66 computer.

DISCUSSION ----------

Microprocessor

- 66-MHz PowerPC 601 RISC Processor

Memory

- 4 MB ROM
- 256 bytes of non-volatile parameter memory
- 8 MB of RAM standard, expandable to 136 MB
- 4 SIMM slots (2 pairs)
- SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs of the same size. For example, you should install two 8 MB SIMMs in first two adjoining slots, and can install two 4 MB SIMMs in the remaining two for a total of 32 MB.
- Possible RAM configurations numerous: 8 MB, 16 MB, 24 MB, 32 MB, 40 MB, 48 MB, 72 MB, 80 MB, and 136 MB.
- 80 ns SIMMs or faster
- L2 Cache Slot for Optional Macintosh Cache Card

RAM note: All 8MB RAM configurations come with 8MB of RAM soldered onto the logic board

Form Factor

- Modular desktop enclosure (similiar to Quadra 650 enclosure)

Disk Drives

- One Built-in Apple SuperDrive 1.4 MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, and OS/2 disks.
- Support for two internal SCSI devices, one of which may be used for a one-half height, 5.25-inch removable media drive, such as an internal CD-ROM drive.
- One internal hard disk
- Optional internal Apple CD-ROM drive (see above)
- Optional external SCSI hard disk drive (many capacities available)

Video Display

- DRAM based video: 16 bit on 14-inch monitors, 8 bit on 16-inch monitors 640k of non-expandable DRAM-based video
- VRAM based video: 1MB: 16 bit on 16-inch monitors, 8 bit on 21-inch monitors. 2MB: 24 bit on 16-inch monitors, 16 bit on 21-inch monitors (The table below details support for colors or grays for specific monitors.)

Begin_Table

Monitor:	Resolution:	1 MB VRAM:	2 MB VRAM:
12-inch Color	512 by 384	millions	millions
12-inch Monochrome	640 by 480	256	256
13-inch or 14-inch Color or VGA	640 by 480	thousands	millions
15-inch Portrait Monochrome	640 by 870	256	256
16-inch Color	832 by 624	thousands	millions
19-inch Color	1024 by 768	256	thousands
21-inch Color	1152 by 870	256	thousands
SuperVGA	800 by 600	thousands	millions
NTSC	640 by 480	thousands	millions
NTSC flicker-free	640 by 480	256	256
NTSC	512 by 384	thousands	millions
NTSC flicker-free	512 by 384	256	256
PAL	768 by 576	thousands	millions
PAL flicker-free	768 by 576	256	256
PAL	640 by 480	thousands	millions
PAL flicker-free	640 by 480	256	256

*NOTE - NTSC and PAL display modes supported only on AV configurations.

End_Table

Interfaces

- Three internal Nubus 90 slots, support block transfers to and from main memory, 2x block transfers card to card.
- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices.
- One AAUI-15 Ethernet connector.

- Two serial (RS-232/RS-422) ports. (Printer & Modem/GeoPort)
- SCSI interface for connecting up to a total of seven SCSI devices.
- Sound output port for stereo compact disc audio and stereo computer-generated sound.
- Sound input port for stereo sound input (supports 16-bit stereo audio)
- One AV Display Connector supports the Apple AudioVision 14 Display.
- The available Video Adapter Cable (Part #M2681LL/A) allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video.
- One internal 601 PDS (processor direct slot)
- One internal L2 (Level 2) cache slot

Audio System

- 16-bit stereo in and out
- Sample rates of 48, 44.1, 24, 22.05 kilohertz (kHz)
- Input line level: 1 volt peak-to-peak
- Output line level: 1 volt peak-to-peak
- Input SNR (signal-to-noise ratio): 82 decibels (dB) with no audible discrete tones
- Output SNR: 85 dB with no audible discrete tones
- Bandwidth: 20 Hz-20 kHz (+/- 2 dB) at 44.100 kHz sample rate
- THD+N (Total harmonic distortion plus noise): Less than 0.05 percent; measured 20 Hz-20kHz with a 1-Vrms sine wave input.

Networking

- Built-in Ethernet
- Serial port for AppleTalk
- Integrated GeoPort telecommunications architecture for data, fax, and voice connectivity.

Keyboard

- Several Apple Desktop Bus keyboards with numeric keypads available.

Mouse

- Apple Desktop Bus Mouse II; mechanical tracking, optical shaft, or contact encoding.

Clock/Calendar

- CMOS custom chip with long-life lithium battery.

Apple PlainTalk Microphone (optional)

- The microphone is unidirectional and optimized for use with speech recognition.

Disability Access

- Easy Access, and visible beep included with system software. These built-in

features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 100 to 240 VAC, RMS single phase, automatically configured
- Frequency: 50 to 60 hertz, single phase
- Power Supply Output Rating (Power available for internal devices)
  - Continuous output 112W

- A/C Line Input (Power drawn by the Power Macintosh 7100/66)
  - Maximum continuous 167W
  - Peak input 230W

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three Apple Desktop Bus devices is recommended)
- Mouse draws 10 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Size and Weight

Main unit:

Height: 6 inches (15.3 cm)
Width: 13 inches (32.8 cm)
Depth: 16.5 inches (42 cm)
Weight: 25 lb. (11.32 kg)

*Weight varies based on internal devices installed

Mouse:

- Height 1.3 inches (33 mm)
- Width 2.4 inches (61.7 mm)
- Depth 4.2 inches (107.3 mm)
- Weight 4 ounces (0.10 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F (-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048m)

System Software Requirements

Requires System 7.1.2 for Power Macintosh or later and System Enabler.

..TIL14493-Power_Macintosh_7100-66-Specifications_Discontinued.pdf

Article Change History:
29 Aug 1995 - Added more information about DRAM.
21 Oct 1994 - Corrected dimensions and weight.
23 Aug 1994 - Additional power supply ratings documented.

Power Macintosh: Do Any Models Have a DSP chip? (1/94)

Revised: 5/24/95
Security: Everyone

Power Macintosh: Do Any Models Have a DSP chip? (1/94)

==========

Article Created: 26 January 1994

TOPIC -----

I'm considering a Power Macintosh model, but I need to know if any model includes a DSP (Digital Signal Processor) chip?

DISCUSSION -----

None of the models introduced in March, 1994 include a DSP chip. However, some third party vendors might offer a DSP chip on a NuBus or PDS (Processor Direct Slot) card.

Please note however, that all Power Macintosh models can use the Apple Real Time Architecture (ARTA) introduced with the Centris/Quadra 660AV and Quadra 840AV. Thus, image processing, telephony and other applications which use ARTA to improve performance will continue to have that advantage.

HyperCard: Phone Dialing with Abaton Interfax Modem (7/92)

==========

Article Created: 12 July 1991
Article Reviewed/Updated: 25 Mar 1994

TOPIC --------------------

The Phone stack in HyperCard 1.2.5 (and presumably in 2.0 and 2.1 as well) does not automatically dial numbers if you have an Abaton Interfax modem.

DISCUSSION --------------------

To get HyperCard to automatically dial, turn the Interfax control off in the Abaton Interfax control panel.

HyperCard: Working with Alias Manager (3/94)

Revised: 3/25/94
Security: Everyone

HyperCard: Working with Alias Manager (3/94)

==========

Article Created: 30 March 1992
Article Reviewed/Updated: 25 March 1994

TOPIC -----

I want to read from a file in a folder using an alias folder located on the startup volume. The folder pointed to by the alias is located on another mounted volume in the same AppleTalk zone (volume is visible on the Desktop).

Here is the script segment:

```
put "myMachine:aliasFolder:theFileName" into thePath
open file thePath
read from file thePath until end
close file thePath
```

This returns the error that there is no open file by that name. If I substitute the other volumes name instead of "myMachine" it works just fine.

Why can't HyperCard resolve this alias?

DISCUSSION -----

Unfortunately, the Alias Manager doesn't resolve this alias. You've created this pathname by concatenating the path of an alias file and the leaf name of the target:

```
myMachine:aliasFolder:theFileName
|<--- alias file --->|
```

The pathname you want to resolve must refer to a real file on your desktop -- either an alias file or the real thing, like so:

```
myMachine:myAliases:aliasToFile
```

```
   |<------- alias file -------->|
```

In other words, you need to use an alias for the file you want, not for the folder that it lives in.

HyperCard: Ask Command Documentation Correction (8/92)

Revised: 5/9/94
Security: Everyone

HyperCard: Ask Command Documentation Correction (8/92)

==========

Article Created: 29 May 1992
Article Reviewed/Updated: 26 August 1992

TOPIC --------------------

On page 164 of the HyperCard Script Language Guide there is an error in describing the "ask" command.

DISCUSSION --------------------

The syntax given for the "ask file" variation includes the optional word "default" for indicating a default file name. The command is as follows:

ask file [promptText] [with [default] fileName]

* Note - promptText and FileName are italicized

The word default is in plain text, indicating that it can be used as an element in the expression, and is in brackets [], indicating that it is optional.

Given this information, you should be able to type the following handler and get a file name of "Copy":

ask file "Save this file as...." with default "Copy"

Instead the file name comes up as "default Copy". This is an error in the documentation, not with HyperCard. The word "default" describes fileName. A corrected version of the expression would read:

ask field [promptText] [with defaultFileName]

* Again - promptText and defaultFileName are italicized.

HyperCard: Card Size Constraints (7/92)

Revised: 3/25/94
Security: Everyone

HyperCard: Card Size Constraints (7/92)

==========

Article Created: 4 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --

This article describes HyperCard's card size constraints, and tells how to change a stack's card size.

DISCUSSION --

- All the cards in a given stack must be the same size, even if there are several different backgrounds in the stack.
- Smallest card size: 64 x 64 pixels
- Largest card size: 1280 x 1280 pixels.

To change the card size:
1) Choose Stack Info from the Object menu. In the Stack Info dialog box, click Resize.

2) You have two objects for changing the card size:
   - Choose a size from the pop-up menu that appears to the right of Card size.
   - Drag the little black square in the lower-right corner of the card graphic in the dialog box until you see the card measurements you want.

Note: The card size is restricted by memory. If you are unable to reach the largest size of 1280 x 1280, it is probably due to a lack of memory. That is, you might not have enough memory allocated to HyperCard, or you might not have enough RAM installed in the computer.

HyperCard: Problem with CD-Audio XCMDs from Voyager (12/95)

Revised: 12/22/95
Security: Everyone

HyperCard: Problem with CD-Audio XCMDs from Voyager (12/95)

==========

Article Created: 7 February 1991
Article Reviewed/Updated: 22 December 1995

TOPIC ----------

Some users, when they try to run their HyperCard 1.x stacks under HyperCard 2.0.v2, they find their previously working CD-Audio commands no longer work.

DISCUSSION ----------

Apple and Voyager both sold CD-Audio XCMDs. They were both the same product as Voyager licensed them from Apple. However, Voyager included ResCopy (the old version) to install the externals. This caused a problem when the CD-Audio externals are installed with the old version of ResCopy, the stack will not work properly under HyperCard 2.x.

To fix the problem, re-install the XCMD using either ResEdit or Resource Mover (found in the Power Tools stack).

All the development tools available from Apple are included with version 2.3 of HyperCard. CD-Audio XCMDS are not part of the HyperCard 2.3 tools and are no longer available from Apple. The Voyager company still offers the CD-Audio XCMDs.

Portions of this article were adapted from the Claris Tech Info database.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:
22 Dec 1995 - Added information on XCMD availability.

HyperCard: Changing the Cursor While in a Field or Button (8/93)

Revised: 3/25/94
Security: Everyone

HyperCard: Changing the Cursor While in a Field or Button (8/93)

==========

Article Created: 23 June 1993
Article Reviewed/Updated: 2 August 1993

TOPIC --------------------

Here is a short handler that changes the standard "Browse" cursor into another cursor while the mouse is within a button or field.

DISCUSSION --------------------

```
on mouseWithin
    set cursor to "busy" -- or other cursor
       repeat while the mouseLoc is within the rect of the target
          if the mouseClick then
               [action on mouseClick]
          exit mouseWithin
       end if
    end repeat
end mouseWithin
```

If this handler is used in a field, make sure the field is locked. If it isn't, and you click the mouse while over the field, any characters typed will be stored in a memory buffer, and the typed text will appear in the field as soon as the cursor is moved away from the field.

Putting this handler at the card level will cause it to change the cursor when it enters any button or locked field on the card. To make the handler respond specifically to buttons or fields only, insert the following line of text between ON MOUSEWITHIN and SET CURSOR TO BUSY:

```
        if "button" is not in the target then exit mouseWithin
```

Use "field" instead of button if you only want fields responded to with the different cursor.

HyperCard 2.0: Changes to the Convert Function (7/92)

Revised: 3/25/94
Security: Everyone

HyperCard 2.0: Changes to the Convert Function (7/92)

==========

Article Created: 10 April 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

HyperCard 2.0v2 handles the Convert function differently than HyperCard 1.2.x.

DISCUSSION --------------------

In early versions of HyperCard, the convert function would ignore parts of a date that were inconsistent. For example: April 24, 1991 is a Wednesday. Try the following line of HyperTalk code:

```
convert "Saturday, April 24, 1991" to seconds
```

The result is 2755296000, the number of seconds from January 1, 1904 to April 24, 1991. HyperCard 1.2.x ignored the (incorrect) Saturday portion.

If you try the same line of code in HyperCard 2.0, the result is "Invalid Date." HyperCard 2.0 does not allow the day name to be inconsistent with the date.

If you have a script that tries to take advantage of this feature of HyperCard 1.2.x, you will have to re-work it before it will function properly in version 2.0 or later. If you know the dayname of the long date will be incorrect, here's a suggested substitution:

instead of:

```
convert theDate to seconds
```

use:

```
put item 2 to 3 of theDate into theDate -- Drops the Day Name
convert theDate to seconds
```

If you are trying to use the Calendar stack from the old HyperCard, open

```
the background script and insert the line of code marked with "--
Inserted for HC 2.0 Compatibility."

function startOfMonth aDate     -- the seconds of Monday before the 1st
  put 60*60*24 into OneDay      --seconds in a day
  put aDate into it
  convert it to long date
  put 1 into word 2 of item 2 of it     --first of month
  put item 2 to 3 of it into it -- Inserted for HC 2.0 Compatibility
  convert it to seconds
  convert it to long date
  repeat while item 1 of it <> "Sunday"
    convert it to seconds
    subtract OneDay from it    --look for previous Sunday
    convert it to long date
  end repeat
  convert it to seconds
  return it
end startOfMonth
```

HyperCard: Disabling Arrow Keys while Keeping Text Arrows (8/93)

==========

Article Created: 17 May 1993
Article Reviewed/Updated: 2 August 1993

TOPIC --------------------

To disable navigation through a stack with arrow keys, while still allowing arrow keys to be used in a field, put the following handler in the stack or background script.

DISCUSSION --------------------

```
on arrowKey
    if the selectedField is not empty then pass arrowkey
end arrowkey
```

This will make sure that the cursor is within a field before passing the arrowKey.

HyperTalk: Drawing Multiple Horizontal or Vertical Lines (7/92)

==========

Article Created: 19 November 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

The first handler below is a quick way to get multiple horizontal lines drawn on your cards. The second handler does the same thing with vertical lines.

DISCUSSION --------------------

```
on mouseup
  put 0 into vert
  choose line tool
  repeat with n=1 to 68
    drag from 0,vert to 512,vert
    put vert+5 into vert
  end repeat
  choose browse tool
end mouseup
```

```
on mouseup
  put 0 into horiz
  choose line tool
  repeat with n=1 to 102
    drag from horiz, 5 to horiz, 160
    put horiz+5 into horiz
  end repeat
  choose browse tool
end mouseup
```

HyperCard: Script to Export Address Stack to FileMaker (6/93)

Revised: 3/25/94
Security: Everyone

HyperCard: Script to Export Address Stack to FileMaker (6/93)

==========

Article Created: 5 February 1991
Article Reviewed/Updated: 1 June 1993

TOPIC ----------

The following handler creates a tab-delimited text file from the HyperCard 1.x Address stack, with the elements of data parsed reasonably thoroughly. This enables you to bring your data into FileMaker.

DISCUSSION ----------

The created text file has to come into a database with the following fields, and in the following order:

- Name
- Company
- Street Address
- City, State
- Zip Code
- Phone 1
- Phone 2
- Phone 3
- Phone 4
- Check field

Tabs will separate the records, so it will be a standard merge file. More fields than these can exist, and if you want to separate Last and First Names, and State, that can be done in FileMaker later, or the script could possibly be modified.

The check field will mirror the original HyperCard form of the database, and so will contain much redundant information. However, since there will always be data that we can't parse (titles, divisions, odd or foreign addresses, etc.), we need this field so you can double-check your data, and perform additional manipulations.

```
on mouseUp
```

```
  ask "Please name the new text file." with "HC.txt"
  if it is empty or the result is "Cancel" then exit mouseUp
  put it into fileName
  set cursor to watch
  set lockMessages to true
  set lockRecent to true
  if number of bg fields = 0 then
    answer "There are no background fields from which to export data!"
    exit to HyperCard
  end if
  set lockRecent to true
  open file fileName

  lock screen
  repeat the number of cards
    set cursor to busy
    --
    -- Now figure the how many lines we have, and where the lines go.
    -- Our rules:
    --  If there are 3 lines, then they are Name, street address, citystatezip.
    --  If there are more than 3 lines, then
    --    the last line is citystatezip,
    --    the next to last line is street
    --    the third to last line is company
    --    and whatever else is filler.
    --  In all cases, the first line is Name.

    put number of lines in bg field 1 into numFieldLines
    repeat with i = 1 to numFieldLines
      if line i of bg field 1 is empty
      then exit repeat
      else put i into lastLine
    end repeat

-- Now we initialize our variables.
-- If we don't do this, then they may carry over their values to the next
record.

    put empty into theName
    put empty into theCompany
    put empty into theStreet
    put empty into theCityAndState
    put empty into theZip

    if lastline > 2 -- If there are 3 or more lines of data
    then
      get line lastline of bg field 1
      put last word of it into theZip
      delete last word of it
      put it into theCityAndState
    end if

    if lastline > 4 OR lastLine = 2
```

```
      then put line 1 of bg field 1 & "   *See Notes" into theName
      else put line 1 of bg field 1 into theName -- Name
      if (lastLine - 2) > 1 -- if there's a third to last line, it's company
      then put line (lastLine - 2) of bg field 1 into theCompany -- company
      if (lastLine - 1) > 1 -- if there's a second to last line, it's street
      then put line (lastLine - 1) of bg field 1 into theStreet -- street

      -- Here's our parsed information about the card.
      put theName & comma & theCompany & comma & theStreet & comma & ¬
      theCityAndState & comma & theZip & comma into theText

      put line 1 of bg field 2 & comma after theText -- phone numbers
      put line 2 of bg field 2 & comma after theText
      if line 3 of bg field 2 is not empty
      then put line 3 of bg field 2 & comma after theText
      else put comma after theText
      if line 4 of bg field 2 is not empty
      then put line 4 of bg field 2 & comma after theText
      else put comma after theText
      put bg field 3 after theText -- move the date to the notes field

      write theText & return to file fileName
      go next card
    end repeat
    close file fileName
    set lockRecent to false
    unlock screen
end mouseUp
```

HyperCard to 2.1: Extra Characters In Text Pick-up (8/93)

Revised: 3/25/94
Security: Everyone

HyperCard to 2.1: Extra Characters In "Text Pick-up" (8/93)

==========

Article Created: 12 April 1993
Article Reviewed/Updated: 2 August 1993

TOPIC ----------

In HyperCard versions 1.2.5, 2.0, 2.0v2, 2.1, and later, a feature called "Text Pick-up" allows you to copy field text into the message box by dragging across the text while holding down the Command Key.

The result of this action sometimes produces an extra random character like a, e, m, g, 1, 5, 7, etc. at the end of the string in the Message Box.

DISCUSSION ----------

Although the problem is intermittent, dragging across the text quickly seems to produce this extra character more frequently than dragging slowly.

If you are having this problem, try dragging more slowly or dragging from right to left.

HyperCard: Audio Palette vs. GateKeeper (7/92)

Revised: 3/25/94
Security: Everyone

HyperCard: Audio Palette vs. GateKeeper (7/92)

==========

Article Created: 4 January 1991
Article Reviewed/Updated: 25 March 1994

TOPIC ----------

Why does GateKeeper software sound an alert when I try to add a sound to a HyperCard stack?

DISCUSSION ----------

In HyperCard, as in other programs, sounds are saved as resources. After you record a sound the Audio Palette allows you to save the sound to a stack, but the sound gets saved as a separate resource. This causes GateKeeper to sound the "Red Alert" message because a resource is being generated.

By design, GateKeeper flags resource changes and creations. It then checks these resources against its own built-in look up table and "flags" whatever virus "match" it finds accordingly.

Note: There is apparently a conflict between GateKeeper Aid version 1.0.1 and the Audio Palette in 2.1. If the INIT is installed and you try to save a sound through the audio palette, the system will crash. Removal of GateKeeper Aid or upgrading it to version 1.1 solves the problem.

HyperCard: Converting SuperCard Projects to HyperCard (3/93)

Revised: 3/25/94
Security: Everyone

HyperCard: Converting SuperCard Projects to HyperCard (3/93)

==========

Article Created: 27 January 1993
Article Reviewed/Updated: 29 March 1993

TOPIC ----------

Heizer Software has a utility program, called Homeward, for converting SuperCard projects to HyperCard stacks.

DISCUSSION ----------

Homeward performs about 70% of the conversion work. Projects with multiple windows are no problem. Each window is translated into a new stack, including the scripts and objects associated with each window. Graphics, including color, are converted, as well as first-pass translation of SuperTalk scripts. Color and irregular-shaped objects are handled with XCMDs.

Some work will be required to refine the newly created HyperCard stacks. To aid in this process, Homeward generates a detailed "Exception List," pin-pointing items that may require further attention. Many vendors offer solutions for recreating SuperCard feature which are not directly supported by Homeward, such as list objects and animations.

Contact Heizer Software for more information. To locate a vendor's address and phone numbers, use the vendor's name as a search string.

HyperCard: How It Loads and Calls Externals (8/93)

Revised: 3/25/94
Security: Everyone

HyperCard: How It Loads and Calls Externals (8/93)

==========

Article Created: 10 August 1993

TOPIC ----------

This article is about how HyperCard loads and calls externals.

DISCUSSION ----------

HyperCard 1.x

HyperCard 1.x loaded externals with a GetNamedResource call, then tried to make a copy of the external using NewHandle/BlockMove. If that failed, it used DetachResource to get the external away from the Resource Manager. It then moved the external high (MoveHHi), locked it on the heap (HLock), and jumped to it. The reason for making a copy or using DetachResource was to make sure the external stayed around even if the resource file it came from got closed.

HyperCard 2.x

HyperCard 2.x uses Get1Resource to read the external from a resource file, but it doesn't make a copy or detach the external -- it just moves it high, locks it, and jumps into it.

This method has a potential side-effect. With HyperCard 2.x, if an external somehow closes the resource file it came from while it is running, the block the resource is in will be marked purgeable (by the Resource Manager), and may be purged. Externals are usually pasted into a stack, so if an external does something to close the stack it came from, it could end up purging itself. An external could get purged simply by executing a callback that caused HyperCard to go to another stack.

HyperCard, Apple Events, and Frontier (8/92)

Revised: 3/25/94
Security: Everyone

HyperCard, Apple Events, and Frontier (8/92)

==========

Article Created: 4 June 1992
Article Reviewed/Updated: 25 March 1994

TOPIC --------------------

When using the "send" command to execute Frontier scripts while the scripts are running, status messages are sent to the Frontier status bar using the msg command in Frontier. Is it possible to have the messages sent to the Frontier status bar sent to a HyperCard field (or "status window") instead?

DISCUSSION --------------------

HyperCard is not multi-threaded. In particular, it can't automatically handle Apple Events while it's waiting for a reply to an Apple Event that it sent itself. While the "send" command awaits a reply from Frontier, all HyperCard can do is to handle update events from the Event Manager, suspend and resume events from the Process Manager, and command-periods from the user.

However, you can use an XCMD to do what you want in one of two ways:

- Send the Apple event to Frontier in queueReply mode and handle the reply that comes back from Frontier as a separate Apple event in an Apple event script (class 'aevt', id 'ansr'). This would mean that HyperCard can respond to events coming from Frontier in the meantime, including events to display the Frontier status messages in HyperCard fields. It would also mean that HyperCard will be able to respond to user events while it awaits the reply from Frontier, so you'll have to do some careful HyperTalk scripting to figure out how to reconcile what the user is doing with what you want to do when the reply from Frontier comes back. The SendAppleEvent XCMD, available online, will send an event in queueReply mode.

- Write an XCMD that sends the Apple event to Frontier and calls GetSpecificHighLevelEvent in the idle proc for AESend, in order to extract 'do script' events for HyperCard to handle while it awaits the reply from Frontier. Writing this XCMD would require pretty good

knowledge of the High Level Event Manager, the Apple event Manager, and the 2.0 XCMD callbacks, particularly RunXHandler.

HyperCard: Differences Between HyperCard and the Player (11/92)

Revised: 3/25/94
Security: Everyone

HyperCard: Differences Between HyperCard and the Player (11/92)

==========

Article Created: 17 October 1992
Article Reviewed/Updated: 25 November 1992

TOPIC ----------

What is the difference between the Standard HyperCard package, and the HyperCard Player?

DISCUSSION ----------

The HyperCard Player is designed to allow the user to view or edit the contents of the stack. Therefore, items that would allow the user to modify the HyperCard environment in any way have been removed or changed. The items removed or changed are listed below:

- The New Stack... menu item
- Many of the printing menu items
- The Icon Editor
- The Objects menu
- The Message box
- Error Strings
- The maximum user level
- The script editor
- The variable and message watchers
- Home stack

DISCUSSION ----------

New Stack Menu Item

Because of the ability to embed a stack into the HyperCard Player, the creation of a new stack (through the use of the menu item or through the command "create") behaves differently than HyperCard 2.1:

- The New Stack menu item is disabled in the HyperCard Player.
- Re-enabling this menu item will restore its HyperCard 2.1 functionality.
- All of the scriptable HyperCard 2.1 features of this menu item remain fully accessible from scripts.

Note: For additional information on this topic, please see the "Stack Embedding" note in the "Some Unique Features" section of the Player Tools stack.

Print Stack, Print Field, and Print Report

- These menu items are disabled in the HyperCard Player.
- These menu items can be re-enabled and given new menu messages (re-enabling these items WILL NOT restore the original HyperCard 2.1 functionality).
- All of the scriptable printing features of HyperCard 2.1 remain accessible from scripts.
- The Print Stack, Print Field, and Print Report dialogs and the code to support the dialogs have been removed from the Player.

Icon Editor

- The HyperCard Player does not include an Icon Editor.
- The Icon menu item is disabled.
- This menu item can be re-enabled and given a new menu message (re-enabling this item WILL NOT restore the original HyperCard 2.1 functionality).

Objects Menu

Since the HyperCard Player does not provide the user with the tools or facilities to create or modify objects, this menu has been removed.

- As in HyperCard 2.1, user level 3, there is not an Objects menu.
- All of the menu items in this menu CAN be accessed and changed from script.
- The dialogs used by the "info" menu items cannot be accessed, but the attributes contained in those dialogs can be set via script.

Message Box

The functionality of the Message box has been changed to prevent the HyperCard Player user from scripting via the Message box.

- The Message box has been simplified so that only the Find command can be executed.
- All HyperCard 2.1 forms of Find can still be used (e.g., Find whole, Find string, etc.).
- Any other evaluation or command entered and sent through the Message box will cause the HyperCard Player to beep.

Error Messages

Because the HyperCard Player is designed to allow the user to view stacks as easily as possible, the standard method of error notification has been changed. Instead of full error messages (the type that are received in HyperCard 2.1) being sent to the user, a simplified message is sent when using the Player. The error information consists of a reference to an error string list and includes the appropriate string number within that list.

For a complete discussion about this feature, please see the "Error Message Info" section of the Player Tools stack for additional information.

User Level

Since the HyperCard Player does not include facilities for authoring stacks, the functionality relating to userLevel has changed.

- From a user's standpoint, it will appear that the user level is set and restricted to user level 3 (with a few menu items disabled).
- From a functional standpoint, scripts have nearly all of the features of HyperCard user level 4 (minus a few menu items).
- The maximum user level that can now be set is user level 4 ("set userLevel to 5" will actually set the user level to 4).
- Once a script terminates, if the tool chosen in script is either the button or field tool, the Player changes the tool back to the Browse tool.

Script Editor

Because the HyperCard Player does not provide any facilities for authoring or scripting, the script editor and all of its related functionality has been removed.

- The Player does not include a script editor.
- All script editor support has been removed (including XCMD callbacks). The ability to add a script editor is not supported.
- All script editor callbacks return an error. The result field will contain an integer result code of 2, because the callback is not implemented.

Note: The "get script" and "set script" commands have all of their HyperCard 2.1 functionality. However, the script indentation code has been removed along with the "editor" code. When you "get" a script, it appears left-justified, WITHOUT indentation.

Variable Watcher and Message Watcher

Because the HyperCard Player does not provide any facilities for authoring, scripting or debugging, the variable watcher, message watcher and all of their related functionality has been removed.

- The Player does not include either watcher.
- All watcher support, including the XCMD callbacks, has been removed. The ability to add a watcher is not supported.
- All watcher callbacks return an error. The result field will contain an integer result code of 2, because the callback is not implemented.

Home Stack

The Home stack that is provided with the HyperCard Player has been simplified to reflect some of the changes made in the Player.

- The size of the Player Home stack is now 25K.
- All "Authoring" utility handlers have been removed (searchscript, c, b, s).
- This Home does not use the FontExists XCMD.

- This Home does not add or maintain any Home menus.
- This Home does not put any stacks "in use".
- The Preferences card has only three user level settings.

HyperCard 2.x: If Visual Effects Fail (11/92)

Revised: 3/25/94
Security: Everyone

HyperCard 2.x: If Visual Effects Fail (11/92)

==========

Article Created: 21 September 1992
Article Reviewed/Updated: 25 March 1994

TOPIC ----------

This article lists several conditions under which visual effects fail to work in HyperCard 2.x.

DISCUSSION ----------

- Lock screen in effect. This the most common cause. If scripts are very complicated and nested, it is not unusual to have at least one too many 'lock screen' calls. If the screen is locked, visual effect commands do nothing.

- Monitor bit depth is greater than 8 (more than 256 colors).

- Going between two stacks with different card sizes (or any two stacks with HyperCard before 2.1).

- A card window that straddles two different displays.

HyperCard: ClickText and International Systems (8/92)

Revised: 3/25/94
Security: Everyone

HyperCard: ClickText and International Systems (8/92)

==========

Article Created: 10 June 1992
Article Reviewed/Updated: 25 March 1994

TOPIC --------------------

The clickText function knows only those writing systems that are defined in the currently installed script resources. On a KanjiTalk system, for example, the clickText function knows Japanese; that is, it follows the Japanese script system's definition of a word.

DISCUSSION --------------------

Use the word "script" in this context means a collection of resources that defines a writing system. These scripts are managed by the Macintosh Script Manager, which is documented in Inside Macintosh Volume V and VI. It is possible to modify existing scripts for use with various languages.

HyperCard is actually pretty good about not making assumptions about writing systems; the handling of text was extensively revised for 2.0 to have additional compatibility with international system software.

HyperCard 2.x: International Date Formats (8/92)

Revised: 3/25/94
Security: Everyone

HyperCard 2.x: International Date Formats (8/92)

==========

Article Created: 10 June 1992
Article Reviewed/Updated: 26 August 1992

TOPIC --------------------

Does HyperCard 2.1 UK version have the same date format as the U.S. version?

DISCUSSION --------------------

HyperCard 2.x calls the Script Manager to parse and to format dates properly. Therefore, as long as you make no assumptions about date formats in your scripts, it shouldn't matter whether UK or Thai or Arabic date formats are different.

Here's an example of making bad assumptions about dates: if you want to know the number of the day of the week of a certain date, you could write a script that assumes that the date is in the form

```
Day_Of_Week, Month Day_of_Month, Year
```

This script could extract word 1 of this date and translate it into numerical form by using a large If Then Else statement in HyperTalk. If word 1 is "Sunday" then put 1 into dayOfWeek, etc. Works great under restrictive conditions, but not worldwide. Actually, it won't work if the user enters a date in any other format.

The savvy way to do this is to use the HyperTalk "convert" command to parse the date.

```
put field "date" into myLocalVar
convert myLocalVar to dateItems -- will now contain dateItems list
get item 7 of myLocalVar -- number of day of week
```

If you're concerned about displaying dates in the proper format, you can store them in a numeric form in a hidden field -- dateItems format or

seconds format will do nicely -- and put them into a visible field and convert them to human-readable form within a script, perhaps on openCard.

```
on openCard
  lock screen
  put field "Date in Seconds" into field "Display Date"
  convert field "Display Date" to long date
  unlock screen
  pass openCard
end openCard
```

If the user enters a date in a field, you can convert it to numerical form and store it in a hidden field, perhaps on closeField.

```
on closeField
  put field "User Date" into field "Date in DateItems"
  convert field "Date in DateItems" to dateItems
  if the result is not empty then -- invalid date
    answer "Invalid date." with "OK"
    select text of field "User Date" -- user should try again
  end if
end closeField
```

By translating dates back and forth between human-readable forms and numerical forms for storage, you can guarantee that dates will be displayed properly and sensibly throughout the world.

Revised: 3/25/94
Security: Everyone

HyperCard: International Sorting (8/92)

==========

Article Created: 10 June 1992
Article Reviewed/Updated: 26 August 1992

TOPIC --------------------

To specify a sort order in HyperCard, or to treat characters with diacritics differently from those without (in sorting) try:

```
sort [ascending | descending] international by <expr>
```

DISCUSSION --------------------

An example:

```
sort descending international by field "Hoopla"
```

For programmers only: The sort command follows an order established by the 'itl2" system resource. To customize the sorting order , replace the 'itl2' resource in your system. See Macintosh Technical Note #178, "Modifying the Standard String Comparison".

HyperCard: Dealing with Memory Problems (11/92)

Revised: 3/25/94
Security: Everyone

HyperCard: Dealing with Memory Problems (11/92)

==========

Article Created: 16 November 1990
Article Reviewed/Updated: 30 November 1992

TOPIC ----------

Frequently, when I attempt to paint on a card, I get the message "not enough memory to use paint tools." Other times, when I use a script that opens another application, nothing happens. What should I do?

DISCUSSION ----------

There are several things you can do to free up some memory in order to access the paint tools. Depending on your system configuration, any or all of these tips might help:

1) Turn off memory-hungry INITs and CDEVs. SoundMaster can take up a huge amount of memory if you are using large sound files. ColorDesk is another CDEV that can take up a large amount of RAM. After turning off or moving INITs and CDEVs out of the System folder, restart your computer; you should find that you have more memory now in which to work.

2) If you're using System software version 6, run HyperCard under Finder instead of MultiFinder.

3) Turn off the RAM cache via the Control Panel; HyperCard doesn't use it anyway. At the least, lessen the amount of the RAM cache.

4) Allocate more memory to HyperCard via the Finder: click on the HyperCard application (while it's not running), choose Get Info from the File menu, and increase the amount of the application memory size. The absolute minimum is 1000K; if you're having memory problems, try increasing the amount by 256K increments until you are able to use the paint tools. If your stack has a script that opens a large color PICT file, you may need to increase it up to 2000K. This will allow things within HyperCard to run more smoothly. Remember, if you're running

HyperCard with increased memory and you try to open another application under MultiFinder, you may not have enough to open the second program. If you open the second one from the desktop, you'll get a "Not enough memory" message. If you try and open a second one via a script, nothing will happen.

5) Remember to put "" (or empty) into large variables when you're done with them. This is more important for systems with 1MB of RAM. Also bear in mind that you needn't use many variables when one will do: rather than using variables called name, sex, and age, you can put all four into one variable like this:

```
put "Bob Jones" into line 1 of singleVariable
put "Male" into line 2 of singleVariable
put "04/13/63" into line 3 of singleVariable
```

You can then reference an item in the variable by referring to "line 2 of singleVariable".

6) Install more RAM in your system (if you do this, you can probably skip all of the above steps.)

HyperCard 2.x: Controlling Font, Style of Pasted Text (8/92)

==========

Article Created: 29 May 1992
Article Reviewed/Updated: 26 August 1992

TOPIC --------------------

In HyperCard 2.x, text pasted into a field will paste in the Font, Size and Style of the field from which it was copied. To get pasted text to take on the attributes of the target field, hold the Shift key down while pasting.

DISCUSSION --------------------

To see this effect working from a script, create two card fields, then choose a different font and style for each. Then create a button with the following script. Enter text into card field 1, then click the button, with and without the optionKey down. (optionKey down demonstrates the shiftKey effect)

```
on mouseUp
  if the optionKey is down then
      select text of cd field 1
      doMenu "Copy Text"
      select before word 1 of cd field 2
      type "v" with commandKey,shiftKey
  else
      select text of cd field 1
      doMenu "Copy Text"
      select before word 1 of cd field 2
      type "v" with commandKey
  end if
end mouseUp
```

HyperCard: Phone Dialer Doesn't Dial Modem (7/92)

Revised: 4/6/94
Security: Everyone

HyperCard: Phone Dialer Doesn't Dial Modem (7/92)

==========

Article Created: 17 January 1992
Article Reviewed/Updated: 6 April 1994

TOPIC ----------

The Dialer generates tones, but the modem either:
- Doesn't dial.
- Hangs up too quickly.
- Doesn't hang up at all (line is faint, or conversation comes through modem speaker).

DISCUSSION ----------

Doesn't Dial

The most common cause is that the modem is waiting for a DTR (Data Terminal Ready) signal from the computer host, which is interrupted when HyperCard closes the serial connection. Modem manufacturers typically do not construct their own chip sets, but use one of about five that are made by OEMs. So various modems will share this problem, by sharing a chip set. We have observed that Zoom SupraModems, Abaton InterFax modems, and Prometheus fax modems all wait for DTR.

The solution to the DTR problem is normally to tell the modem not to bother looking at DTR. The Phone Dialer provided with HyperCard 2.1 has a ready-made option to do that. Simply open the Phone Dialer, click on the modem options button, and select the SupraModem setting. What we call the SupraModem setting will work with most of the modem types described above.

What this does is send a Hayes modem command to the modem with an instruction to ignore DTR. The command is "&D" (without quotes), and is incorporated as part of an ATD dial sequence, in the following form normally: AT&DS0=0DT. For Phone Dialers provided with versions of HyperCard BEFORE 2.1, the dial scripts themselves must modified to add the "&D" command.

Hangs Up Too Fast, or Not Fast Enough

The most common cause is that HyperCard is holding the serial connection open for an improper amount of time -- either too long or too short. This has been a longstanding problem with HyperCard, because it needed to be able to hold the serial connection open long enough to dial lengthy international numbers from the Portable, making it hang on after a regular local call has been dialed.

Finally, HyperCard 2.1 was introduced, and while it is set by default to hold the serial connection for 3 seconds, this amount of time can be modified through the use of the new dialingTime property. So a script can be written using the dialingTime to find a length congenial to the user's particular needs.

We have found that the TelePort modems require some modification of the dialingTime normally.

Different versions of HyperCard attempted different strategies with this -- some tried to send ATH commands (a Hayes modem command to hang up), or set certain registers in the modem to differing values, or change the amount of time they held the serial connection open. HyperCard 2.0v2 held the serial connection for 10 seconds; 2.0v1 held it for 3 seconds; versions of HyperCard before 2.0 held it open for differing amounts of time. None of these schemes was very successful.

HyperCard 2.0: Phone Dialer Patches (7/92)

Revised: 4/6/94
Security: Everyone

HyperCard 2.0: Phone Dialer Patches (7/92)

==========

Article Created: 15 April 1991
Article Reviewed/Updated: 6 April 1994

TOPIC ----------

HyperCard 2.0 includes the local area code when dialing a number from the Address book. The correction for this lies in modifying the dial handler of the stack script of the Phone Dialer stack.

DISCUSSION ----------

The suggested fix is that the user first enter the local area code in the field labeled "Access Number" on the dial options card in the phone dialer. Then make the following change to the dial handler in the stack script of the Phone Dialer. This change parses out the area code, if it is local.

```
on dial theNumber
          .
          .
          .
  if international <> empty then
    -- XFCN that displays a modal dialog
    get
PrefixDialog(dialogData(),longDistance,international,outsideLine,theNumber)
    if it = "Cancel" then exit dial
    put it into theNumber -- the user modified number
  else
    if char 1 to 3 of theNumber = areaCode
    then delete char 1 to 3 of theNumber
    else put longDistance before theNumber
    -- add the outside line character(s)
         .
         .
         .
end dial
```

The About section of the dial options on the Phone Dialer with 2.0 misleadingly states that there is a place on the card for the local area number. There actually is such a place, but it is misleading because the field is apparently labeled "Access Number", even though it is really named "Local Area Code".

However, putting the local area code in that field still won't solve the problem of HyperCard including the area code when dialing from the Address book. Some change like the one above must be made.

HyperCard: Flaw in Power Tools Stack (3/93)

Revised: 4/6/94
Security: Everyone

HyperCard: Flaw in Power Tools Stack (3/93)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 6 April 1994

TOPIC --------------------

Some versions of the Power Tools stack have a small flaw. This article provides the workaround.

DISCUSSION --------------------

The problem: the Show Palette button of the Window Manager card of the Power Tools stack appears to be corrupt.

The symptom: the button does not highlight and does not show the Window Manager palette.

The workaround: Copies of the button work fine.

1) Duplicate the button.

2) Delete the original.

3) Replace the original button with the duplicate copy.

HyperCard 2.x: Tips for Printing Disk Labels (11/92)

Revised: 4/6/94
Security: Everyone

HyperCard 2.x: Tips for Printing Disk Labels (11/92)

==========

Article Created: 3 April 1991
Article Reviewed/Updated: 30 November 1992

TOPIC ----------

The commonly used labels (Avery 4241) are exactly 3" high. To print them out without skipping a label or having the labels "creep", do the following.

DISCUSSION ----------

1) In the Page Setup dialog, select International Fanfold paper. This is 12-inch high paper. Also, make sure "No Breaks Between Pages" is checked.

2) In the Print Stack dialog, set the Top Margin to 0.0 inch, the Bottom Margin to as small as possible (hold down the Option key and try several times. The least you may able to attain is 0.062 inch). Set the Left Margin to as small as possible (0.093 inch) and the right margin to anything. Make sure that "space between cards" is 0.0 inch.

3) In your print script, use the "Print card from x,y to x,y" command, and adjust the top and bottom pixels until you get the correct spacing between adjacent labels. You may have to shorten the print area by 1 pixel less than what the calculated value is for 3 inches: your adjustment may vary. To make sure that only one label is printed "across", make the right-hand 'x' dimension large -- use the full width of the card, and make sure that there is only white space on each card. This works nicely, but it is far from obvious how to do it when you start working.

This article is adapted from the Claris Tech Info database.

HyperCard: Opening QuickTime Compressed PICTs (7/92)

Revised: 4/6/94
Security: Everyone

HyperCard: Opening QuickTime Compressed PICTs (7/92)

==========

Article Created: 17 April 1992
Article Reviewed/Updated: 6 April 1994

TOPIC --

The HyperCard Picture XCMD can open up compressed PICTs created with QuickTime. This is done by making a toolbox call (DrawPicture). QuickTime intercepts the call and does any decompression necessary.

DISCUSSION --

Here are some factors that seem to affect the speed of the Picture XCMD:

- The amount of RAM allocated to HyperCard -- more memory may help.

- The size of the picture file.

- The type of compression used -- JPEG compression may be a lot slower than Video compression. Note also that JPEG gives you a smaller file but may take longer to decompress.

- The parameters you pass to the Picture XCMD -- Files may display quicker if no parameter for bit-depth (fifth param) is passed. Pass a fifth parameter only if memory conservation is important. If you try to display a file at a lower bit depth, it takes time to convert. If you pass 0 for the bit-depth parameter, then the XCMD does not set up an offscreen buffer. Hence, the window will seem to appear immediately, but the picture may take some time to get drawn into the window (it is drawn as it is decompressed). This method will give you slower updates.

HyperCard: Sending Strings Using Apple Events (8/92)

Revised: 4/7/94
Security: Everyone

HyperCard: Sending Strings Using Apple Events (8/92)

==========

Article Created: 28 April 1992
Article Reviewed/Updated: 28 August 1992

TOPIC --------------------

I want to update an index over a network using identical HyperCard stacks. I use this handler:

```
on incoming data
  if data is not empty then put data into cd fld "index" of cd "topics"
end incoming
```

I send the contents of a large card to incoming by the following:

```
 send quote& cd fld "index" of cd "topics"&quote to remoteHC
```

where remote HC is the network address of the destination stack.

The script works fine in simple cases of "data". However, when sending the cd fld "index", I get an error that "Incoming could not understand QT", where QT is the first word of the second line of cd fld "index". The quotes on either end of the cd fld contents is not sufficient to distinguish the fld as a single entity; that is, everywhere I have a carriage return, the incoming handler thinks it's a separate argument and gets confused.

Sending each line of the cd fld "index" separately to avoid confusing the incoming handler works. Is there any way to send the contents of a field that has carriage returns as a single argument to a handler?

DISCUSSION --------------------

The problem is really not related to Apple events. As an example, take the same script and field and try sending them to another stack without using Apple events (send "blah blah blah" to stack "blah"). You will find that returns can not be part of a string parameter when sent to another stack. Therefore the problem is caused by this constraint and not by an Apple

event constraint.

Here are two recommendations for avoiding the problem.

First, create an "on AppleEvent" handler at the stack level of the receiving stack. With this created you simply send the whole field to your receiving stack.

```
  on mouseUp
    send cd fld "data" to program otherApp
  end mouseUp
```

When the "AppleEvent" handler is activated in your receiving stack, you simply extract the contents of the sent field from the "data" parameter and put it into your location field.

```
on AppleEvent
  request AppleEvent data
  put it into cd fld "myField"
end AppleEvent
```

The only problem with this solution is that all Apple events will be trapped by this handler. If you are only planning on sending one Apple event or you are willing to parse out all potential Apple events in this handler, this solution is OK. If not you might want to try the next solution.

Using the same "incoming" handler you presently have, change the nature of the "data" parameter to represent the id (or number or name) of the field in the sending stack which holds the data. Then, in the "incoming" handler request the contents of this field from the sending stack. For example:

```
on incoming data
  request data from program sendingProgram
end incoming
```

The script you would use in the sending stack would look something like this:

```
on mouseUp
  answer program ""
  put it into otherApp
  send (incoming & quote & "cd fld id 1" & quote) to program otherApp¬
  without reply
end mouseUp
```

HyperCard: Network Communication (8/93)

==========

Article Created: 13 June 1993
Article Reviewed/Updated: 6 April 1994

TOPIC --

How I can link one HyperCard stack on one Macintosh with another HyperCard stack on another Macintosh?

DISCUSSION --

There are several approaches to communicating between stacks on different Macintoshes or creating a multi-user stack which uses a client/server model.

- APDA (Apple Developer's Association) sells an AppleTalk Toolkit which includes XCMDs, XFCNs, and source code to enable stacks to interact via AppleTalk.

- epsiTalk 2.0 is a set of XCMDs which provide multi-user features. It enables you to make a stack multi-user and also includes an E-Mail system, real-time conferencing, and a mechanism to transfer files between Macintoshes.

- HyperCard can send and receive do script Apple Events. By sending an Apple Event to another Macintosh running HyperCard, it's possible to use Apple Events to pass data and commands between Macintosh computers. Refer to the Apple Event Primer Stack for more information.

HyperCard: Converting 2.x Stacks Back to 1.2.5 (11/92)

Revised: 4/6/94
Security: Everyone

HyperCard: Converting 2.x Stacks Back to 1.2.5 (11/92)

==========

Article Created: 6 May 1991
Article Reviewed/Updated: 6 Apr 1994

TOPIC ----------

It is not possible to convert a HyperCard 2.x stack to 1.x format using HyperCard alone. It is always a good idea to convert a copy of a 1.2.5 stack rather than the original. However, a utility named UnConvert from Heizer Software can perform this task.

DISCUSSION ----------

UnConvert converts stacks from 2.x format back to 1.2.5. Of course, if a script uses any of the new 2.x features, those features will not be supported. If [the card size of] a 2.x stack is larger than [that of] a 1.2.5 stack, objects that would be off the card are moved onto the card, and any graphics will be clipped.

To locate a vendor's address and phone numbers, use the vendor's name as a search string.

HyperCard: Waiting for a QuickTime Movie to Finish (3/93)

==========

Article Created: 29 January 1993
Article Reviewed/Updated: 6 April 1994

TOPIC --------------------

The ability to play QuickTime movies in HyperCard is made possible using HyperCard's XCMD interface. XCMDs are basically little programs that can be executed using the HyperTalk language. Because they are separate programs, however, they can execute concurrently with other HyperCard scripts. A good example of this is the Movie XCMD provided in the QuickTime Tools stack. All commands in a handler following a Play command will execute while the movie is playing.

But what if I want to wait for the movie to finish before executing the rest of my handler?

DISCUSSION --------------------

The Movie XCMD allows you to set a callBackMsg property which will be automatically sent when the movie completes. You can use this command to execute another handler when the movie completes.

Button script example:

```
on mouseUp
  global TheMovieName
  put "Claris Logo Movie" into TheMovieName
  put the number of me into myButton
  Movie TheMovieName,"Windoid","Card","Visible","Floating"
  set the callBackMsg of window theMovieName to ¬
  "send movieFinished to cd btn" && myButton
  send "Play" to window TheMovieName
end mouseUp

on movieFinished
  global TheMovieName
```

```
  answer "The movie is done!"
  close window TheMovieName
end movieFinished
```

System 7: Making an Emergency Startup Disk (7/96)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 01 Jul 1996

TOPIC ----------

This article tells you what to do if Norton Utilities or another vendor's emergency startup disk fails or isn't compatible with Macintosh models that require a System Enabler. Follow these instructions to create a startup disk (emergency boot disk) to use with any Macintosh model running versions of System 7.

DISCUSSION ----------

Usually there isn't enough room on a 1.44MB floppy disk for System, Finder, AND an application. Here are instructions on how to make them fit on a floppy disk:

1) Run the system software Installer for the type of Macintosh you have. It doesn't matter if your Macintosh came with system software on floppy disk (Install Me First disk) or on a CD-ROM. If you install from a floppy disk, expect some disk swapping (the program ejects a disk and asks you to insert another disk).

2) Install a "Minimum" System (for your specific Macintosh) on a 1.44 MB floppy disk. You can find this in the Custom installation options. This gives you the smallest possible System file, which should be under 750K for system software version 7.1.

3) Move the System file and System Enabler (if your Macintosh needs one) out of the System Folder to the root level of the disk (the same level as the System Folder). Drag the rest of the System Folder to the Trash, AND choose Empty Trash from the Special menu.

4) Copy your application to the disk and change the application's name to Finder. You should have three items on the disk:

   • System

- System Enabler (if needed)
- Finder (which is really your application now)

It is important that these items are at the root level of the disk and not within a System Folder, other folder, or on the desktop.

5) Restart your Macintosh with the startup disk you just created. Your Macintosh should start up in the application you placed on the floppy disk.

Security: Everyone

Power Macintosh 6100/60: Description (Discontinued)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 29 August 1995

TOPIC ----------

The Power Macintosh 6100/60 is a high performance Macintosh model incorporating the new PowerPC 601 RISC processor.

DISCUSSION ----------

Overview

The Power Macintosh 6100/60 and Power Macintosh 6100/60AV are the most affordable members of the new high-performance line of Macintosh computers that use the revolutionary PowerPC chip technology. With this technology, they deliver the performance that business and education users demand while maintaining the legendary Macintosh ease of use and the ability to run virtually all existing Macintosh applications.

In addition, Power Macintosh computers run applications written to take advantage of Power Macintosh capabilities at two to six times the speed of previous Macintosh computers based on the 040 chip. Both computers also support MS-DOS and Windows applications when using SoftWindows software.

Based on the 60-megahertz PowerPC 601 microprocessor co-developed by Apple, IBM, and Motorola, the Power Macintosh 6100/60 and 6100/60AV both have built-in, floating-point math coprocessors and come with 8 megabytes of RAM, expandable to up to 72 megabytes. They also provide on-board high-speed Ethernet support.

Both computers support most Apple and third-party displays, including monochrome, color, VGA, and SVGA. The 6100/60AV supports 32,000 colors on all Apple displays and also supports NTSC and PAL monitors.

Both computers can easily be expanded. The Power Macintosh 6100/60 has eight built-in ports and one expansion slot. The Power Macintosh 6100/60AV has eleven built-in ports and supports a second simultaneous display.

Support for GeoPort telecommunications (integrating your phone and your computer), speech-recognition, and text-to-speech capabilities is built into both computers (PlainTalk software and microphone required). The 6100/60AV adds S-video and composite video input as well as output for use with televisions, video cameras, and video recorders.

The Power Macintosh 6100/60 and Power Macintosh 6100/60AV provide an affordable gateway to Power Macintosh technology—and the future of personal computing.

Power and Speed

- 60-MHz PowerPC 601 RISC Processor

Memory

- 4 MB ROM
- 256 bytes of non-volatile parameter memory
- 8 MB of RAM standard, expandable to 72 MB
- 2 SIMM slots
- SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs of the same size AND speed. For example, you should install two 8 MB SIMMs in first two adjoining slots.
- Possible RAM configurations are 8 MB, 16 MB, 24 MB, 40 MB, and 72 MB.
- 80 ns SIMMs or faster
- L2 Cache Slot for Optional Macintosh Cache Card

RAM note: All 8MB RAM configurations come with 8MB of RAM soldered onto the logic board

Display

- New AV Display Connector supports the Apple AudioVision 14 Display. The bundled Video Adapter Cable (Part #M2681LL/A) allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video.
- DRAM based video: 16 bit on 14-inch monitors, 8 bit on 16-inch monitors. 640k of DRAM based video is not expandable.
- VRAM based video: No VRAM video support or expansion.

Audio System

- Custom sound circuitry, including stereo generator capable of driving stereo miniplug headphones or audio equipment. Also includes stereo sampling hardware for recording samples.

Expansion

- Eight built-in ports to support a wide range of peripherals
- One 601 PDS (Processor Direct Slot)
- One NuBus 90 Slot for additional expansion cards Accomodates one 7-inch NuBus card when the optional Power Macintosh 6100 NuBus Adapter Card (Part #M2337LL/A) is installed.

• Optional internal CD-ROM drive (such as AppleCD 300i Plus)

System software

• System 7 for Power Macintosh with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

• Built-in AppleTalk networking
• File sharing without a dedicated server
• On-board Ethernet networking

Compatibility

• Reads Macintosh, MS-DOS, and OS/2 floppy disk formats

What's in the box:

Each unit includes a power cord, keyboard cable, mouse, microphone, and system software.

System software includes System 7.1.2 for Power Macintosh, System Enabler, Color Macintosh Basics, AppleScript 1.1, QuickTime 1.6.2, and HyperCard Runtime 2.2.

System software shipped on a bootable CD-ROM, the "Install Me First CD" which can double as a rescue disk.#

Documentation included with the Power Macintosh 6100/60:
• Power Macintosh Getting Started
• Technical Information
• Macintosh Reference
• AppleCD 300i Plus User's Guide#

- CD-ROM and AppleCD 300i Plus User's Guide bundled with configurations which include an internal CD-ROM drive.

Configurations and Ordering Information:

• Power Macintosh 6100/60
  - Power Macintosh 6100/60 computer with 8MB of RAM, built-in 1.4MB Apple SuperDrive, internal 160MB hard disk drive and Power Macintosh Display Adapter: Order No. M2196LL/A
  - With 8MB of RAM, 250MB hard disk, and internal CD-ROM drive: Order No. M1878LL/A
  - With 16MB of RAM, 250MB hard disk, and SoftWindows software: Order No. M3078LL/A
• Power Macintosh 6100/60av
  - Power Macintosh 6100/60av computer with 8MB of RAM, 2MB of VRAM, built-in 1.4MB Apple SuperDrive, internal 250MB hard disk, internal CD-ROM drive, and two S-video to composite video adapters: Order No. M2738LL/A

- Power Macintosh GeoPort Telecom Adapter
  Order No. M3127LL/A

- PlainTalk for Power Macintosh: Includes PlainTalk software and the PlainTalk microphone (required for speech recognition and text-to-speech capabilities). Order No. M2844LL/A

- Power Macintosh 6100 NuBus Adapter Card (Part #M2337LL/A)
  This card gives you the ability to plug in a 7-inch NuBus expansion card. There are dozens of such NuBus cards available to enhance your computer's capability in areas like video, networking and performance. You can find these cards at your local Apple Authorized Dealer.

Note: This card will not work with the Power Macintosh 6100/60AV, since the slot it plugs into is already loaded with the video I/O card.

- Power Macintosh Cache Card (Part #M2385LL/A)
  This card enhances performance by providing a large block of very fast memory for the processor to access directly. Use it to get optimum system performance.

- Macintosh Memory Expansion Kits
  Adding DRAM allows you to run more applications simultaneously. It also increases overall system performance. All models of the Power Macintosh 6100 have two DRAM SIMM slots (Single In-line Memory Module). These must both be filled with the same size SIMMs; i.e. two 4MB SIMMs, two 8MB SIMMs, two 16MB SIMMs or two 32MB SIMMs (16MB and 32MB SIMMs available from third-party vendors).
  - 4MB (1-4MB SIMM)
    Order No. M1507LL/A
  - 8MB (1-8MB SIMM)
    Order No. M1508LL/A

- Video Adapter Cable (Part #M2681LL/A)
  This cable allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video. This cable is offered as an option for the Power Macintosh 6100/60AV only; it comes standard with every Power Macintosh 6100/60.

Power Macintosh 7100/66: Description (Discontinued)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 13 June 1995

TOPIC ----------

The Power Macintosh 7100/66 is a performance Macintosh model incorporating the new PowerPC 601 RISC processor.

DISCUSSION ----------

Overview

The Power Macintosh 7100/66 and Power Macintosh 7100/66AV are the expandable, mainstream members of the new high-performance line of Macintosh computers based on PowerPC chip technology. They’re built with the speed, expandability, and networking capabilities that business people require for word processing, desktop publishing, and working with complex spreadsheets and databases.

Although they use fast new technology, these computers run virtually all existing Macintosh applications. In addition, Power Macintosh computers run applications written for Power Macintosh at two to six times the speed of previous Macintosh computers. And the 7100/66 and 7100/66AV can run 10 to 25 percent faster than the Power Macintosh 6100/60 computer. Both computers can also run MS-DOS and Windows applications using SoftWindows software.

Based on the 66-megahertz PowerPC 601 microprocessor codeveloped by Apple,IBM, and Motorola, the Power Macintosh 7100/66 and 7100/66AV both have built-in, floating-point math coprocessors. They also provide built-in, high-speed Ethernet networking.

Both computers support all Apple and most third-party displays, including monochrome, color, VGA, and SVGA. Support for up to 32,000 colors on Apple color displays (up to 16- or 17-inch) is included with the 7100/66. The 7100/66AV (and the 7100/66 with the addition of 1 megabyte of VRAM) supports display of more than 16 million colors.

Both computers feature easy expandability via three NuBus slots, and you can run two simultaneous displays with each.

GeoPort telecommunications capabilities can integrate both computers with your phone, and both feature speech-recognition and text-to-speech capabilities (PlainTalk microphone and software required to utilize these features). The 7100/66AV adds S-video and composite video input as well as output for use with televisions, video cameras, and video recorders.

For high-performance and expandability in a platform that's built for the future, the Power Macintosh 7100/66 and Power Macintosh 7100/66AV are designed to meet your needs.

Power and Speed

- 66-MHz PowerPC 601 RISC Processor
- Integrated floating-point unit and 32K cache

Memory

- 4 MB ROM
- 256 bytes of non-volatile parameter memory
- 8 MB of RAM standard, expandable to 136 MB
- 4 SIMM slots
- SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs of the same size AND speed. For example, you should install two 8 MB SIMMs in first two adjoining slots.
- Possible RAM configurations are 8 MB, 24 MB, 40 MB, 72 MB, and 136 MB.
- 80 ns SIMMs or faster
- L2 Cache Slot for Optional Macintosh Cache Card

RAM note: All 8MM RAM configurations come with 8MB of RAM soldered onto the logic board

Display

- New AV Display Connector supports the Apple AudioVision 14 Display. A Video Adapter Cable (Part #M2681LL/A) allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video.
- 1 MB of VRAM standard, upgradeable to 2 MB

Audio System

- Custom sound circuitry, including stereo generator capable of driving stereo miniplug headphones or audio equipment. Also includes stereo sampling hardware for recording samples.

Expansion

- Eight built-in ports to support a wide range of peripherals
- One 601 PDS (Processor Direct Slot)
- Three NuBus 90 Slots for additional expansion cards

• Optional internal CD-ROM drive (such as AppleCD 300i Plus)

System software

• System 7 for Power Macintosh with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

• Built-in AppleTalk networking
• File sharing without a dedicated server
• On-board Ethernet networking

Compatibility

• Reads Macintosh, MS-DOS, and OS/2 floppy disk formats

What's in the box:

Each unit includes a power cord, keyboard cable, mouse, microphone, and system software.

System software includes System 7.1.2 for Power Macintosh, Color Macintosh Basics, AppleScript 1.1, QuickTime 1.6.2, and HyperCard Runtime 2.2.

System software shipped on a bootable CD-ROM, the "Install Me First CD" which can double as a rescue disk.#

Documentation included with the Power Macintosh 7100/66:
• Power Macintosh Getting Started
• Technical Information
• Macintosh Reference
• AppleCD 300i Plus User's Guide#

- CD-ROM and AppleCD 300i Plus User's Guide bundled with configurations which include an internal CD-ROM drive.

Configurations and Ordering Information:

• Power Macintosh 7100/66:
  - Power Macintosh 7100/66 computer with 8MB of RAM, 1MB of VRAM, built-in 1.4MB Apple SuperDrive, and internal 250MB hard disk:
    Order No. M2464LL/A
  - With 8MB of RAM, 250MB hard disk, and internal CD-ROM drive:
    Order No. M2465LL/A
  - With 16MB of RAM, 250MB hard disk, and SoftWindows software:
    Order No. M3077LL/A

• Power Macintosh 7100/66AV:
  - Power Macintosh 7100/66AV computer with 8MB of RAM, 2MB of VRAM, built-in 1.4MB Apple SuperDrive, internal 500MB hard disk drive, internal CD-ROM drive, and two S-video to composite video adapters:
    Order No. M2467LL/A

- Macintosh VRAM Expansion Kit (2-256K SIMMs) Order No. M5953LL/A
  Note: This upgrade does not apply to the Power Macintsoh 7100/66 AV which is already configured with its full complement of 2MB VRAM.

- Power Macintosh GeoPort Telecom Adapter
  Order No. M3127LL/A

- PlainTalk for Power Macintosh: Includes PlainTalk software and the PlainTalk microphone (required to utilize text-to-speech and speech recognition features). Order No. M2844LL/A

- Power Macintosh Cache Card (Part #M2385LL/A)
  This card enhances performance by providing a large block of very fast memory for the processor to access directly. Use it to get optimum system performance.

- DRAM upgrades: All models of the Power Macintosh 8100 have eight DRAM SIMM slots (Single In-line Memory Module). SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs (16MB and 32MB SIMMs available from third-party vendors).
  - 4MB (1-4MB SIMM) Order No. M1507LL/A
  - 8MB (1-8MB SIMM) Order No. M1508LL/A

- Video Adapter Cable (Part #M2681LL/A)
  This cable allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video. You can use it if you want to connect an additional display (other than the Apple AudioVision 14) to your computer.

Article Change History:
13 Jun 1995 - Reviewed for technical accuracy.
17 May 1994 - Updated to clarify PlainTalk requirements and remove unavailable configurations and products.
11 Mar 1994 - Reclassified for public access.

Power Macintosh 6100/60: Specifications (Discontinued)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 29 August 1995

TOPIC -----

This article gives the technical specifications for the Power Macintosh 6100/60 computer.

DISCUSSION -----

Microprocessor

- 60-MHz PowerPC 601 RISC Processor

Memory

- 4 MB ROM
- 256 bytes of non-volatile parameter memory
- 8 MB of RAM standard, expandable to 72 MB
- 2 SIMM slots (1 pair)
- 80 ns (nanosecond) SIMMs or faster
- SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs of the same size. For example, you should install two 8 MB SIMMs in first two adjoining slots.
- Possible RAM configurations are 8, 16, 24, 40 and 72 MB.
- L2 Cache Slot for Optional 256K Macintosh Cache Card

RAM note: All 8MM RAM configurations come with 8MB of RAM soldered onto the logic board

Form Factor

- Modular desktop enclosure (similar to Quadra 610, 660av enclosure)

Disk Drives

- One Built-in Apple SuperDrive 1.4 MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.
- Support for one internal one-third, 5.25-inch height SCSI devices, one of which may be used for removable media, such as an internal CD-ROM drive.
- One internal one-third height hard disk (250MB, 350MB options available)
- Optional internal Apple CD-ROM drive (see above)
- Optional external SCSI hard disk drive (many capacities available)

Video Display

- 640k of DRAM based video: 16 bit on 14-inch monitors, 8 bit on 16-inch monitors. DRAM based video is not expandable. (The table below details support for specific monitors.)
- VRAM based video: No VRAM video support or expansion.

Begin_Table

Monitor:	Resolution:	Colors or Grays:
12-inch Color	512 by 384	thousands
12-inch Monochrome	640 by 480	256
13-inch or 14-inch Color or VGA	640 by 480	thousands
15-inch Portrait Monochrome	640 by 870	256
16-inch Color	832 by 624	256

Note: Built-in video (HDI-45 with 640K DRAM support) doesn't support any monitor with a resolution greater than 832 by 624. To use a larger monitor (19-inch, 20-inch, or 21-inch), a third-party video card or the AV card must be used.

End_Table

Interfaces

- One internal Nubus 90 PDS. Supports block transfers to and from main memory, 2x block transfers card to card. There is a NUBUS adapter for the Power Macintosh 6100. A NuBus card requires an adapter card & bracket. There is only one slot, so it supports one PDS card OR one NuBus card.
- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices.
- One AAUI-15 Ethernet connector.
- Two serial (RS-232/RS-422) ports.
  (1 Printer/LocalTalk, 1 Modem, both support GeoPort)
- SCSI interface for connecting up to a total of seven SCSI devices.
- Sound output port for stereo compact disc audio and stereo computer-generated sound.
- Sound input port for stereo sound input (supports 16-bit stereo audio)
- One AV Display Connector supports the Apple AudioVision 14 Display. The bundled Video Adapter Cable (Part #M2681LL/A) allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video.
- One internal 601 PDS (processor direct slot)

- One internal L2 (Level 2) cache slot

Audio System

- 16-bit stereo in and out
- Sample rates of 48, 44.1, 24, 22.05 kilohertz (kHz)
- Input line level: 1 volt peak-to-peak
- Output line level: 1 volt peak-to-peak
- Input SNR (signal-to-noise ratio): 82 decibels (dB) with no audible discrete tones
- Output SNR: 85 dB with no audible discrete tones
- Bandwidth: 20 Hz-20 kHz (+/- 2 dB) at 44.100 kHz sample rate
- THD+N (Total harmonic distortion plus noise): Less than 0.05 percent; measured 20 Hz-20kHz with a 1-Vrms sine wave input.

Networking

- Built-in Ethernet
- Serial port for AppleTalk
- Integrated GeoPort telecommunications architecture for data, fax, and voice connectivity.

Keyboard

- Several Apple Desktop Bus keyboards with numeric key pads available.

Mouse

- Apple Desktop Bus Mouse II; mechanical tracking, optical shaft, or contact encoding.

Clock/Calendar

- CMOS custom chip with long-life lithium battery.

Apple PlainTalk Microphone (optional)

- The microphone is unidirectional and optimized for use with speech recognition.

Disability Access

- Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 100 to 240 VAC, RMS single phase, automatically configured
- Frequency: 50 to 60 hertz, single phase
- Power Supply Output Rating (Power available for internal devices)
  - Continuous output 86W

• A/C Line Input (Power drawn by the Power Macintosh 6100/60)
  - Maximum continuous 132W
  - Peak input 201W

ADB Power Requirements

• Maximum current draw for all ADB devices: 500 milliamps (a maximum of three Apple Desktop Bus devices is recommended)
• Mouse draws 10 milliamps.
• Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Size and Weight

Main unit

• Height: 3.4 inches (8.5 cm)
• Width: 16.3 inches (41.5 cm)
• Depth: 15.6 inches (39.7 cm)
• Weight*: 14.0 pounds (6.4 kg)

*Weight varies based on internal devices installed

Mouse

• Height 1.3 inches (33 mm)
• Width 2.4 inches (61.7 mm)
• Depth 4.2 inches (107.3 mm)
• Weight 4 ounces (0.10 kg)

Operating Environment

• Operating temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
• Storage temperature: -40 degrees to 116.6 degrees F (-40 degrees to 47 degrees C)
• Relative humidity: 5% to 95% noncondensing
• Maximum altitude: 10,000 ft. (3,048m)

System Software Requirements

Requires System 7.1.2 for Power Macintosh or later and the accompanying System Enabler.

Article Change History:
29 Aug 1995 - Formatted for better online viewing.
29 Sep 1994 - Documented hard drive sizes, availability of AV Card upgrade.
23 Aug 1994 - Additional power supply ratings documented.

Power Macintosh 8100/80: Description (Discontinued)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 13 June 1995

TOPIC ----------

The Power Macintosh 8100/80 is the highest performance Macintosh incorporating the new PowerPC 601 RISC processor.

DISCUSSION ----------

Overview

The Power Macintosh 8100/80 and Power Macintosh 8100/80AV deliver the highest performance and speed ever in Macintosh computers. These racehorse computers are designed to meet the speed, expansion, and networking needs of the most demanding Macintosh power users, from professional publishers to computer-aided design professionals.

Although based on new technology, these computers support virtually all existing Macintosh applications. In addition, Power Macintosh computers run applications written for Power Macintosh at two to six times the speed of previous Macintosh computers. And the 8100/80 and 8100/80AV can run 50 to 100 percent faster than the Power Macintosh 6100/60 computer. Both computers can also run MS-DOS and Windows applications when using SoftWindows software.

Based on the 80-megahertz PowerPC 601 microprocessor co-developed by Apple, IBM, and Motorola, the Power Macintosh 8100/80 and 8100/80AV both have built-in, floating-point math coprocessors. They also provide built-in, high-speed Ethernet networking.

Both computers support all Apple and most third-party displays, including monochrome, color, VGA, and SVGA. Support for 16.7 million colors on Apple color displays (up to 16- or 17-inch) is included with the 8100/80 and the 8100/80AV. The 8100/80, with the addition of 2 megabytes of VRAM (to total 4 megabytes) supports display of more than 16 million colors.

Both computers feature easy expandability via three NuBus slots, and you can run two simultaneous displays with each.

GeoPort telecommunications capabilities can integrate both computers with your phone, and both feature speech-recognition and text-to-speech capabilities (PlainTalk microphone and software required). The 8100/80AV adds S-video and composite video input as well as output for use with televisions, video cameras, and video recorders.

The Power Macintosh 8100/80 and Power Macintosh 8100/80AV provide the most power and speed ever available in a Macintosh computer. And they come with the flexibility and expandability necessary to build a firm foundation for your future computing needs.

Power and Speed

- 80-MHz PowerPC 601 RISC Processor
- Integrated floating-point unit and 32k cache

Memory

- 4 MB ROM
- 256 bytes of non-volatile parameter memory
- 8 MB of RAM standard, expandable to 264 MB
- 8 SIMM slots
- SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs of the same size AND speed. For example, you should install two 8 MB SIMMs in first two adjoining slots.
- Possible RAM configurations are 8 MB, 40 MB, 72 MB, 136 MB and 264 MB.
- 80 ns SIMMs or faster
- L2 Cache Slot with preinstalled Macintosh Cache Card

RAM note: All 8MB RAM configurations come with 8MB of RAM soldered onto the logic board

Display

- New AV Display Connector supports the Apple AudioVision 14 Display. A Video Adapter Cable (Part #M2681LL/A) is available as an option to allow connecting an additional monitor with a standard DB-15 connector to your Power Macintosh built-in video.
- Works with all Apple monitors as well as third-party displays including VGA and SVGA. AV configurations also support NTSC and PAL.
- 2 MB of VRAM standard, upgradeable to 4 MB on the PDS card with standard DB-15 monitor connector

Expansion

- Eight built-in ports to support a wide range of peripherals
- One 601 PDS (Processor Direct Slot)
- Three NuBus 90 Slots for additional expansion cards
- Optional internal CD-ROM drive (such as AppleCD 300i Plus)

System software

• System 7 for Power Macintosh with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

• Built-in AppleTalk networking
• File sharing without a dedicated server
• On-board Ethernet networking

Compatibility

• Reads Macintosh, MS-DOS, and OS/2 floppy disk formats

What's in the box:

Each unit includes a power cord, keyboard cable, mouse, microphone, and system software.

System software includes System 7.1.2 for Power Macintosh, Color Macintosh Basics, AppleScript 1.1, QuickTime 1.6.2, and HyperCard Runtime 2.2.

System software shipped on a bootable CD-ROM, the "Install Me First CD" which can double as a rescue disk.#

Documentation included with the Power Macintosh 8100/80:
• Power Macintosh Getting Started
• Technical Information
• Macintosh Reference
• AppleCD 300i Plus User's Guide#

- CD-ROM and AppleCD 300i Plus User's Guide bundled with configurations which include an internal CD-ROM drive.

Configurations and Ordering Information:

• Power Macintosh 8100/80:
  - Power Macintosh 8100/80 computer with 8MB of RAM, 2MB of VRAM, built-in 1.4MB Apple SuperDrive, and internal 250MB hard disk drive: Order No. M1884LL/A
  - With 8MB of RAM, 250MB hard disk, and internal CD-ROM drive: Order No. M1880LL/A
  - With 16MB of RAM, 500MB hard disk, and SoftWindows software: Order No. M3079LL/A
  - With 16MB of RAM, 1GB hard disk, and internal CD-ROM drive: Order No. M2297LL/A

• Power Macintosh 8100/80AV*
  - Power Macintosh 8100/80AV computer with 16MB of RAM, 2MB of VRAM, built-in 1.4MB Apple SuperDrive, internal 500MB hard disk drive, internal CD-ROM drive, and two S-video to composite video adapters: Order No. M2293LL/A

- Power Macintosh GeoPort Telecom Adapter
  Order No. M3127LL/A

- PlainTalk for Power Macintosh: Includes PlainTalk software and the PlainTalk microphone (required to utilize text-to-speech and speech recognition features). Order No. M2844LL/A

- DRAM upgrades: All models of the Power Macintosh 8100 have eight DRAM SIMM slots (Single In-line Memory Module). SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs (16MB and 32MB SIMMs available through third-party vendors).
  - 4MB (1-4MB SIMM)
    Order No. M1507LL/A
  - 8MB (1-8MB SIMM)
    Order No. M1508LL/A

- Power Macintosh 8100 VRAM upgrade kit (Part M1311LL/A)
  Adding VRAM increases the number of colors which can be displayed on large monitors. For example, adding VRAM to the Power Macintosh 8100/80 increases the number of colors which can be viewed on a 21-inch monitor from 32,000 to over 16.7 million. The kit upgrades the standard 2MB VRAM to 4MB VRAM.

  Note: This upgrade does not apply to the Power Macintsoh 8100/80 AV which is not expandable over the standard configuration of 2MB VRAM.

- Video Adapter Cable (Part M2681LL/A)
  This cable allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video. You can use it if you want to connect an additional display (other than the Apple AudioVision 14) to your computer.

Article Change History:
13 Jun 1995 - Reviewed for technical accuracy.
17 May 1994 - Updated to remove unavailable configurations and products.
Clarified ProDos support and PlainTalk requirements.
11 Mar 1994 - Revised "What's in the box" section and reclassified for public access.

Power Macintosh 8100/80: Specifications (Discontinued)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 20 November 1995

TOPIC ----------

This article gives the technical specifications for the Power Macintosh 8100/80 computer.

DISCUSSION ----------

Microprocessor

- 80-MHz PowerPC 601 RISC Processor

Memory

- 4 MB ROM
- 256 bytes of non-volatile parameter memory
- 8 MB of RAM standard, expandable to 264 MB
- 8 SIMM slots (4 pairs)
- SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs of the same size. For example, you should install two 8 MB SIMMs in first two adjoining slots, and two 4 MB SIMMs in the remaining two slots for a 32 MB machine.
- Possible RAM configurations are 8 MB, 16 MB, 24 MB, 32 MB, 40 MB, 48 MB, 56 MB, 64 MB, 72 MB, 80 MB, 96 MB, 104 MB, 120 MB, 136 MB, 168 MB, 200 MB, 216 MB and 264 MB.
- 80 ns SIMMs or faster
- L2 Cache Slot with Macintosh 256k Cache Card included

RAM note: All 8MB RAM configurations come with 8MB of RAM soldered onto the logic board

Form Factor

- Desktop Mini Tower (similiar to Quadra 800, Quadra 840 case)

Disk Drives

- One Built-in Apple SuperDrive 1.4 MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, and OS/2 disks.
- Support for three internal SCSI devices, one of which may be used for a one-half height, 5.25-inch removable media drive, such as an internal CD-ROM drive.
- One internal hard disk (xxx MB options available)
- Optional internal Apple CD-ROM drive (see above)
- Optional external SCSI hard disk drive (many capacities available)

Video Display

- DRAM based video: 16 bit on 14-inch monitors, 8 bit on 16-inch monitors
- VRAM based video: 2MB: 24 bit on 16-inch monitors, 16 bit on 21-inch monitors. 4MB: 24 bit on 21-inch monitors

Monitor:	Resolution:	2 MB VRAM:	4 MB VRAM:
12-inch Color	512 by 384	millions	millions
12-inch Monochrome	640 by 480	256	256
13-inch or 14-inch Color or VGA	640 by 480	millions	millions
13-inch Color	640 by 400	millions	millions
15-inch Portrait Monochrome	640 by 870	256	256
16-inch Color	832 by 624	thousands	millions
19-inch Color	1024 by 768	thousands	millions
21-inch Color	1152 by 870	thousands	millions
SuperVGA	800 by 600	thousands	millions
NTSC	640 by 480	thousands	millions
NTSC flicker-free	640 by 480	256	256
NTSC	512 by 384	thousands	millions
NTSC flicker-free	512 by 384	256	256
PAL	768 by 576	thousands	millions
PAL flicker-free	768 by 576	256	256
PAL	640 by 480	thousands	millions
PAL flicker-free	640 by 480	256	256

*NOTE- NTSC and PAL video modes supported on AV configurations only.

Interfaces

- Three internal Nubus 90 slots, support block transfers to and from main memory, 2x block transfers card to card.
- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices.
- One AAUI-15 Ethernet connector.
- Two serial (RS-232/RS-422) ports. (Printer & Modem/GeoPort)
- SCSI interface for connecting up to a total of seven SCSI devices.
- Sound-out port for stereo playback from CDs or Macintosh audio applications
- Stereo sound-input port (supports 16-bit stereo audio)
- One AV Display Connector supports the Apple AudioVision 14 Display.

- The available Video Adapter Cable (Part #M2681LL/A) allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video.
- One internal 601 PDS (processor direct slot)
- One internal L2 (Level 2) cache slot

Audio System

- 16-bit stereo in and out
- Sample rates of 48, 44.1, 24, 22.05 kilohertz (kHz)
- Input line level: 1 volt peak-to-peak
- Output line level: 1 volt peak-to-peak
- Input SNR (signal-to-noise ratio): 82 decibels (dB) with no audible discrete tones
- Output SNR: 85 dB with no audible discrete tones
- Bandwidth: 20 Hz-20 kHz (+/- 2 dB) at 44.100 kHz sample rate
- THD+N (Total harmonic distortion plus noise): Less than 0.05 percent; measured 20 Hz-20kHz with a 1-Vrms sine wave input.

Networking

- Built-in Ethernet
- Serial port for AppleTalk
- Integrated GeoPort telecommunications architecture for data, fax, and voice connectivity.

Keyboard

- Several Apple Desktop Bus keyboards with numeric keypads available.

Mouse

- Apple Desktop Bus Mouse II; mechanical tracking, optical shaft, or contact encoding.

Clock/Calendar

- Custom integrated circuit with long-life lithium battery.

Apple PlainTalk Microphone

- The microphone is unidirectional and optimized for use with speech recognition. (Microphone bundled with all AV units sold in the USA, available as a separate item outside the USA.)

Disability Access

- Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 100 to 240 VAC, RMS single phase, automatically configured
- Frequency: 50 to 60 hertz, single phase
- Power Supply Output Rating (Power available for internal devices)
  - Continuous output 200W

- A/C Line Input (Power drawn by the Power Macintosh 8100/80)
  - Maximum continuous 298W
  - Peak input 453W

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three Apple Desktop Bus devices is recommended)
- Mouse draws 10 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Size and Weight

Main unit

- Height 14.25 inches (46.2 cm)
- Width 8.9 inches (22.5 cm)
- Depth 16 inches (40.5 cm)
- Weight 24 lb. (16.7 kg) varies with disk drive options installed

Mouse

- Height 1.3 inches (33 mm)
- Width 2.4 inches (61.7 mm)
- Depth 4.2 inches (107.3 mm)
- Weight 4 ounces (0.10 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F (-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048m)

System Software Requirements

Requires System 7.1.2 for Power Macintosh or later and the accompanying System Enabler.

Article Change History:

Newton Connection Kit for Windows: VCD.386 Errors (1/94)

Revised: 1/27/94
Security: Everyone

Newton Connection Kit for Windows: VCD.386 Errors (1/94)

==========

Article Created: 27 January 1994

TOPIC -----

I recently installed the Newton Connection Kit for Windows on my Windows-compatible computer. When Windows launches on my computer, I get the following error message:

"Can not find the device file that may be needed to run Windows in 386 Enhanced mode. You need to run setup program again to install VCD.386. Press any key to continue"

Also, the Newton Connection Kit doesn't work with my Newton and my computer's fax modem doesn't work. How can I make my system work properly?

DISCUSSION -----

This problem occurs with version 1.0 of the Newton Connection Kit for Windows. Version 1.0a of the Newton Connection Kit for Windows will solve this problem and is available from the Newton System Update line at 1-800-242-3374. You can also use a workaround with Version 1.0 to cure this problem.

Problem

When you install Newton Connection Kit for Windows v 1.0, the installer looks for a statement in the SYSTEM.INI file referencing the file VCD.386. In standard Windows installations, this statement is in the 386ENH section of the SYSTEM.INI file and is written as:

device=*vcd

This statement tells Windows to look for a file called VCD.386 in the Windows system directory.

If this statement is missing from the SYSTEM.INI file, the Newton Connection Kit installer will add the following statement to the file:

device=vcd.386

Certain communications software and particular machines (usually laptops with PCMCIA slots) modify the SYSTEM.INI file and place a modified version of the file VCD.386 in the Windows system directory. Often, this modified version is NOT named VCD.386. This will cause the problems mentioned above.

Solution

You can use Version 1.0a of the Newton Connection Kit for Windows. It does not make the changes mentioned above and assumes that a VCD.386 file or equivalent is being loaded.

You can also use a workaround with Version 1.0. It restores the old SYSTEM.INI file and adds a line referencing the file TSIVID.386.

To do this, follow these steps:

1) Quit Windows.

2) Copy the file SYSTEM.INI from the directory where the Newton Connection for Windows was installed to your Windows directory. The default path is C:\NEWTON. The installer placed the old SYSTEM.INI file in this directory.

3) Launch Windows

4) Go to the Program Manager, select RUN from the FILE menu, and enter SYSEDIT.EXE. Click on OK.

5) Select SYSTEM.INI from the WINDOW menu.

6) Scroll down through the file until you see a line that says [386Enh].

7) Continue scrolling down through the file until you see a line that says [Standard].

8) Insert a new line above the line that says [Standard] and enter the following text on the new line in all caps:

   DEVICE=path\TSIVID.386

   where "path" is the DOS directory pointing to the installed Newton files.

   For example, if the files where installed in the directory C:\NEWTON, this statement would be:

   DEVICE=C:\NEWTON\TSIVID.386

9) Relaunch Windows.

Your Newton Connection Kit and fax/communications software should now work.

Power Macintosh 6100, 7100, 8100: Comparisons (8/96)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 1 August 1996

TOPIC ----------

How do the Power Macintosh 6100, 7100, and 8100 series computers compare with each other?

DISCUSSION ----------

The major differences between the Power Macintosh models are:

Begin_Table

Feature:	Power Macintosh 6100	Power Macintosh 7100	Power Macintosh 8100
Processor	PPC 601 @60 MHz PPC 601 @66 MHz	PPC 601 @66 MHz PPC 601 @80 MHz	PPC 601 @80 MHz PPC 601 @100 MHz
DRAM Expansion	8 MB to 72 MB	8 MB to 136 MB	8 MB to 264 MB
DRAM Slots	2 slots	4 slots	8 slots
DRAM Speed	80 ns	80 ns	80 ns
DRAM SIMM Sizes#	4,8,16 & 32 MB	4,8,16 & 32 MB	4,8,16 & 32 MB
DRAM SIMM Type	72-pin	72-pin	72-pin
Possible DRAM Configurations	8,16,24,40,72 MB	8,24,40,72,136 MB	8,40,72,136,264 MB
Ethernet	Standard	Standard	Standard
FPU	Standard	Standard	Standard

Standard VRAM	2 MB	2 MB	2 MB
VRAM Expansion	2 MB(no expansion)	2 MB(no expansion)	2 MB(no expansion)
VRAM Slots	no slot	no slot	no slot
VRAM Speed	80 ns	80 ns	80 ns
S-Video Input&	1	1	1
S-Video Output&	1	1	1
Monitor Ports	2	2	2
NuBus 90 Slots@	1!	3	3
601 PDS@	This slot is used by the Apple AV Technologies Card		
L2 Cache Slot	1	1	1

End_Table

The Power Macintosh 8100/110 is identical to the Power Macintosh 8100/80 excepting that it comes with 16MB of RAM, 2 MB of VRAM (expanable to 4 MB), and is equipped with a 110 MHz version of the PowerPC 601 microprocessor. There is no AV model.

Notes:

Composite SIMMs are not supported, SIMMs must be installed in pairs of the same size in adjoining SIMM slots.

! Requires a Power Macintosh 6100 NuBus Adapter Card (Part #M2337LL/A) This card gives you the ability to plug in a 7-inch NuBus expansion card.

% The Power Macintosh 6100 has a single expansion slot which can be used as a 601 PDS or as a NuBus slot with the optional Power Macintosh 6100 NuBus Adapter Card installed.

& The S-Video Input and Output ports can be used as composite video ports when used with the bundled composite input and output adapter cables.

@ With the Power Macintosh 6100, the PDS/NuBus 90 Slot is used by the Apple AV Technologies Card, which provides an additional monitor port and two s-video ports.

Power Macintosh Series: Standard versus AV Models (1/95)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 09 January 1995

TOPIC ----------

I need a short summary of the key differences between standard Power Macintosh models and Power Macintosh AV models.

DISCUSSION ----------

The primary difference is an additional expansion card, the Apple AV Technologies Card, which plugs into the 601 PDS (Processor Direct Slot) The Apple AV Technologies Card adds the following functionality to a standard Power Macintosh model, making it a Power Macintosh AV model:

Interfaces

- One video output port (S-Video) for output to video devices or a television (composite input and output adapter cables provided.)
- One video input port (composite and S-Video) for video devices.

Video RAM (VRAM)

- 2 MB of VRAM is included with Power Macintosh AV models and cannot be upgraded.

For further information on individual Power Macintosh AV model specifications, use the product name as a search string.

HyperCard 2.1: 16K Limits on Read Command (11/92)

Revised: 4/6/94
Security: Everyone

HyperCard 2.1: 16K Limits on Read Command (11/92)

==========

Article Created: 27 September 1991
Article Reviewed/Updated: 6 April 1994

TOPIC ----------

The documentation for HyperCard 2.1 (both paper and stack) state that the 16K (16384 characters) limit has been dropped for the 'read' command. This turns out to be only partly true. (Note: This limit is mentioned in the Script Language Guide for HyperCard 2.0.)

DISCUSSION ----------

The form

```
read from file <fileName> for <N>
```

will read > 16K if N is greater than 16384 and the file is more than 16K in size. (It will read the minimum of the file size and N chars, provided there is memory to do so.)

The form

```
read from file <fileName> until { end | eof }
```

will read until the end of the file -- which can be > 16K characters (provided there is memory).

The form

```
read from file <fileName> until <char>
```

will still only read a maximum of 16K characters from a file.

HyperCard 2.1: Color Options (6/93)

Revised: 5/9/94
Security: Everyone

HyperCard 2.1: Color Options (6/93)

==========

Article Created: 17 June 1992
Article Reviewed/Updated:11 June 1993

TOPIC ----------

HyperCard versions prior to and including 2.1 do not support color directly in card or background graphics. However, there are several options available to allow the use of color in HyperCard stacks. Note: Except for the first of these, they are not supported by Apple.

This article does not apply to HyperCard versions after 2.1.

DISCUSSION ----------

- Picture XCMD displays color or gray-scale pictures in several types of standard Macintosh windows. This XCMD comes free with HyperCard, and is documented in the Power Tools stack, which is included with both the HyperCard upgrade and the Development Kit.

- Colorizing HyperCard, from BungDabba Productions, is a set of XCMDs to color HyperCard. These XCMDs require at least 2MB RAM dedicated to HyperCard (4MB or more is preferable). This public domain unsupported product is available from most on-line systems.

- QuickColor is another product from BungDabba and is a "graphical" front-end for the ColorizeHC XCMD. It allows you to color your HyperCard stacks with pictures, colors, or both, with no programming or scripting.

- HyperTint: A demo of this commercial package for adding color to HyperCard is available on most on-line systems.

- Pictoid Package 1.0.2 is a package of XCMDs to display monochrome, color, and QuickTime movies in "pictoids". A "pictoid" is an any-shape windoid (it can contain holes and non-contiguous areas) which displays a picture. Pictoids can have scripts and behave like buttons.

HyperCard 2.1: Fix for Address Stack Import Problem (8/92)

Revised: 4/7/94
Security: Everyone

HyperCard 2.1: Fix for Address Stack Import Problem (8/92)

==========

Article Created: 26 May 1992
Article Reviewed/Updated: 26 August 1992

TOPIC ----------

If the ZIP Code in an old HyperCard 1.x.x Address stack contains arithmetic characters (+ - /) or letters (such as in Canadian postal codes), you may encounter an "Expected Number" error when attempting to import the data into the 2.1 Addresses stack. The script for this stack was changed from the 2.0 version to solve a similar problem but, this particular problem still exists.

DISCUSSION ----------

To correct the problem in the 2.1 version of the Addresses stack, follow the procedure outlined below. This procedure does not work in the 2.0 version of this stack.

1) Open the Addresses stack with the UserLevel set to 5.

2) Choose Bkgnd Info from the Objects menu.

3) The name of the background should be Body. Click on the Script button.

4) Choose Find from the Script menu and type the word "lastWord". Click Find.

5) You should be brought to the section of code listed below. The second line here contains an error.

```
if lastWord ≠ empty then
  if offset(lastWord, "/-+") = 0 then
    if value(lastWord) is a number then
      put lastWord into theZip
      delete last word of lastLine
    end if
```

```
        end if
      end if
```

6) "Comment out" the second line by inserting two hyphens (--) in front of it and add a new line directly underneath this line, as follows:

```
      if lastWord ≠ empty then
        --if offset(lastWord, "/-+") = 0 then
        if offset("-", lastWord) = 0 and offset("/", lastWord) = 0 and¬
        offset("+", lastWord) = 0 then
          if value(lastWord) is a number then
            put lastWord into theZip
            delete last word of lastLine
          end if
        end if
      end if
```

HyperCard 2.1: String Too Long Error (10/92)

==========

Article Created: 28 June 1991
Article Reviewed/Updated: 30 October 1992

TOPIC ----------

The "String Too Long" message may appear in the Apple Event Primer Stack that shipped with HyperCard 2.1. This article tells how to resolve the problem.

DISCUSSION ----------

1) Be sure you're running HyperCard 2.1 at UserLevel 5 and System 7.0 or greater.

2) Open stack Apple Event Primer.

3) When the "String too long" error appears, click the Script button.

4) The insertion point will be in front of the word "answer" of the errMessage handler (shown below).

```
  on errMessage theOffender
    if theOffender is not empty then answer¬
    "This stack uses features available only in HyperCard" && ¬
    "2.1 or greater running with System Software version 7 or" && ¬
    "greater. To take advantage of these features, you will need to" &&¬
    "upgrade your" && theOffender & ". For now, you will only be" &&¬
    "able read about these features." --Δ
    exit to HyperCard
  end if
end errMessage
```

5) Shorten the handler by deleting the characters

```
   & ". For now, you will only be" && "able read about these features." --Δ
```

from the sixth and seventh lines of the handler.

6) Close the script editor and save your changes.

HyperCard 2.1: "Send Message" Error (10/92)

==========

Article Created: 15 July 1991
Article Reviewed/Updated: 30 October 1992

TOPIC ----------

The "Send Message..." error message may appear in the Apple Event Primer Stack that ships with HyperCard 2.1.

DISCUSSION ----------

To resolve the problem:

1) Be sure you're at userLevel 5, is running HyperCard 2.1, and System 7.0 or later.

2) Open stack Apple Event Primer.

3) Go to card "Conversing" by clicking the "Chat" button on the first card.

4) Edit the script of card button "Send Message..." by clicking the "Send Message..." card button while holding the Option and Command keys down.

5) Locate line 20 (empty lines count, too) of the mouseUp handler (bold down below but not in the stack).

6) Replace "Apple event Primer" in line 20 with "Gossip", so that the line now reads "send "Gossip" && quote & theNews &¬".

HyperCard 2.0v2: Problem with Appointments Stack (7/92)

Revised: 4/7/94
Security: Everyone

HyperCard 2.0v2: Problem with Appointments Stack (7/92)

==========

Article Created: 6 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --

In HyperCard 2.0v2, if you are in the appointments stack and are on January 31, clicking the button "Month" brings you to March 3rd, when most people would expect it to go to February 28th.

DISCUSSION --

The Appointments stack makes the assumption that the number of days in a month will always be 30 or 31. Therefore, if the month of January has 31 days, and the month of February has 28 days, and the current day is January 31, then the length of the next month is less than the number of the current day (28<31). Because of this, HyperCard 2.0 seems to overshoot the last day of the next month by the difference of the two numbers (31-28=3). Therefore, when you click the month button, instead of going from the last day of January to the last day of February, you end up at March 3.

This was corrected in HyperCard version 2.1.

HyperCard 2.0: Problem with Appointments Stack (7/92)

Revised: 4/7/94
Security: Everyone

HyperCard 2.0: Problem with Appointments Stack (7/92)

==========

Article Created: 24 April 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

This article describes a problem with the Appointments stack that was shipped with HyperCard 2.0. It is fixed in HyperCard 2.1.

DISCUSSION ----------

If you try to return to a day that has been previously deleted, and allow the stack to try to create the cards to get to that day, then the stack will go into a loop, and create new cards for as long as you have hard disk space. Moreover, since the cantAbort property is set by the script to true, Command-period does not interrupt it.

Note that some customers received version 2.1 of the application but have the 2.0 version of the stack. Check the stack script to find the version of the stack.

HyperCard: Books on HyperCard and XCMDs (8/93)

==========

Article Created: 7 February 1991
Article Reviewed/Updated: 2 August 1993

TOPIC ----------

This article list some books on HyperCard XCMD development.

DISCUSSION ----------

The following books were published before the release of HyperCard version 2.0v2 :

- XCMDs For HyperCard by Gary Bond. Published by MIS Press.
- HyperCard Developers Guide by Danny Goodman. Published by Bantam Books.

Since XCMD development can also include the use of the Mac Toolbox, you may also want to consult:

- Inside Macintosh Volume I-V. Published by Addison-Wesley
- Macintosh Revealed Volume 1-4 by Stephen Chernicoff. Published by Hayden Books.

- The Complete HyperCard 2.0 Handbook, by Danny Goodman. Published by Bantam Computer Books. 1990.

- HyperTalk 2.2 The Book 2nd Edition, by Dan Winkler, Scot Kamins and Jeanne Devoto. Published by Random House, 1994.

- The Complete Book of HyperTalk 2, by Dan Shafer. Published by Addison Wesley. It highlights only the features of version 2.0, with some reference to earlier versions where necessary.

- “Windoid”, newsletter from AHUG, published by AHUG (Apple HyperCard Users Group).

- “HyperPub”, a new quarterly journal of hypermedia written by Michael Swaine, published by The Prose Lab, 31 Patrick Road, Santa Cruz, CA 95060; (408) 459-8564.

- “Inside HyperCard”, a new monthly journal for HyperCard developers published by The Cobb Group, P.O. Box 36160, Louisville, KY 40232-9719

- The Complete HyperTalk 2.0, by Dan Winkler and Scott Kamins. Published by Bantam Computer Books. 1990.

- Cooking With HyperTalk 2.0, by Dan Winkler and Scott Knaster. Published by Bantam Computer Books. 1990.

- HyperTalk 2.0 New Features, by Ted Jones. Published by BMUG Press, 1442A Walnut Street, #62, Berkeley, CA 97409-1496. 1991.

HyperCard 2.1: Cowhide Effect & Power Tools Stack (8/94)

Revised: 8/23/94
Security: Everyone

HyperCard 2.1: Cowhide Effect & Power Tools Stack (8/94)

==========

Article Created: 26 September 1991
Article Reviewed/Updated: 23 August 1994

TOPIC ----------

If version 2.1 of the Power Tools stack is in use, then the Cowhide effect in the Background Art stack does not work.

DISCUSSION ----------

The problem appears to be in the "Lighten" paint effect -- when you call it by script or choose it from the Paint menu (the power key seems to be unaffected...) -- in combination with the "doMenu" handler in the Power Tools stack.

This problem also effects several of the demo scripts in the HyperTalk Reference Stack (those that call doMenu "Revert"). Most of these demos involve painting tools/ paint properties and failure to revert leaves paint on the card.

The following will fail with the Power Tools stack in use: Create a card that's filled with black paint -- and execute the following from a handler

```
choose select tool
doMenu "Select All"        -- or make any non-empty selection
doMenu "Lighten"           -- this works!
doMenu "Lighten"           -- nothing happens
```

Any other affected commands will fail if added to the end of this script. The selection seems to be getting lost after the first command.

Workarounds for other scripters (none is very effective):
• Make sure Power Tools is not in use.
• Re-select an area before calling subsequent commands in the Paint menu.

HyperCard 2.0, 2.1: Create Report with Breaks (11/92)

Revised: 4/12/94
Security: Everyone

HyperCard 2.0, 2.1: Create Report with Breaks (11/92)

==========

Article Created: 19 November 1991
Article Reviewed/Updated: 10 April 1994

TOPIC

HyperCard 2.0 and 2.1 can't print dynamically sized records that do not break across columns or pages when printing reports. HyperCard 1.2.x can.

DISCUSSION

A Workaround

There is a workaround involving a series of scripts (below) that will solve this problem. To use the script, you need to

1) From the File menu, choose "Print Report...".

2) From the Edit menu, choose "New Report".

3) Set the top and bottom margins of the report to one-half inch.

4) Set the space between records to 0 inches.

5) From the Edit menu, choose "Report Items...".

6) From the Items menu, choose "New Item"..

7) Resize this item to the full height of the record by clicking and dragging in its corner.

8) From the Items menu, choose "Item Info...".

9) In the Item box, type "specialReport()"

10) Click OK as many times as you need to to exit and save your changes.

11) Enter the handlers (below) into the stack or background script.

How It Works

These scripts work by making the assumption that the default 12-point line height has been specified for the items in the report -- if this is not true, the script will need to be adjusted accordingly. A doMenu handler is required as well, so if you already have one, you can simply add the lines from the one below that are different from the one you already have to your current doMenu handler.

Finally, the report itself must have half-inch top and bottom margins, and no space between the labels, and must have fields corresponding to those in the Address stack shipped with HyperCard 2.1. Where differences occur, the script will have to be modified.

The Handlers

```
on doMenu item
  global lineCount -- For our special report
  if item = "Print Report..." then put empty into lineCount
  pass doMenu
end doMenu

function writeBLine number
  if number is empty then put 1 into number
  repeat number
    put return & " " after theLine --  option-space here
  end repeat
  return theLine
end writeBLine

function specialReport
  -- Assumptions:
  --   a 12 point line height.
  --   a half-inch top and bottom margin.
  --   an 11-inch high page.
  -- Other handlers needed:
  --   on domenu (to reinitialize lineCount each time it's called)
  --   function writeBLine (to write a line with only an option-space in it
  --     because HyperCard's report generator removes trailing returns.
  --
  global lineCount
  put 12 into lineHeight
  --
  if lineCount > 63 or lineCount is empty then put 0 into lineCount
  --
  if bg fld "Company" is empty
  then
    put bg fld "Name" & return & bg fld "Street" & ¬

HyperCard: Fax STF & Dial Command Problems (4/93)

==========

Article Created: 3 March 1993
Article Reviewed/Updated: 10 April 1994

TOPIC ----------

I am using Fax STF 2.x software, which holds the serial port open until another application tries to open it, at which point it releases the port. When it see that the port is available again it will take control again. This works fine with several different terminal programs, but when I use the "dial" command and try to fax something at a later point the fax software complains that the port is in use by another application. Does HyperCard close the serial port after it uses it? Is there a way to get it to release the port?

DISCUSSION ----------

Using the dial command causes the Fax STF 2.x software to think that the serial port is in use. The Macintosh must be restarted before the Fax STF software will be able to fax. The problem is caused by a problem in the FaxSTF 2.x software and is fixed in FaxSTF version 3.0, which was released in December 1993.

HyperCard: Fixing New Card Problem in Graph Maker Stack (7/92)

Revised: 4/11/94
Security: Everyone

HyperCard: Fixing New Card Problem in Graph Maker Stack (7/92)

==========

Article Created: 27 February 1992
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

If I make a new card in the Graph Maker stack, it becomes non-functional, with a string of "Can't understand" messages and so forth. What could be the cause?

DISCUSSION ----------

The reason is that the background is trapping the openCard message, and a handler is sending a message to the CARD script, which is not there for new cards.

The easy workaround is simply to disable the New Card command for this stack, since there should be no reason to make new cards in this stack.

HyperCard 2.0v2 Graph Maker: Fix for Business Chart Error (7/92)

Revised: 4/11/94
Security: Everyone

HyperCard 2.0v2 Graph Maker: Fix for Business Chart Error (7/92)

==========

Article Created: 16 March 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --

In HyperCard 2.0v2, the Fever charting section of the Graph Maker stack contains an oversight. A chart that contains values greater than 1, and contains no value greater than 2, goes careening wildly off the chart.

DISCUSSION --

The fix is simple: in the background script there is a function called getMaxValue. Change it to add 1 to the value returned as the highest value being charted.

```
function getMaxValue dataList
  -- returns the number with the highest value
  sort dataList descending numeric
  return line 1 of dataList + 1
end getMaxValue
```

This has been fixed in HyperCard 2.1

HyperCard Pre 2.0v2: Problem with HP DeskWriter (7/92)

==========

Article Created: 12 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

This article describes a problem printing from early versions of HyperCard to a DeskWriter printer.

DISCUSSION --------------------

When printing to the Hewlett-Packard DeskWriter, you only get the first page of a short print job and page one and some other arbitrary pages of a long print job. The rest of the pages are blank.

This has been fixed in HyperCard 2.0v2 and later.

HyperCard: Importing Addresses Using Import Text... (7/92)

Revised: 5/6/94
Security: Everyone

HyperCard: Importing Addresses Using "Import Text..." (7/92)

==========

Article Created: 11 February 1992
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

The Address Stack's Import script, designed to allow easy import of one address stack into another, fails when the last word of the address stack is text containing a mathematical operator (+,-,/,*).

DISCUSSION ----------

The import option ("Import Text..." under the "Utilities" menu of the Address Stack) was initially designed to handle addresses in the following format:

```
Name
Company
Street
City, State Zip
```

In order to handle international addresses ending in country names, or any other non-standard address ending in text, a line of script was inserted to evaluate whether the last word in the field was text or a number:

```
If Value(lastword) is a number then
```

This function works if the last word of the address field is all text, all number, or a valid mathematical expression, such as a ZIP-plus-four (96453-2345 for example). However, when a non-standard entry such as "USA+CANADA" is the last word in the field, the HyperCard VALUE function fails because it tries to evaluate the expression mathematically.

To fix the problem, run the import script. If HyperCard is set to userlevel 5, a dialog box with the choice of DEBUG, SCRIPT or CANCEL will appear if the script fails. Choose SCRIPT.

To fix the script for operation under HyperCard 2.1 replace the following

line:

```
          if offset(lastWord, "/-+") = 0 then
```

with the line:

```
 if offset("/",lastWord) = 0 and offset("+",lastWord) = 0 and
 offset("*",lastWord) = 0 then
```

This fix should allow the import script to proceed to completion, though it will not place ZIP codes containing the +4 numbers into the ZIP code field.

The following line is intended to evaluate whether the last word of the address field is or is not a number :

```
            if value(lastword) is not a number then
```

HyperCard:Importing Addresses 2.0 to Addresses 2.1 (7/92)

Revised: 5/6/94
Security: Everyone

HyperCard:Importing Addresses 2.0 to Addresses 2.1 (7/92)

==========

Article Created: 26 September 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

The HyperCard 2.1 Address stack can't import data from the 2.0 Address stack.

DISCUSSION --------------------

The reason is that the returns in the 2.0 Notes field are never parsed out and replaced with the "..." (ellipses, made with Option-semicolon keys) that the import script is looking for.

So in the ImportTextFromNewStack handler, in the background of the 2.1 Addresses stack, one line should be added:

```
  put bg fld "Notes" into theNotes -- notes field
  put SubstituteChar(return,"…", theNotes) into theNotes -- this is the new line
  write theName & tab & theCompany & tab & theStreet & tab &...
```

This will solve the problem.

HyperCard 1.2.5: Error Converting Month Calendar (11/92)

Revised: 5/6/94
Security: Everyone

HyperCard 1.2.5: Error Converting Month Calendar (11/92)

==========

Article Created: 24 September 1992
Article Reviewed/Updated: 25 November 1992

TOPIC ----------

Converting the Month Calendar from the HyperCard 1.2.5 Idea Stack to HyperCard 2.x results in a script error when the Extend button is clicked.

DISCUSSION ----------

The error, "Invalid Date" (or the error "Destination does not contain a number") occurs because the old script creates a long date in which the day name does not match the day number. Such as:

```
Sunday, September  12, 1992
(The correct day name for this date is Saturday)
```

While HyperCard 1.x could correctly convert such a mismatched long date to another date format (it ignores the day name), HyperCard 2.x will see the date as invalid, and exit the script with an error.

To correct the problem:

1) Go to the background script of the calendar stack, and find the function startOfMonth.

2) Find the first line reading "Convert it to long date", and change the words "long date" to "dateItems". (Note: dateitems is one word.)

3) Change the next line

```
  put 1 into word 2 of item 2 of it
```

to

```
  put 1 into item 3 of it
```

Note: The dateItems format shows the date "Saturday, September 12, 1992" as "1992,9,12,0,0,0,7"

(The parameters are "year,month,day,hours,minutes,seconds,day of week")

HyperCard 2.x and More Disk Space INIT (8/92)

Revised: 5/6/94
Security: Everyone

HyperCard 2.x and "More Disk Space" INIT (8/92)

==========

Article Created: 26 May 1992
Article Reviewed/Updated: 26 August 1992

TOPIC ----------

There appears to be a problem with HyperCard 2.x and Altsys Corp's "More Disk Space" INIT. This INIT performs resource compression using Apple's built-in resource compressor.

If HyperCard has at any time been compressed by this utility, it will not allow you to display large cards, regardless of the amount of memory allocated to the application. The cards will always appear smaller with the scroll window displayed.

DISCUSSION ----------

The fix is to re-install HyperCard from the original disks. Decompressing the application does not correct the problem.

HyperCard 2.0: MultiFinder and Hidden Windows (7/92)

Revised: 5/6/94
Security: Everyone

HyperCard 2.0: MultiFinder and Hidden Windows (7/92)

==========

Article Created: 21 February 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

HyperCard 1.2.x was set up to automatically hide the current stack when you switched out of HyperCard to another application (or the Finder) using MultiFinder. HyperCard 2.0 no longer does this. This can be distressing, especially to those with small screens and full-size stacks. The difficulty can be worse if there are multiple stacks open at once (multiple windows). Also, although some windows ARE automatically hidden by HyperCard 2.0, the Variable Watcher and Message Watcher are not (there may be others…)

The following bit of HyperTalk remedies this situation.

DISCUSSION --------------------

When placed in the Home Stack Script (it needs to always be in the inheritance path) somewhere in an "on idle" handler, it will automatically detect the fact that HyperCard is not the current application and hide all the visible windows. When you return to HyperCard, all the windows will reappear.

Be sure to add the container (variable) named resumeStackList to the global list at the beginning of the "on idle" handler.

```
on idle
  global resumeStackList

            .
            .
            .

  if the suspended then
    if resumeStackList is empty then
      put the windows into rSL
      repeat with z=1 to the number of lines in rSL
```

```
        if the visible of window (line z of rSL) then
          put line z of rSL & return after resumeStackList
          hide window (line z of rSL)
        end if
      end repeat
    end if
  else
    if resumeStackList is not empty then
      repeat with z=1 to the number of lines in resumeStackList
        show window (line z of resumeStackList)
      end repeat
      put empty into resumeStackList
    end if
  end if
  pass idle
end idle
```

HyperCard 2.0, MultiFinder, and Open With (7/92)

Revised: 5/9/94
Security: Everyone

HyperCard 2.0, MultiFinder, and Open With (7/92)

==========

Article Created: 6 March 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

If you try to open a document with an application from within HyperCard 2.0 or 2.0v2 and you are using MultiFinder, it will only work correctly if the application you are trying to use to open the document has not yet been opened (that is, it doesn't appear in the Application menu).

DISCUSSION --------------------

If the application has already been opened, your Macintosh will switch to that application, but it will not open the specified file. For example:

open "Hard Disk:Text:test file" with "MacWrite II 1.1v1"

This will work correctly only if MacWrite is not currently open.

HyperCard 2.0v2: Never heard of... Error (7/92)

Revised: 5/6/94
Security: Everyone

HyperCard 2.0v2: "Never heard of..." Error (7/92)

==========

Article Created: 27 March 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Whenever I open HyperCard 2.0v2, I get the message "Never heard of bkgnd field 'Paths.'" I can re-install HyperCard to get rid of this message, but it eventually crops up again with some use.

DISCUSSION ----------

HyperCard 2.0v2 stores the pathnames of your frequently used stacks, documents, and applications in a series of cards in the Home stack. When HyperCard starts up, it looks at these cards first, referencing them by name. Essentially, it says, "Give me the information from the Path field on the Applications card." HyperCard also lets you set up a series of "Custom" Home cards with any name you specify.

Because of this, if you were to use the "Rename this card" command in the Home menu to call another card "Applications," HyperCard would mistakenly look for the Paths field on your "Applications" card. It won't find it there, and that is why you get the error message. Thus, you will get this error if any of the custom cards in your Home stack is named "Documents," "Applications," or "Stacks."

The easiest way to work around this is to click on your custom cards and rename them to something like "My Stacks," "My Applications" or "My Documents."

HyperCard: Opening MacDraw 1.9.x Files (10/92)

Revised: 5/6/94
Security: Everyone

HyperCard: Opening MacDraw 1.9.x Files (10/92)

==========

Article Created: 15 May 1992
Article Reviewed/Updated: 30 October 1992

TOPIC ----------

Using HyperCard to open MacDraw 1.9.x documents in MacDraw Pro 1.0v1 does not work. (This is fixed in MacDraw Pro 1.5.)

DISCUSSION ----------

This command should launch MacDraw Pro and open a MacDraw 1.9.x file named MDdoc:

  Open MDdoc with MacDraw Pro

Instead, it opens a blank, untitled document.

This command works correctly for all other openable file types. For example:

  Open MW2doc with MacDrawPro

opens a file named MW2doc into MacDraw Pro, even if this file is an EPSF, TIFF, PICT, MacWrite II or any other openable file.

HyperCard 2.0v2: PostScript Files from HyperCard (7/92)

Revised: 5/6/94
Security: Everyone

HyperCard 2.0v2: PostScript Files from HyperCard (7/92)

==========

Article Created: 4 March 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Bliss Interactive Technologies has been able to successfully create PostScript files from HyperCard 2.0v2 under System 6.0.7 in MultiFinder and System 7.0. The procedures are outlined below.

DISCUSSION ----------

HyperCard 2.0v2 and System 6.0.7 with and without MultiFinder
---

1) Choose a PostScript LaserWriter from the Chooser.

2) Select Page Setup... from the File menu and click OK.

3) To generate a PostScript file without the LaserPrep header, choose Print Field..., Print Stack..., or Print Report... from the File menu.

4) If you choose Print Field..., immediately after you click OK in the next dialog, type and hold down Command-F until the Creating PostScript message appears. To create a file with the LaserPrep header type Command-K instead of -F.

5) When choosing Print Stack... or Print Report..., another dialog will appear with a Print... button. Immediately after clicking Print..., type Command-F to create a PostScript file without the LaserPrep header. Type Command-K instead of -F to capture the LaserPrep header.

6) For Print Card..., immediately after selecting this menu item, type Command-F to create a PostScript file without the LaserPrep header. Type Command-K instead of -F to capture the LaserPrep header.

NOTE: The files generated are saved as text files and titled PostScript0, PostScript1 to 9 -- similar to how screen dumps are named.

HyperCard 2.0v2 and System 7.0

---

1) Choose a PostScript LaserWriter from the Chooser.

2) Turn Background printing OFF.

3) Select Page Setup... from the File menu and click OK.

4) Choose Print Field..., Print Stack..., or Print Report... from the File menu. After clicking OK in the Field dialog, or Print... in the Stack and Report dialog, the typical Print dialog will appear. At the bottom of this dialog, you'll see two radio buttons for the destination. Toggle on PostScript and the Print button is renamed Save. Click on Save and the save dial appears, allowing you to name the file and its location. The PostScript file created contains the LaserPrep header.

5) If you want to capture a single card, you cannot create a PostScript file using the Print Card menu item. Instead, mark the card and choose Print Stack... In the next dialog click on Marked cards and proceed as above.

NOTE: The files generated are saved as text files.

HyperCard 2.0v2: Print Stack Does Not Print Tall Adjusted (7/92)

Revised: 5/6/94
Security: Everyone

HyperCard 2.0v2: Print Stack Does Not Print Tall Adjusted (7/92)

==========

Article Created: 22 October 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

HyperCard 2.0v2 had a problem printing cards and stacks because the Tall Adjusted checkbox was disabled causing card images to print too narrow.

In version 2.1, the Tall Adjusted checkbox has been enabled, but it only affects Print Card, not Print Stack.

DISCUSSION ----------

Solutions:
- Print stacks in landscape mode.
- Create a button with a script to repeat for the number of cards, doMenu "print card", and go next card.

This article is adapted from the Claris Tech Info database.

HyperCard: Problem with Readymade Buttons Stack (7/92)

Revised: 6/22/94
Security: Everyone

HyperCard: Problem with Readymade Buttons Stack (7/92)

==========

Article Created: 6 February 1991
Article Reviewed/Updated: 22 Jun 1994

TOPIC --

In the Readymade Buttons stack is a card called "Create Card Pictures". A field on the button explains that the buttons will disappear momentarily while the card is being copied. However, if you are at userlevel 1 or 2 and click the button, an error message says that it doesn't recognize Copy Card. After clicking "OK" the buttons are gone.

DISCUSSION --

As an immediate fix, type in show card button 1 or 2 (depending which one disappeared). As a permanent fix, the script needs to be changed. The following is a proposal.

```
on mouseUp
  if the userlevel >= 3 then
    hide me
    doMenu "Copy Card"
    show me
  else
    exit mouseup
  end if
  answer "Go to the card where you wish to paste the miniature card"¬
  && "image and press Command-Shift-V." with "OK"
end mouseUp
```

HyperCard 2.x: If Reference Stack Can't Understand (4/95)

Revised: 4/21/95
Security: Everyone

HyperCard 2.x: If Reference Stack Can't Understand (4/95)

==========

Article Created: 14 July 1992
Article Reviewed/Updated: 21 April 1995

TOPIC ----------

When you try to use the Reference Stack in HyperCard 2.x, nearly every mouse click may result in error messages containing "Can't understand..." . The problem is that the HyperCard Help Stack, which contains many handlers in its stack script required by the Reference stack, has not been placed "in use".

DISCUSSION ----------

The cause of the problem is a subtle scripting oversight in the HyperCard Reference stack's Openstack handler. When the Reference stack first opens it looks to see if the HyperCard Help Stack is already "in use". It does this by looking for the existence of the string "HyperCard Help" in the stacksInUse.

Unfortunately, if the Audio Help stack is placed "in use" first, and it happens to reside in a folder labeled "HyperCard Help", its full path name, including the folder name "HyperCard Help", shows up in the stacksInUse. The Reference stack sees "HyperCard Help" in the stacksInUse, and assumes that the HyperCard Help stack is already "in use".

To avoid the problem:
- Change the name of the HyperCard Help folder (for example, "HC Help")
  or
- Move the Audio Help Stack out of the HyperCard Help folder

HyperCard 2.1: Don't Specify Root File Name as :: (8/92)

Revised: 5/6/94
Security: Everyone

HyperCard 2.1: Don't Specify Root File Name as :: (8/92)

==========

Article Created: 22 June 1992
Article Reviewed/Updated: 26 August 1992

TOPIC ----------

In HyperCard 2.0, I use double colons (::) to specify the root directory without knowing the name of the hard disk (so the script is not hardcoded with the name of my disk). But now, when I run HyperCard 2.1, every time I open a file inside a subdirectory using a command such as:

```
open file ":: tmp dir:tst.txt"
```

It closes the file immediately after opening it. So when I try to write to it with the command:

```
write "test" to file ":: tmp dir:tst.txt"
```

HyperCard complains that the file is not open. The same script runs fine on a Macintosh Plus with HyperCard 2.0.

DISCUSSION ----------

A bug in HyperCard 2.1 keeps the subdirectory specification "::" from working as it did in HyperCard 2.0. This will be fixed in a future release of HyperCard.

HyperCard 2.0: Sliding Objects in HyperCard Reports (7/92)

Revised: 5/6/94
Security: Everyone

HyperCard 2.0: Sliding Objects in HyperCard Reports (7/92)

==========

Article Created: 7 March 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

While HyperCard 2.0 doesn't have any native ability to slide report items up or left if one is blank while printing reports, it is possible to get that accomplished.

DISCUSSION ----------

The trick is to use a single report item, instead of one for each field. Then, by double-clicking on the report item, you can set the contents of the item to a call to a function. The function can be in your stack or background scripts, and can process the information on the card.

For example:

Assume the following fields: Name, Company, Address1, Address2, City, State, and Zip. Now assume that Company and Address2 will sometimes be empty, and that they should slide.

For the contents of your one report item in your label template, simply enter the name of a function: makeLabel()

Now, in your stack script write something like the following handler:

```
function makeLabel
  put bg field "Name" into theLabel
  if bg field "Company" is not empty
  then put return & bg field "Company" after theLabel
  put return & bg field "Address1" after theLabel
  if bg field "Address2" is not empty
  then put return & bg field "Address2" after theLabel
  put return & bg field "City" & ", "& bg field "State" & " " & bg field "Zip"
after theLabel
```

```
  return theLabel
end makeLabel
```

For each card that's printed in the report, the single report item will be evaluated according to the function above, and will print the formatted label.

HyperCard 1.x: Converting Stack Ideas to 2.x (7/92)

Revised: 5/9/94
Security: Everyone

HyperCard 1.x: Converting Stack Ideas to 2.x (7/92)

==========

Article Created: 30 March 1992
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

Version 1.x of HyperCard included a stack named "Stack Ideas" that contained several templates to be used in creating new stacks. Two of these templates, "Monthly Cal" and "Weekly Cal 3", had problems after being converted to 2.x.

DISCUSSION ----------

- With the "Weekly Cal 3" stack the date fields were not large enough to hold the full date. Therefore, the 14th of March would show as 1. This is caused by changes in the HyperCard text engine, where non-proportionally spaced fonts need a bit more room to be displayed. Enlarging the individual fields solves the problem.

- The problems with "Monthly Cal" are a bit more complex. Problems occurred as a result of some scripting errors encountered when using the "Extend" button.

HyperCard: Starting QuickTime Tools Stack (7/92)

Revised: 5/9/94
Security: Everyone

HyperCard: Starting QuickTime Tools Stack (7/92)

==========

Article Created: 30 March 1992
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

The HyperCard Development Kit and HyperCard Upgrade each have an additional button installed on the Home Stack to access the QuickTime Tools Stack. However, you may find that clicking this button doesn't take you to the QuickTime Tools stack.

DISCUSSION --------------------

This happens when the compressed QuickTime Tools Stack that ships with HyperCard has not been decompressed. If you do not decompress the stack before trying to access it, the Home Stack doesn't recognize the file as a HyperCard stack.

To correct this problem, simply double click on the compressed file to decompress it. Then return to the Home Stack where the QuickTime Tools button should now be working.

HyperCard 2.0 and Stop Sign Icon (7/92)

Revised: 5/9/94
Security: Everyone

HyperCard 2.0 and "Stop Sign" Icon (7/92)

==========

Article Created: 25 September 1990
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

When assigning an icon to a button in HyperCard 2.0, a window will appear showing all icons available for use in your current stack. Near the lower left hand corner of this scrollable window is an icon called "Stop" which looks identical to the "Stop" icon on the Find File dialog box. Normally, in HyperCard, assigning a icon to a button is just a matter of double-clicking on it. However, when you click on the "Stop" icon, nothing happens.

DISCUSSION ----------

This is because Apple decided to use some of the same icons found in the System and Finder files, and include them in HyperCard. This helps developers make screen prototype mock-ups quickly. Rather than "re-invent the wheel," Apple simply moved copies of these System/Finder icons into HyperCard via a resource mover. Hence, the System/Finder ID numbers for these icons also got transferred as well into HyperCard.

Icon numbers 0-128 are reserved by the Macintosh operating system for System Use only. Therefore, when HyperCard goes to read the "Stop" icon, and it sees an ID # of 0 (zero), it doesn't know what to do with it. Thus the icon, although selected, never appears.

The workaround is to (from within the icon window) assign an icon number to the stop icon which is greater than 128. This will enable HyperCard to "see" the icon, and display it properly when you assign it to a button. Be sure that this new number is different than all other icons in this stack, otherwise another icon will be overwritten.

HyperCard 2.x and StyleWriter: Print Card Problem & Fix (10/92)

Revised: 5/9/94
Security: Everyone

HyperCard 2.x and StyleWriter: Print Card Problem & Fix (10/92)

==========

Article Created: 15 November 1991
Article Reviewed/Updated: 19 October 1992

TOPIC ----------

Vertical lines do not align perfectly when printing to a StyleWriter from HyperCard 2.x using the "Print Card" option. This problems does not happen with horizontal lines or when using the "Print Stack" option.

DISCUSSION ----------

Yes, StyleWriter output has vertical-line registration problems when using the "Print Card" option in HyperCard 2.x. The registration problem is caused by the HyperCard printing code, not by the StyleWriter.

The registration problem can be avoided by using the "Mark Card" option:

1) Go to the card you want to print.

2) Display the "message box".

3) Type "Mark Card" into the message box and press either the Return or Enter key. Note that more than one card can be marked at a time.

4) Select "Print Stack" from the "File" menu.

5) Select the "Marked Cards" option.

6) Click the "Print" button.

7) Type "unMark Card" in the message box and press either the Return or Enter key. This unmarks the card so it doesn't printed the next time this procedure is used.

HyperCard 2.1: Phone Dialer and Teleport Modem (7/92)

Revised: 5/9/94
Security: Everyone

HyperCard 2.1: Phone Dialer and Teleport Modem (7/92)

==========

Article Created: 18 September 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

HyperCard 2.1 and the Teleport modem from Global Village do not always work together properly.

DISCUSSION ----------

When dialing the phone with HyperCard through the Teleport, the Teleport will not hang up, which draws voltage from the phone, resulting in a more distant, less clear connection. But when the mouse moves, or a key is hit (a signal sent down the ADB), then the Teleport hangs up.

The workaround is to use the dialingTime property that is new to HyperCard 2.1, and set that property to around 10 seconds. There are several ways to do that:

- If you are using the Phone Dialer stack that comes with HyperCard 2.1 to do your dialing, then simply go to the Dial Delay card, select where it says "5 seconds", and move the selector on the slider bar that will then appear.

- If you are dialing directly from your stack, then a simple script like the following will work:

```
set the dialingtime to 600
-- (these are ticks, and there are 60 ticks per second, so 600/60=10)
dial dialNumber with modem
```

The reason for this problem is a little complicated. The Teleport is a special kind of modem, that uses the ADB (keyboard and mouse connections) both to draw power and to communicate with the serial port. When communications messages are sent to the serial port, the Teleport driver intercepts them, sends them over the ADB to the Teleport, where the

Teleport software can process them. HyperCard closes down the serial connection so fast (normally 3 seconds after the Dial command has been given), that the Teleport software never gets a chance to do all it needs to, such as hanging up.

But the dialingTime property sets a specified amount of time that HyperCard 2.1 will hold the serial connection open, allowing the Teleport software a chance to complete its routines.

HyperCard 2.0v2 users will not have the same problem, since this version of HyperCard was hard-coded to hold the serial connection for a long period of time - around 10 seconds. This works for the Teleport, but introduces other problems.

HyperCard 2.0v1 will probably have the same problem as HyperCard 2.1, with the unfortunate difference that HyperCard 2.0v1 has no dialingTime property, and, therefore, may not have any way to work around the problem.

HyperCard 2.0: Unitialized Variables (7/92)

==========

Article Created: 30 July 1991
Article Reviewed/Updated: 23 July 1992

TOPIC --------------------

There is some inconsistency in how HyperCard 2.0 treats unitialized variables and the constant "empty".

DISCUSSION --------------------

For example, typing

```
the number of items of myVariable
```

into the message box returns "1" when myVariable has not been initialized.

However, initializing myVariable with

```
put empty into myVariable
```

and then typing

```
the number of items of myVariable
```

returns "0".

HyperCard 2.0v2: Problem With WindChooser 1.12 INIT (7/92)

==========

Article Created: 15 January 1991
Article Reviewed/Updated: 23 July 1992

TOPIC ----------

An INIT called WindChooser 1.12 (created 7/27/89) causes problems with HyperCard 2.0v2.

DISCUSSION ----------

Actually there are a series of WDEF-style INITs which cause a false (and invisible) window to get layered in front of HyperCard's window. Others of this type are Erics' WDEF, and Dave's WDEF (a color modification of Erics' WDEF).

The symptoms are a failure to redraw the screen after displaying dialogs, and an inability to operate with the mouse anywhere in a HyperCard window, including clicking.

Note: The WDEF referred to above is NOT related to the common virus of that name. The letters refer to a very common Macintosh resource for Window DEFinition.

MacTCP: When It Initializes (2/95)

Revised: 2/10/95
Security: Everyone

MacTCP: When It Initializes (2/95)

==========

Article Created: 28 January 1994
Article Reviewed/Updated: 10 February 1995

TOPIC ----------

My office has a network of several Macintosh computers which run TCP/IP.

I am unable to consistently use Ping to find out the IP address of a particular Macintosh. If I start up one Macintosh without loading any software, then "ping" it from a second Macintosh, I will not get a response from the first Macintosh.

If I start up a Macintosh and run a TCP/IP application, like Gopher or NewsWatcher, then "ping" it from a second Macintosh, I will get a response from the first Macintosh and can obtain the IP address.

Why does this happen?

DISCUSSION ----------

Traditionally, Apple's MacTCP driver was not initialized at startup. Instead, it loaded into memory and waited for the first MacTCP application to be launched before initializing. If you "ping" a Macintosh before it loads the MacTCP driver, you would not get a response.

MacTCP was designed so a user could change its parameters before launching a MacTCP application and not be required to reboot the Macintosh to use the new parameters.

With System 7.5, MacTCP does not initialize at startup as described above. Confusion might arise if the TCP/IP Connection for Macintosh product is installed which include SNMP agents. With SNMP present, the MacTCP driver is initialized at startup, and you can "ping" this Macintosh without other MacTCP applications being started.

Article Change History:
10 Feb 1995 - Added SNMP information and corrected System 7.5 information.

20 Dec 1994 - Noted that TCP is active at system start under System 7.5.

System 7: Can I Save to the Move&Rename Folder? (2/94)

Revised: 2/4/94
Security: Everyone

System 7: Can I Save to the "Move&Rename" Folder? (2/94)

==========

Article Created: 4 February 1994

TOPIC ----------

When using Personal File Sharing or AppleShare under System 7, I occasionally save files in the "Move&Rename" folder. Often, I cannot find these files when I go back to look for them.

1) What is the purpose of the "Move&Rename" folder?

2) When are the contents of this folder deleted?

3) When should I use the "Move&Rename" folder?

DISCUSSION ----------

1) The "Move&Rename" folder (which is marked invisible) is created by Personal File Sharing and AppleShare as a temporary holding point for files during the execution of AppleShare File Protocol (AFP) "Move and Rename" calls. The "Move and Rename" call, as the name suggests, is used to move a file between folders and give it a different name in the destination folder. HFS only supports separate Move (with the same name) and Rename (in the same folder) calls.

   Since the file can't be renamed and then moved (there might be a name conflict with the new name in the source folder) and can't be moved and then renamed (there might be a conflict with the old name in the destination folder), the only way to correctly execute the call on an HFS volume is to do the following:

   1) Move the file to the "<box><box><box>Move&Rename" folder.
   2) Rename the file there to the new name.
   3) Move the file to the destination directory.

   By the way, the <box><box><box> are the ASCII characters 0x01, 0x02, and 0x03, which generally don't have legitimate character representations in

most fonts. We wanted to make sure this folder wouldn't be confused with user folders, so we gave it a name that would be hard to type.

2) The "Move&Rename" folder should always be empty, except in mid-operation, and is emptied at system startup (it also is deleted at system shutdown).

3) The "Move&Rename" folder should NOT be used by anyone or anything but AppleShare and Personal File Sharing. Also, Macintosh applications are not supposed to show invisible folders in SFGetfile or SFPutFile.

Note: There is no way to prevent software from being able to see the "Move&Rename" folder or put files in it. AppleShare and Personal File Sharing absolutely require the "Move&Rename" folder.

PowerPC Business Issues: Competitive Analysis (3/95)

Revised: 3/17/95
Security: Everyone

PowerPC Business Issues: Competitive Analysis (3/95)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 17 March 1995

TOPIC ----------

This article takes a look at a number of practical business reasons why PowerPC will be the better choice of a microprocessor than Pentium. The business issues boil down to the fact that as an older architecture, Pentium is more expensive to build, will continue to be more difficult to improve, and suffers from the same shortcomings as any sole-source part. PowerPC is less expensive to produce, easier to advance, and has the advantage of being designed and manufactured by multiple sources.

DISCUSSION ----------

To best understand where the two microprocessor families stand in today's market it is necessary to take a look at the primary design criteria of both. PowerPC is a new architecture which was designed specifically to meet the computing needs of this decade and beyond. Those needs are very high performance at low cost. Intel acknowledges that Pentium was designed with backward compatibility with the installed base of DOS applications as its number one design criteria.

PowerPC's roots lie in the powerful IBM POWER (Performance Optimization With Enhanced RISC) architecture introduced in 1990. The POWER architecture is a very high performance RISC architecture designed initially for use in high end workstations and servers. PowerPC is a cost reduced adaptation of this architecture by the joint design teams of Apple, IBM and Motorola. PowerPC starting with its first its generation has always been intended for use in high performance computers, be they desktop, server, or portable.

While PowerPC's roots are in high performance computing, the x86 architecture's roots lie in the simple 4004 calculator chip which Intel built in the early 1970s. The 4004 led to the 8008 and then 8080 the immediate predecessor to the 8086. The x86 architecture was essentially defined by its namesake 8086, the grandfather of all succeeding x86 generations including Pentium. Intel had not intended to make the 8086 the basis for a long succession of chips so it

probably didn't put as much effort into designing these early-generation parts as it would have had it intended the x86 to be the foundation for many generations to come. In fact, according to John Wharton, author of many articles about Intel's x86 processors and a former Intel employee, the first generation of the 8086 was designed by three engineers in a hotel room over the course of a couple of weeks. Intel was putting its serious microprocessor design efforts into its ill fated APX432 processor.

Because the IBM Power architecture was designed with very high clock speeds and modern implementation techniques like superscalar execution and deep pipelining in mind, it was optimized for the ability to run at highspeeds and to take advantage of these implementation techniques through the use of such RISC architectural features as fixed size instructions, large register sets, and minimal number of memory addressing modes. Because the x86 was defined long before today's advanced implementation techniques were available to microprocessors (and at a time when 5 MHz was considered fast) it was designed as a complex CISC architecture which must be squeezed into these modern implementations.

Intel's effort to bring an older architecture closer to modern performance standards has resulted in a processor with a large and expensive die size, thermal output levels which has brought a new meaning to the term "a hot PC," and ultimately delivered considerably less than industry-leading performance.

Lets look at each of these factors from a business perspective:

Die size

CISC architecture microprocessors, like Pentium, typically have a higher transistor count than comparable RISC processors. And larger number of transistors will generally translate to a larger die size and higher thermal output. There has already been a considerable amount written in the press about the larger die size of Pentium relative to PowerPC but most computer buyers probably remain unaware of why the relative die size or transistor count is important to them. These characteristics directly affect the cost to produce a microprocessor. And if a manufacturer must pay more to produce a part it is likely that ultimately they will have to charge more for the part. Additionally, over the long term it will be increasingly difficult for the more expensive processor architecture to maintain its place in the market. (A more complete comparison of the transistor count and die size of Pentium and PowerPC are covered later in this paper.)

The higher thermal output of Pentium compared to PowerPC will lead to higher system costs because of the need for complex heat sinks or larger and bigger cooling fans. But the additional cost of these fans and heat sinks is not very great. The big financial impact will be on those individuals and organizations that had intended to upgrade their current 486 based systems to a Pentium based system but are unable to do so because of the significantly increased cooling requirements of Pentium processors were not considered by the manufacturers of their supposedly "Pentium upgradeable" 486 based system. (See the Appendix "Pentium Upgrade Hoax" for more details).

Development issues

Developing succeeding generations of an older architecture is likely to cost considerably more and take far longer than developing new generations of more modern microprocessors. The reasons for this again lie in the fact that much effort (both time and money) must be devoted to sections of the processor that exist primarily to maintain complete compatibility with previous generations of the processor, generations for example that were designed when the fastest anticipated clock speed was 12 MHz rather than the 120 or 200 MHz expected by the mid 1990s.

In the past, when Intel didn't face as much competition in the microprocessor business, long expensive design cycles for successive generations of processors wasn't a significant issue. But now as the microprocessor market advances rapidly, long and expensive design cycles could put the Pentium and its successors at a significant competitive disadvantage since it should take Intel longer and cost it considerably more money to design future generations of its x86 processors than it will for the PowerPC alliance members to develop succeeding processor generations. In fact, while the next generations of the PowerPC processor will ship in 1994, experts are not expecting to see the next generation of processor from Intel until 1995. Motorola and IBM have already shown samples of the next versions of PowerPC, the 603.

Problems due to sole sourcing

When a key component, like Pentium, is available from only one supplier the supplier may make decisions not in the best interest of its customers. Traditionally, electronics manufactures have been unable to sell their parts if they were the only source for those parts. The reason for this is that having a single company as the only supplier of such a key component as a microprocessor leads to a number of conditions which are less than favorable for that part's customers and the end users who are the consumers of the products.

One of the key business reasons for the ultimate success of PowerPC will be the fact that it is being manufactured and sold by multiple suppliers. In fact one of the most important reasons for the formation of the PowerPC alliance was to ensure that PowerPC would be available from more than one supplier, and that the suppliers would have to compete with each other on pricing and other single supplier issues. This section looks at some of the numerous reasons why a sole source for a microprocessor, like Pentium, is a less than ideal situation for computer manufacturers and more importantly the customers of the computer manufacturers, the party that must ultimately pay for a single sourced part.

Pricing

It doesn't take a professor of economics to figure out that if only one company is supplying a critical component that company will charge an exceptionally high price for that part. Intel has made no secret of the fact that it has fought to maintain its sole source position in x86 parts because as a sole source supplier it can charge much more for its chips than it could if there were alternate suppliers. So long as a microprocessor is available from only a single supplier (especially a supplier that spends many millions of dollars in court fighting to remain a sole source for the part) that part will be priced much higher than one that has to be priced according to market forces.

For example, fear of cutting into its very profitable 486 business is cited as one of the reasons for the high price of Pentium. Although Pentium is very expensive to manufacture, at a selling price of over $800 it should still be profitable for Intel. But, apparently because Pentium yields are low, producing more Pentium parts would require Intel to give up too much of its very profitable 486 capacity so it is slow to bring Pentium to market in the numbers its customers require.

Those who are depending on Intel for the latest generation of microprocessor lose out. They must either pay the very high chip price, or make do with older generation parts. If an alternate Pentium supplier existed Intel could not keep Pentium prices high in order to protect its 486 profits. Both experience and common sense dictate that when multiple suppliers offer similar parts, as is the case with PowerPC, lower prices are inevitable.

Availability

Shortages of the latest generation parts can easily occur in the case of a sole supplier since any glitch in that single manufacturer's process could cause a halt in production or lead to production of parts with an unacceptable bug in the part. All production of the part would have to be slowed or stopped till the sole manufacturer solved all of the problems. Intel's problems supplying bug free versions of both the 386 and 486 in the volumes and time period originally announced have been well documented.

Although it easy to see why having a single supplier for the latest generation of a processor could lead to a short supply, a sole source situation often leads to availability problems with older and less expensive parts as well. Even parts that have already gone through the learning curve problems of new chips can be subject to these shortages When a chip maker can charge much more for its latest chip than it can for older chips but it has limited production capacity for all chips, it will devote its production to building the most profitable chips. And because semiconductor manufacturing capacity is so costly and takes so long to build, a sole source manufacturer often becomes capacity limited causing it to put its customers on allocation.

Many observers believed that the acute shortage of 386 parts in 1989 and the shortage of 486SX parts in 1992 and early 1993 was due to Intel's devoting most of its fabs to building the more profitable 486DX parts. Customers that had become dependent on Intel for their processors were forced to pay more for the available higher priced parts or simply wait until the less expensive parts became available.

Multiple sources for the same chip doesn't absolutely guarantee better availability of all generations of parts regardless of their price range, but industry experience has generally shown that it does.

Design advances

A sole source supplier whose customers have become dependent on it for a key component has less incentive to rapidly advance its products or create different versions of the products. Designing advances to a processor or creating new

versions is an expensive process. It requires a large investment in time and money, and without competitive market forces a company has little incentive to make such investments until absolutely necessary.

Intel provided an excellent example of this behavior with its 486 microprocessor. Prior to the entry of AMD and Cyrix into the x86 market with 386 compatible parts (parts which Intel continues to contest in court and parts which may ultimately be determined to be illegal) Intel felt little pressure to offer different varieties of its processors. Once it felt competition from these companies though it started to design different versions of the 486. Some of these versions provided significant benefits to computer buying customers, yet it seems likely that many of these versions would never have been produced by Intel had its 486 monopoly not been breached by AMD and Cyrix.

Not only does direct competition between manufacturers spur advances but the combined resources of multiple companies makes advances possible that could be too costly or too risky for a single company to undertake. IBM, Apple and Motorola, have a combined R&D budget of over $8 billion while Intel's total R&D spending is about one tenth as much at about $800 million. The combined financial, engineering, design and manufacturing resources of the PowerPC alliance companies far exceeds Intel's resources.

Process limitations

A single manufacture is limited to using only those production processes for which it has experience or is able to obtain licenses. If a particular processor architecture can only be produced by a certain process or if a certain process is necessary for the production of certain speeds of a processor a sole source producer (and its dependent customers) would be at a significant disadvantage. The first generation of PowerPC, the PowerPC 601, is available from both Motorola and IBM even though it is being produced using IBM's advanced .6 micron technology.

Because Intel does not yet have sufficient .6 micron production capacity and it has not licensed any second sources, the Pentium processor is currently being produced with Intel's less-advanced .8 micron technology. But Intel, and its customers, would be better off if Pentium was currently being produced with the more advanced .6 micron technology. By the time Intel is able to produce significant volumes of Pentium with .6 micron technology IBM and Motorola should already be producing the next generation of PowerPC in .5 micron technology.

The combined technology and production resources of two of the best semiconductor manufacturers in the world should insure that PowerPC customers will always have the best process technology available.

PowerPC Technical Issues: Competitive Analysis (3/95)

==========

Article Created: 27 January 1994
Article Reviewed/Updated: 11 March 1994

TOPIC ----------

The article "PowerPC Business Issues: Competitive Analysis" covered some of the business reasons why Pentium and its follow-on processors will be at an increasingly great disadvantage relative to PowerPC. This article looks at some of the many technical reasons why an aging CISC architecture such as the x86 architecture of Pentium is at a significant technical disadvantage to a modern RISC architecture like PowerPC.

DISCUSSION ----------

But without looking at a single technical advantage the reader can note that the largest computer manufacturers in the world, in all categories of computing, supercomputers, mainframes, minis, workstations and now personal computers have all made a commitment to RISC architecture, despite the fact that they have all risen to their current positions by selling CISC based computers. It should be obvious that if these companies, with their vast technical expertise and huge stake in CISC technology have concluded that CISC is a dead end and that RISC computing is the future, there must be some very sound technical reasons. Surely the leaders of all the various categories of computing, companies like of Cray, IBM, DEC, HP, Apple, Sun, and others would not invest their futures in RISC technology if CISC technologies couldn't be pushed to keep up. But all of these companies and many more have come to the inevitable conclusion that, in the final analysis, the most important criteria for a viable computing architecture is performance and price/performance. And when it comes to performance and price/performance the CISC architectures of the 70s, no matter what techniques are used to push them into the 90s, simply will not be able to keep up with a modern RISC architectures such as PowerPC.

Not only have the top computer companies chosen RISC but the world's largest semiconductor companies, companies that have also have risen to dominance in a CISC world, have seen the advantages of RISC and with a single exception have all made major commitments to RISC. The one major exception is of course Intel,

the maker of Pentium, and the company with the most to lose as the CISC era comes to a close.

Because it is now widely accepted within the computer design community and beyond that RISC microprocessor architectures are superior to CISC architectures Intel has started calling its CISC architecture, "RISC-like." But this is simply a marketing department's attempt to gloss over a major architectural weakness. A CISC architecture can not be a RISC architecture anymore than Byzantine Architecture can become Modern Architecture.

The difference between an architecture and an implementation A microprocessor architecture, like a building's architecture, embodies the underlying design philosophy and potential capabilities of that microprocessor. The architecture includes such design decisions as the number of and size of the instruction registers, the manner in which instructions are moved to and from memory, whether or not floating point numbers are a standard data type, etc. A microprocessor implementation on the other hand is similar to the materials that are used to build a building. The microprocessor's architecture is the ultimate determinant of what the microprocessor is capable of and how it will do it. Once an architecture has been defined there is no going back. Byzantine architecture is Byzantine architecture regardless of whether it is implemented in stone or concrete.

Intel proponents try to convince the market that the 486 and Pentium are, "RISCy" or "RISC-like" by pointing to certain features in the current implementations that are also used in RISC processor implementations. Intel's hope is to confuse the unwary by pointing to implementation techniques such as pipelining and superscalar execution, while ignoring the actual architecture. But it is the architecture that defines whether a processor is CISC or RISC and the architecture is fixed very early in the life of a processor family. The initial foundation of the Intel x86 architecture was set in place by the 8080 in 1972. And the blueprint of the x86 architecture was drawn up for the 8086 in 1978. The architecture has expanded since then but in order to maintain complete backward compatibility with all previous x86 software the basic x86 architecture must remain unchanged. The best that Intel can hope for is to implement some of the techniques in their newer processors that are used in more modern RISC processors. The number of techniques that they are able to borrow and the extent to which the x86 architecture can benefit from these techniques is limited by the design decisions made way back in the early 1970s.

Don't be misled. A microprocessor's architecture can not be changed by its marketing department; just because Pentium uses some of the same implementation techniques used by RISC architecture processors, it is not RISC. Only those processors that have been initially designed as a RISC architecture are RISC. And it is only those processors which can fully derive the price, performance, and other benefits of a modern RISC architecture.

Why should a user care whether a microprocessor is RISC or CISC?

The only reason why a user should care about whether or not a processor is RISC or CISC is if they want to be able to choose the architecture with the best performance, best price/performance and the ability to rapidly advance to even higher levels of performance and price/performance over time. Comparing PowerPC

to Pentium is a good example of how a modern RISC architecture compares to an older CISC architecture on these criteria. PowerPC delivers a higher level of performance than Pentium and is able to do so with fewer transistors, in a smaller die, at a lower price. These are not unrelated features. Fewer transistors means smaller die size and less heat. A smaller die size allows for a less expensive chip.

Pentium vs. PowerPC Comparison Chart

Feature	Pentium	PowerPC 601
Architecture	32-bit CISC	64-bit RISC(7)
Age of architecture	15-20 years(1)	3 years
Maximum instructions per cycle	2	3
On-chip cache size	16 KBytes	32 KBytes
Core logic transistor count(2)	~2.2million	~1.3million
Die size	262.4mm2	118.8mm2
Estimated manufacturing cost(3)	$483	$76
Heat dissipation @66 MHz	13 watts	7 watts
General Purpose Registers	8 32-bit	32 32-bit
Floating Point Registers	8 80-bit	32 64-bit
Primary operating system	16-bit (4)	32-bit(5)
Follow on processors	NA(6)	603, 604, 620

Notes for Table:
1) Depending on whether the 8080 or the 8086 is used as starting point.
2) Total transistor count less transistors devoted to on-chip cache
3) Based on Micro Design Research estimates published 8/2/93
4) DOS and Windows 3.1
5) System 7
6) Intel has not announced additional x86 processors.
7) PowerPC 601 is a 32-bit implementation of the 64-bit PowerPC architecture

CISC architecture requires more transistors

RISC processors can generally achieve higher performance with fewer transistors. Pentium, the latest generation of x86 processor, uses over 3.1 million transistors to achieve integer performance similar to that of PowerPC 601 using only 2.8 million transistors. But nearly a half of the 601's transistors are used by the 32 KB on-chip cache while Pentium uses only a quarter of its transistors for the cache. Comparing the core logic of the two processors shows that Pentium uses nearly a million more transistors (2.2 million) devoted to actual core logic than the PowerPC 601 (1.3 million) to achieve roughly the same level of integer performance and substantially lower floating point performance.

Pentium requires far more transistors devoted to core logic in order to implement its CISC architecture. The considerably higher core logic transistor count increases the cost of Pentium, imposes barriers to easily achieving higher clock speeds, and contributes to increased heat.

All future versions of the x86 architecture will be similarly afflicted with

large transistor counts in order to maintain their architectural heritage. Intel will undoubtedly be able decrease the size and improve the heat dissipation of Pentium somewhat, but future versions of the x86 will likely continue to be at size, cost, heat and probably clock speed disadvantages to PowerPC chips.

The cost of manufacturing Pentium vs. PowerPC

No semiconductor company publishes its actual cost of manufacturing various chips. But by looking at the various factors that affect the cost of making a chip, a fairly good estimate of the cost of producing a microprocessor can be made. MicroDesign Resources recently took a look at these factors for both PowerPC and Pentium. Examining a number of variables, including die size, wafer size, estimated yield, packaging and test costs they estimated that it currently costs Intel approximately $480 to produce a single Pentium chip while the cost of manufacturing a PowerPC 601 chip was estimated at $75. This is a tremendous differential, and there is little to suggest that Intel can close this cost gap. Because as an Intel VP recently stated in the Wall Street Journal both Pentium and PowerPC are subject to the same cost dynamics the cost of manufacturing both processors can be expected to decline at approximately the same rate. And equally important it can be expected that future generations of both processors will have a large cost delta as well.

Future Performance

The fact that PowerPC is only in the first generation of its life cycle while Pentium is already over 15 years and many generations into its life cycle has some important implications for expected performance difference over time. InfoCorp looked at the various factors likely to influence the performance of Pentium and PowerPC over the next few years. This information together with previously published information available from both Intel and Motorola was used to create the following chart. This chart shows the absolute performance levels of both Pentium and announced versions of PowerPC. Both Pentium and PowerPC start out with approximately equal integer performance in their current generations and both improve considerably over time. But as is obvious from the chart InfoCorp expects future generations of PowerPC will outperform Pentium by many times. Had InfoCorp chosen to chart the floating point performance of the two the performance advantage of PowerPC would be even more dramatic.

Intel's emulation performance FUD (Fear, Uncertainty, Doubt)

Those in the Intel camp like to make statements like, "PowerPC can only run DOS applications in emulation mode which is unacceptably slow." They often go on to state that "emulation is many times slower than running native."

What the Pentium camp conveniently forgets is that because PowerPC is many times faster than a typical 486 the PowerPC can still deliver high performance even when running DOS emulation. Considering that the only reason many users would even want to run older DOS applications is to run things like a terminal emulator or a text editor that they have become used to performance should not be a significant issue.

Intel is also trying to confuse customers about the performance of Macintosh

applications running on PowerPC. Because Apple has control over both its hardware system design as well as its operating system it is in a position to ensure that current Macintosh applications will run with good performance on PowerPC based Macs. By rewriting performance critical parts of System 7 Apple has relieved software developers from the need to rewrite their existing software to run well on PowerPC based Macs. And customers will be able to run their current software on the new PowerPC based Macintosh computers without having to purchase new applications or an emulator.

Upgrades

Many users are excited by the possibilities of next generation processors like PowerPC and Pentium, but until computers based on these chips are more widely available they can't buy one. The obvious answer for these customers is some sort of an upgrade to their existing systems. Both Intel and Apple plan on offering upgrades to next generation processors to their customers.

Pentium Upgrade Hoax

Intel's inability to produce Pentium processors in large volume has caused it to pursue another strategy in order to take advantage of the hype it has created for Pentium. Intel has convinced most of the companies which manufacture 486 based PCs to include a socket on their motherboards to accommodate some sort of Pentium upgrade processor. This processor which was originally code named P24T is now called Pentium OverDrive. The PC trade press though has reported a number of reasons why an end user who purchases a 486 based computer in anticipation of upgrading his machine to a "Pentium" based processor may be in for a disappointment.

Most of the reasons are related to the high thermal output of Pentium and the reduced performance a user can expect when putting a 66 MHz "64-bit" processor into a 33 MHz board designed for a 32-bit processor.

The problems which Intel faces with the Pentium OverDrive are not just speculation on the part of industry analysts. Intel admits that there is an upgrade problem. One of the ways it has attempted to address this problem is by redefining the socket specifications for the Pentium OverDrive processor. The current version of the socket being used is already on its third iteration, (it's called Pentium OverDrive 3) and the Pentium OverDrive part has not even been announced yet, much less shipped. And Intel itself has acknowledged that there are some supposedly Pentium upgradeable systems being shipped by various PC manufactures which will not be Pentium upgradeable as advertised.

PowerPC Upgrades

Apple has announced that low cost PowerPC upgrades will be available for most of the current Macintosh computers, and third party manufacturers are developing PowerPC upgrade boards for other Macintosh models. There are some critical differences though between the PowerPC upgrades for Macintosh computers and the Pentium OverDrive upgrades being advertised by Intel. Because the PowerPC 601 chip has a thermal output not significantly higher than current high end 68040 processors heat dissipation should not be as critical an issue. From a compatibility standpoint, compared to the hundreds of different 486 based

systems that Pentium OverDrive must be compatible with, there are relatively few models of Macintosh which need to be tested for compatibility. And because unlike the Pentium OverDrive, which is not yet shipping, the PowerPC chip is already shipping it can be tested in actual Macintosh computers. The lower cost of the PowerPC processor compared to announced Pentium pricing will allow Apple to make PowerPC upgrades available to current Macintosh owners at a very reasonable price.

Conclusion

PowerPC is an advanced, modern microprocessor architecture designed and manufactured by the world's leading semiconductor and personal computer companies. And as such, PowerPC has a number of key technical and business advantages over the older CISC based architecture, Pentium, being offered by a single supplier, Intel. And while Intel would like the market to believe that Pentium's ability to run all existing DOS applications will be the only important feature when choosing a microprocessor architecture IBM, Apple, Motorola, and an increasing number of industry observers believe that PowerPC's superiority in the areas of price, performance, time to market, multiple sourcing, and salability to higher performance levels, will be even more important especially in light of PowerPC's ability to run the vast majority of the installed base of existing software, and to run that software at a performance level higher than many customers are able to run them on their current Intel based hardware. Businesses can not afford to handicap themselves with an aging architecture when newer higher performance more cost effective solutions will be adopted by their competitors.

While those customers not currently held captive to the Intel's aging x86 architecture will be the first to reap the benefits of a migration to PowerPC, those with substantial investments in commercial and custom applications currently running on an x86 processor will also be attracted by the price, performance, availability and future of the PowerPC architecture. Those who believe that customers will not migrate to a clearly superior technology are probably the same group who thought that technically superior CDs could never replace the vast installed base of vinyl LPs.

RISC and CISC, Why the Difference: Competitive Analysis (3/94)

==========

Article Created: 28 January 1994
Article Reviewed/Updated: 11 March 1994

TOPIC

This article describes some of the differences between RISC and CISC computer architectures and the implications for the PowerPC and Pentium processors.

DISCUSSION

RISC computer architectures take advantage of features such as simple memory addressing and fixed length instructions to achieve higher performance levels than CISC processors which use variable length instructions and multiple memory addressing modes. To understand why the designers of RISC processors decided to use less complex (reduced) instructions than CISC processor designers it's necessary to understand something about the systems for which these processors were designed. The following is but one example of the type of design trade-off decisions made in developing a processor architecture.

CISC computer architectures were originally developed in the 1960s and 1970s, an era when a computer's available memory was both very limited and quite expensive, and many of the processor design decisions made at the time were based on minimizing the program memory requirements. One way to reduce program memory requirements was to simplify software as much as possible by building more complexity into the processor itself. Although increasing the complexity of the processor had a negative impact on processor performance, it was a reasonable trade off at the time. After all, it didn't matter how fast your processor could run if you didn't have enough memory left to load your data and run your programs. But as the price and availability of memory improved there was a need to reexamine the performance versus complexity trade offs. An architecture that made sense in the 1970s when a computer might have only 16 or 32 kiloytes of memory might not be an optimum architecture in the 1990s when 4 or 8 megabytes of memory would be standard.

The goal of a RISC architecture is to allow instructions to be executed as fast as possible. One of the ways of accomplishing this was to simplify the number and type of instructions. The smaller and simpler instructions of a RISC processor could run faster than the longer and more complex instructions of a CISC processor. Of course, this would require moving some complexity into the computer's software programs which, in turn, would require more system memory and better compiler technology. By the mid-1980s with compiler technology quite advanced and memory more readily available, although still expensive, RISC processors made sense for high performance workstations where the cost of memory was not an important issue. And now in the 1990s with very advanced compilers widely available and 8 megabytes or more of memory becoming common, high performance of RISC computing makes sense even for personal computers.

The market conditions that made CISC technology the right choice for personal computers in the 1970s, limited system memory and modest performance requirements, have been replaced by new conditions in the 1990s, inexpensive memory and heavy performance demands. And these requirements of the 1990s are the very conditions which RISC processors were designed for.

Floating point

Intel's engineers and marketing people seem to be at odds over the importance of fast floating point performance. Intel engineers devoted a considerable amount of resources to improving the poor floating point performance of the earlier x86 processors. This effort is reflected in the relatively large amount of space devoted to floating point execution on the Pentium processor. Yet the baggage of the x86 architecture was so great that the Intel engineers were only partially successful in improving floating point performance. Pentium is faster than the 486 in floating point but significantly slower than PowerPC and most current generation processors. As a result Intel marketing people now go out of their way to de-emphasize the importance of floating point.

The truth is floating point performance is not critical for some of today's typical desktop computing tasks such as word processing or database programs, so Pentium's lack of good floating point performance is not too critical for these applications (or at least for the versions of these applications that have been written thus far.) But for the large number of professionals that depend on their computers for financial calculations, high-end graphics or digital imaging, the lack of sufficient floating point performance could make them less competitive. And in the future, fast floating point performance will enable new and far better versions of many existing applications as well as enable new classes of applications that require fast floating point. To the extent that users will want to run these newer applications fast floating point will become essential.

Applications are getting cheaper

The DOS/Windows installed base has far more invested in its data than it

does in its applications. Because the price of applications continues to drop, and because data is the easiest thing to move between platforms, customers will have less and less reason to stay with the declining architecture.

Number of fans

It used to be that the latest x86 based PC would brag about its high clock speed or MIPS rating. Now many of the current press releases and ads for upcoming Pentium systems talk about the number of fans a system includes. It is quite likely that in the near future PC trade magazines will start counting the number of fans a system includes as part of the system's overall rating. The need to have multiple cooling fans is not a particularly desirable trait for a microprocessor. Fans, which are mechanical devices, have a much higher failure rate than any of the electronic components used in computers. So a computer that depends on fans for cooling the CPU will have a reliability rating (MTBF) similar to the relatively low MTBF of its fans. Multiple cooling fans also generate considerable noise. While this noise may not be an issue for file servers in closets it can be quite irritating in a desktop computer.

Intel's reaction

Intel's reaction to the introduction of PowerPC has been unusually vigorous. This is no doubt due to the fact that possibly for the first time it faces a significant threat to its high-end microprocessor business. Intel apparently feels so threatened by PowerPC that it has started running ads in Macintosh oriented publications extolling the virtues of Pentium and the x86 architecture. But MacUser in commenting on the veracity of Intel claims noted that a close look "revealed more obfuscation than clarification".

LaserWriter Pro 810: If It Won't Select Correct Tray (1/94)

Revised: 1/31/94
Security: Everyone

LaserWriter Pro 810: If It Won't Select Correct Tray (1/94)

==========

Article Created: 31 January 1994

TOPIC ----------

I'm having a problem getting my LaserWriter Pro 810 to select a specific paper tray.

DISCUSSION ----------

The cure is to restore factory default settings. Here's how:

1) Turn the printer on and wait until it comes ready.

2) Locate the control panel and press the On-line button to force the printer "Off-line".

3) Press the Menu button.

4) Press the down arrow until "Misc." appears in the display, then press Enter.

5) Press Enter again to select "Restore Factory Setup".

6) Press Enter when the "Factory Setup" question appears.

When you've done all this, the printer will display "Confirmed" and run a self-test. The printer will return to the ready state once the self-test is complete.

Macintosh LC 575: Specifications (Discontinued)

Revised: 8/19/96
Security: Everyone

Macintosh LC 575: Specifications (Discontinued)

==========

Article Created: 2 February 1994
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article provides technical specifications for the Macintosh LC 575 computer. Note that, in the U.S., this model is sold only through educational channels.

DISCUSSION ----------

Microprocessor

- MC68LC040, 33 MHz clock speed; 32-bit data bus
- Built-in memory-management unit

Memory

- 4MB RAM on logic board
- Expandable (by authorized Apple dealer) to as much as 36MB by adding 1MB, 2MB, 4MB, 8MB, 16MB, or 32MB SIMM to a single 72-pin slot. Requirement: 72-pin fast-paged, 80ns or faster.
- 1MB ROM

Storage

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 160MB or 320MB hard disk
- Internal AppleCD 300i Plus CD-ROM drive with new tray-loading design
  - Does not require a CD caddy
  - Average access time: 295 ms
  - Capacity: 650MB
  - Supported formats: Multisession Photo CD, High Sierra (ISO 9660), Macintosh HFS, Audio CD, CD + G/CD + MIDI, CD-ROM XA, CD-I
- Start-up (bootable) CD-ROM with system software

Video Display

- Integrated Macintosh Color Display with 14-inch Trinitron CRT
- Resolution: 640 x 480 pixels, 69 dpi, .26 mm dot pitch
- Two VRAM expansion slots:
  Standard 512K VRAM supports 256 colors (8-bit color)
  Optional 1MB VRAM supports 32,768 colors (16-bit color)

Interfaces

- Internal expansion slot for one Macintosh LC processor-direct expansion card. Compatible with Apple IIe Card.
- SCSI interface for connecting up to five external devices
- Communication slot can be easily configured -- by the user -- to accept any of three Ethernet cards (10BASE-T, Thin Coax, Apple AUI), or a high-speed 14.4 KB fax/modem (based on PowerBook Express Modem).
- Two serial (RS-232/RS-422) ports
- One stereo sound-output port for external audio amplifier or headphones
- One Apple Desktop Bus (ADB) ports for keyboard, mouse, and other devices
- Front headphone jack
- Built-in microphone above display
- One sound-input port for four sources: internal or external microphone*, internal CD-ROM, or external audio.

* Note: Requires the PlainTalk microphone.

Pull-out Logic Board

Allows easy upgrades to DRAM, VRAM, PDS, and communication slot.

Sound Generator

- Stereo 8-bit digital-analog conversion using 22-kHz sample rate, capable of driving stereo headphones or other stereo equipment through the sound jack and headphone jack
- Two built-in stereo speakers
- CD output is 16-bit digital

Keyboard and Mouse

- ADB Mouse II
- Keyboard purchased separately only in the K-12 configuration; several ADB keyboards with numeric keypads available

Clock/Calendar

- Custom integrated circuit with long-life alkaline battery.

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 90 to 264 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 40 W maximum, not including display
  60 W maximum, including display
- Energy-saving feature reduces power consumption by 50%
- One AC outlet powers computer, display, drives, and speakers

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA, depending model used

System Software

Requires System 7.1 or later and the System Enabler 065.

Size and Weight

Main unit:

- Height: 17.9 in. (45.5 cm)
- Width: 13.5 in. (34.4 cm)
- Depth: 16.5 in. (42.0 cm)
- Weight: 40.5 lbs (18.4 kg)

Mouse:

- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz. (0.10 kg)

Operating Environment

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: –40 to 116.6° F (–40 to 47° C)
- Relative humidity: 20% to 85% noncondensing
- Maximum altitude: 15,000 ft. (4,722 m)

Article Change History -
19 Aug 1996 - Corrected misspelling.
16 May 1995 - Added microphone information.
29 Jun 1994 - Added information regarding VRAM slots.

LC 520 and Performa 550: Upgrade to LC 575 (Discontinued)

Revised: 12/1/94
Security: Everyone

LC 520 and Performa 550: Upgrade to LC 575 (Discontinued)

==========

Article Created: 2 February 1994
Article Reviewed/Updated: 01 December 1994

TOPIC ----------

Can a Macintosh LC 520 or a Performa 550 be upgraded to a Macintosh LC 575?

DISCUSSION ----------

Yes. The logic-board upgrade is part number M2479LL/A.

Article Change History:
01 Dec 1994 - Noted that upgrade is discontinued.

Macintosh LC 575: Why an Alkaline Battery (2/94)

Revised: 1/31/94
Security: Everyone

Macintosh LC 575: Why an Alkaline Battery (2/94)

==========

Article Created: 2 February 1994

TOPIC --

The back-up battery in the Macintosh LC 575, the battery that maintains the computer's clock/calendar even when the system is unplugged, is an alkaline battery. Previous Macintosh models have contained a lithium battery for this purpose. Why the change?

DISCUSSION --

The Macintosh LC 575 is the first Apple desktop system to ship with this kind of battery. These batteries are the same as in many DOS/Windows PCs. They are readily available, easy to install, last about the same amount of time as lithium batteries, and should cost less.

Apple License Mgr: How Much Network Traffic Generated? (2/94)

Revised: 2/4/94
Security: Everyone

Apple License Mgr: How Much Network Traffic Generated? (2/94)

==========

Article Created: 4 February 1994

TOPIC -----

I need some information on Apple License Manager, which controls the software serial number tracking feature of AppleShare 4.x. I understand that Apple Licence Manager searches across the network to check serial numbers.
My questions are:

- How much network traffic does Apple License Manager generate?
- How often do the searches occur?
- Does Apple License Manager search LAN or WAN wide?
- How big are the packets?
- When a serial number violation is found, is server performance affected in any way?

DISCUSSION -----

We designed Apple License Manager (ALM) to keep the generated traffic as low as possible, especially when two LANs are connected by a router over a slow link such as X.25. This is one of the reasons we did not use Name Binding Protocol (NBP) directly. The Apple License Manager implements a new protocol Apple Serial Number Registration Protocol (ASNRP) and in its first implementation uses Datagram Delivery Protocol (DDP) and Routing Table Maintenance Protocol (RTMP).

RTMP is used to acquire network information, which is basically the network number range tables. It refreshes this information every hour by sending an RTMP request to A-router. RTMP is described in Inside AppleTalk. The number of RTMP packets is not significant (Our engineering net is composed of about 700 network number ranges; this gives 1 request and 5 responses every hour).

ASNRP also implements a general purpose multiplexed sharing socket protocol - known as broadcast protocol. It utilizes a static socket reserved by Apple for this purpose.

When a application has registered a Network Serial Number, ALM will be able to respond to any request matching this serial number, but it does not generate any requests until an application calls for a search. Then, every "X" seconds, ALM will pick a network number and send a request on this net. "X" can vary from 30 seconds to 2 minutes, depending of the size in network numbers of the internet. So, the search can take a long time to complete, but it generates little traffic. Once the search is completed, the application is free to call for another search.

AppleShare 4.0, for example, is continuously searching the entire internet sorted by hops during the first search at startup and then randomly. If a duplicate is found, then it requests the Apple License Manager to search using the cache of duplicates every 5 minutes to verify that the duplicate has not gone away. This search does not generate more traffic; it only changes the order the network numbers are searched.

The size of a request is just less than 100 bytes, and a response would be 40 bytes more.

Here is what AppleShare 4.0 does when it finds a duplicate serial number:

Time	Action
1) First Detection	Duplicate detection dialog displayed on each server
2) Four hours later	Set the greeting message to the duplicate detection dialog
3) 76 hours since first detection	Start sending out the duplicate detection dialog every hour
4) 112 hours since first detection	Start sending out the duplicate detection dialog every 30 min
5) 148 hours since first detection	Start sending out the duplicate detection dialog every 15 min

If at any time during the duplicate detection process, no more duplicate servers are detected, the duplicate detection dialog will go away.

PLW 300: HyperCard Prints at Quarter Size (2/94)

Revised: 2/23/94
Security: Everyone

PLW 300: HyperCard Prints at Quarter Size (2/94)

==========

Article Created: 21 February 1994

TOPIC ----------

When I print a card or stack from HyperCard version 2.1 or 2.2 to a Personal LaserWriter 300, the image is printed quarter-size (25% of normal). This problem didn't occur when I printed the same image from HyperCard to an ImageWriter and LaserWriter IINT.

What causes this?

DISCUSSION ----------

This is a known bug in HyperCard (including version 2.2). It also occurs when printing from HyperCard to the Personal LaserWriter LS and LaserWriter Select 300 since all of these printers use the same printer driver.

Since each image is reduced to quarter-size, the workaround is to set the Page Setup "Reduce or Enlarge" value to 400% for full size images, 200% for half size images, and 100% for quarter size images.

LaserWriter Select 360 Fax: Importing Phone Book Entries (2/94)

Revised: 2/7/94
Security: Everyone

LaserWriter Select 360 Fax: Importing Phone Book Entries (2/94)

==========

Article Created: 1 February 1994

TOPIC ----------

I just installed the software for the LaserWriter Select 360 with Fax card. I want to import my existing fax phone list which is already an ASCII text file containing three fields -- the format noted in the user's manual.

When I select the phone book file for import, I get an error message stating that the file is of the wrong file type. What am I doing wrong?

DISCUSSION ----------

The import feature is very particular about the data format for the import file. Unfortunately, the user's manual forgets an important field and carriage returns after all phone entries. Any changes from the designated format (that is, missing field, tab, or carriage return) will always yield an error when trying to import the data. The format should be as follows:

NAME (tab) COMPANY (tab) FAX NUMBER (tab) POSTSCRIPT (Y/N)? (tab) (return)

Note:

- You can leave fields blank as long as you insert a tab as a placeholder.

- The POSTSCRIPT field should contain a "Y" if the receiving device is a PostScript FAX-capable device.

In order to view a sample file that you can import, we suggest exporting your existing phone book entries using the export button. Open the file that was created using Microsoft Word or MacWrite Pro.

From within the word processor select "show invisibles" to view the tabs and carriage returns.

LW Pro 810: Enet Ptr Name Maximum 16 Chars (2/94)

Revised: 7/20/95
Security: Everyone

LW Pro 810: Enet Ptr Name Maximum 16 Chars (2/94)

==========

Article Created: 1 February 1994

TOPIC ----------

When I configured a LaserWriter Pro 810 on an Ethernet network, the Chooser name is truncated to 16 characters long. The full printer name, however, is displayed on the status page and in the Chooser when using LocalTalk.

Can the LaserWriter Pro 810's Ethernet printer name ever be longer than 16 characters?

DISCUSSION ----------

No, the LaserWriter Pro 810 Ethernet printer name is limited to 16 characters.

Previous LaserWriter printers have had plenty of EEROM space to store printer names. The LaserWriter Pro 810 supports up to 64 'virtual' printers with their own name and configuration variables that must be stored in non-volatile memory. In order to provide sufficient EEROM space, the LaserWriter Pro 810's non-LocalTalk printer names were truncated to 16 characters.

Page 43 of the LaserWriter Pro 810 User's Guide contains a small note explaining that the Ethernet printer name is limited to 16 characters.

Macintosh with PC Emulation in Banyon VINES Environment (2/94)

Revised: 2/7/94
Security: Everyone

Macintosh with PC Emulation in Banyon VINES Environment (2/94)

==========

Article Created: 7 February 1994

TOPIC -----

This article tells you how to enable a Macintosh running PC emulation software (SoftWindows with SoftNode) to access a BANYAN server, and use its services. The configuration described here works for Banyon VINES SoftNode or Banyon VINES.

DISCUSSION -----

1) The Banyan Macintosh client runs on top of NDIS and uses Ethernet II frames with a magic number of 0xBAD. So to run it with SoftNode, you must first set up the NET.CFG file to reflect this. The following is a sample Banyan NET.CFG file for SoftNode Ethernet:

```
Link Driver ETHERSPC
    Frame ETHERNET_802.3
    Frame ETHERNET_802.2
    Frame ETHERNET_II
    Frame ETHERNET_SNAP
    Protocol BANYAN BAD ETHERNET_II

Protocol ODINSUP
    Bind ETHERSPC
```

2) Run the following to set up SoftNode for Banyan:

```
LSL
ETHERSPC
ODINSUP
```

3) Configure VINES. Include the line:

```
device=c:\banyan\protman.dos /i:c:\banyan
```

in the CONFIG.SYS file. If you've installed the software somewhere instead of c:\banyan, substitute your directory here. The configuration file for PROTMAN.DOS is called PROTOCOL.INI. It should be in the c:\banyan directory and should contain the following:

```
[protocol manager]
  drivername = PROTMAN$

[VINES_XIF]
  DRIVERNAME = NDISBAN.DOS$
  BINDINGS = ETHERSPC
```

4) Run PCCONFIG, the Banyan configuration program. Choose the first option, "Network Card Settings," choose "NDIS Ethernet." Then in the configuration screen, configure IRQ 10, driver name ETHERSPC. Press F10 to save the changes. Then choose the second option, "Login Environment Settings," and configure NDIS Ethernet. Press F10 to save the changes.

5) Restart for the CONFIG.SYS changes to become effective and run the ODI side and ODINSUP as described. Then type the following to get VINES going (from the Banyan directory, or wherever you have put it).

   ban /nc (Ignore the "network driver not enabled" message. It means it's working!) ndisban netbind arswait redir4 z: login

If you can run everything, but can't access files on the Z: drive, you probably left out the Protocol line in the NET.CFG file.

Continual Mounting Of A Remote Disk (8/94)

Revised: 8/23/94
Security: Everyone

Continual Mounting Of A Remote Disk (8/94)

==========

Article Created: 3 February 1994
Article Reviewed/Updated: 23 August 1994

TOPIC -----

Whenever I start my Macintosh, it asks me to log onto another drive on the network, and I can hit cancel 50 times before it goes away.

I don't think this is related to an AppleShare File Server or File Share, under System 7, set to open at system startup, because I've checked those. What could be causing this?

DISCUSSION -----

If throwing the AppleShare Prep file in the Trash doesn't solve the problem, you should check to see if Suitcase is installed. It has a feature which allows a user to connect to another users hard disk which has Suitcase installed. You can either move Suitcase out of your System Folder, or remove the reference to the remote disk in Suitcase.

System 6 Clean Installation (8/94)

Revised: 6/5/96
Security: Everyone

System 6 Clean Installation (8/94)

==========

Article Created: 3 February 1994
Article Reviewed/Updated: 29 August 1994

TOPIC ----------

This document tells you how to do a clean System 6 installation. A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It's also useful in troubleshooting, and helps to determine whether a problem is hardware- or software-related.

DISCUSSION ----------

Required Disks

System 6 software comes as a set of 800K (double-density) disks or a set of 1.44MB (high-density) disks:

- The set of four 800K disks includes System Tools, Utilities 1, Utilities 2, and Printing Tools.

- The set of two 1.44MB disks includes System StartUp and System Additions.

The instructions in this document give the name of the 800K disk first, followed by the name of the 1.44MB disk in parentheses. Follow these instructions in the order presented.

Restart with Utilities 1 or System StartUp

Shut down your Macintosh computer, insert Utilities 1 (or System Startup) in the

floppy drive, and turn on the computer. At the desktop, the floppy disk's icon should be in the upper-right corner of your screen with the hard disk's icon below it.

If the computer ejects the disk and won't start up from it, check the density of the disk. A high-density (1.44MB) disk requires an Apple SuperDrive (formerly FDHD) to read it. Macintosh computers, except the Macintosh Plus, SE, II and earlier, have SuperDrives.

If your computer doesn't have a SuperDrive, you need the set of 800K System 6 installation disks. To get them, contact your local Apple dealer or User Group for a copy (they may charge a fee).

Run Disk First Aid

Disk First Aid is a utility found on the Utilities 1 (or System StartUp) disk. It can detect and repair problems with the hard disk.

1) Double-click the Utilities 1 (System StartUp) icon to open it.

2) Double-click on Disk First Aid, and make sure the startup hard drive is selected. If it isn't, click the Drive button to select the startup hard drive.

3) Click once on Open and then once on Start. Disk First Aid checks your hard disk for any potential problems. If it finds problems, you should let the software repair them.

4) Repeat this procedure for each hard disk attached to the system.

5) When you're finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid can't repair a hard drive, you should back up the hard drive and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup.

Check Available Hard Disk Space

Be sure you have at least 3072K of disk space available on the hard disk where you're installing the system software. Double-click on the hard disk icon, and choose by Icon from the View menu. The upper-right corner of the window displays the amount of available disk space.

If there's less than 3072K available, you'll need to delete some unnecessary files. Copy files to floppy disks or other media if needed. Then drag the files from your hard disk to the Trash, and choose Empty Trash from the Special menu.

Disable the System Folder

You disable the System Folder by moving the Finder and renaming the System Folder.

1) Open your hard disk's icon and locate the System Folder.

2) Open the System Folder.

3) Create a new folder and name it "Old Finder."

4) Locate the Finder (within the System Folder) and move it into this new folder.

5) Close the System Folder's window and rename the System Folder, "Storage."

6) Close any open windows on your desktop.

Restart Your Computer

Choose Restart from the Special menu. The system automatically ejects the floppy disk, and after a few seconds you should see a picture of a disk with a flashing question mark. This indicates that no System Folder is active on the hard disk.

If your Macintosh starts up from the hard disk, you have an extra System Folder on the hard disk. You need to delete it (or disable it as described in the previous section), then restart.

If your computer starts up from a second hard disk connected to your computer, you'll see that disk's icon in the upper-right corner of your screen with the startup hard disk's icon below it. If this happens, you can continue installation without waiting for a blinking question mark.

Install System 6

Install System 6 following these steps:

1) Insert System Tools (or System StartUp) into the floppy drive.

2) Double-click the Installer application icon.

3) Once the "Welcome to the Apple Installer" message appears, click OK.

4) The Installer will indicate the name of the disk where it's installing the system software. Click Switch Disk if necessary until you see the name of the correct disk. Then click Install.

5) Insert the other disks when the Installer asks you to.

6) When installation is complete, quit the Installer program, and restart the Macintosh.

The system will eject the floppy disk and the Macintosh will start up from the hard disk.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks aren't available, you may move the non-standard items from the Storage folder to the new System Folder. Be careful not to replace anything that's already in the new System Folder. Only move items that aren't already in the new System Folder.

1) Open the System Folder and the Storage folder and choose by Name from the View menu. Then compare the contents of the folders as they are open side-by-side.

2) Move anything that isn't already in the new System Folder from the Storage folder to the new System Folder.

3) Restart your Macintosh.

Install Fonts and Desk Accessories

Fonts and desk accessories become part of the System file. You need to reinstall them after a clean installation. Use the original disks to install them. If the original disks aren't available, follow these steps:

1) If the Font/DA Mover isn't on your hard disk, copy it from the Font/DA folder located on the Utilities 2 (or System Additions) disk to your hard disk.

2) Open the Font/DA folder on the hard disk, and double-click the Font/DA Mover to launch it. You see two windows. The radio button at the top indicates whether you're viewing fonts or desk accessories. The default is to view fonts. The left window displays fonts installed in your system, and beneath it you see "System on <hard disk name>."

3) Click the Open button beneath the window on the right.

4) When a dialog box appears, navigate to the Storage folder, and open it.

5) Double-click the System file to open it. You'll see the fonts in your old system in the window on the right.

6) Select the fonts you wish to add to the new system, and click on the <<Copy<< button.

7) When finished installing fonts, use the radio button at the top to display desk accessories.

8) Select the desk accessories you wish to add to the new system, and click on the <<Copy<< button.

9) When finished, quit the Font/DA Mover and restart your computer.

Troubleshooting INIT Conflicts

If you installed any startup documents or control panels, you'll probably see their icons line up across the bottom of the screen when you restart. They load into memory at startup time and modify the standard behavior of the operating system.

If the Macintosh fails to restart or behaves erratically, you probably have an incompatible, or conflicting INIT or control panel. To verify this problem, follow these steps:

1) Shut down the computer.

2) Insert the System Tools (or System StartUp) disk.

3) Restart the computer.

4) Create a new folder on the hard disk and name it "INITs."

5) Open the System Folder on the hard disk, and move to the INITs folder any third-party (that is, non-Apple) INITs you added since completing the clean installation. Choose by Kind from the View menu to help identify files of Kind — "startup document," "control panel" and "Chooser document" — that you need to move.

6) Restart the computer from the hard disk.

7) When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting INIT. Continue with these steps:

8) Move one item from the INITs folder to the closed System Folder and restart the Macintosh.

9) Attempt to recreate the original problem.

Repeat steps 8 and 9 for each item in the new folder on the desktop until the problem recurs. The last item returned to the System Folder is probably the cause of the problem. Restart with the System Tools (System StartUp) disk and remove the problem item from the System Folder. Check with the vendor for compatibility information.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

When the Macintosh behaves as expected, check the Storage folder for items you may not have reinstalled. You may find items including the following:

- INITs, control panels, device drivers (such as scanner drivers), which you should reinstall from the original floppy disks, if possible.

- Application Preference files, which store any changes you made to the application's default settings (for example, if you change the default font in your word processing program). You can drag these settings to the new System Folder, but be aware that Preference files do sometimes become damaged and can cause erratic behavior. If this happens, quit the application, remove the Preference file from the System Folder, and launch the application again. The application recreates the Preference file the next time you launch it, and returns your settings to their defaults.

- Folders installed by applications (such as Claris, Microsoft, and Aldus). You can move these to the new System Folder.

After you move all needed items from the Storage folder, drag the Storage folder to the Trash, and choose Empty Trash from the Special menu.

Apple LaserWriters: Changing the Symbol Set for DOS Print(2/94)

Revised: 2/11/94
Security: Everyone

Apple LaserWriters: Changing the Symbol Set for DOS Print(2/94)

==========

Article Created: 9 February 1994

TOPIC ----------

I would like to print the special German letters (like ä, ü, ö, ß) in DOS, using the software Printer Control Panel that comes with the Windows-marketed Apple LaserWriter printers (LaserWriter Pro 600 and 630, Personal LaserWriter NTR, LaserWriter Select 310 and 360).

DISCUSSION ----------

The Printer Control Panel software that ships with Apple Windows-marketed LaserWriters is simply emulation switching software, so it has no real role in producing the German letters. You can print the letters in different ways depending on which mode you choose for the printer (PostScript or PCL). For this article we'll assume that you're using PCL.

Given this assumption, you can change the symbol set used in PCL mode to one that contains umlaut characters. The ROMAN-8 symbol set, for example, contains the characters you're looking for. We've provided the PCL escape code sequence at the end of this article to perform this.

Of course, you first need to generate the umlaut characters on the screen. The character codes for "ä, ü, ö, ß" in the ROMAN-8 symbol set are 204, 207, 206, and 222 respectively. To generate these on the screen requires some combination of modifier keys (Shift, Option, and so on) to get the characters.

Here's the HP PCL escape code to change the symbol set to ROMAN-8. You should place this at the beginning of your text document:

<esc>(8U

The Printer Control Panel software determines that this is HP PCL and

automatically switches the Apple printer into PCL mode.

LaserWriter Pro 630: PostScript Commands to Change Baud Rate

Revised: 2/11/94
Security: Everyone

LaserWriter Pro 630: PostScript Commands to Change Baud Rate

==========

Article Created: 9 February 1994

TOPIC ----------

How can we change the baud rate for the RS-232 serial port on the LaserWriter Pro 630? We have an SGI Indigo-2 workstation serially connected to the LaserWriter, and we need the appropriate PostScript commands to change the baud rate.

DISCUSSION ----------

Here are the PostScript commands to change the baud rate on the serial 9-pin port.

NOTE: The LaserWriter Pro has four user-configurable communications settings; these are thumbwheel switch positions 6 through 9. Page 126 in the LaserWriter Pro User's Guide outlines all of the default settings for these positions.

To change the baud rate to 9600 for switch position 6 on the serial 9-pin port:

```
%%Begin (%SerialB_NV%) <</Baud 9600>> setdevparams %%End
```

The possible baud rate values are: 300, 600, 1200, 1800, 2400, 3600, 4800, 7200, 9600, 19200, 57600.

The integer after "SerialB_NV" correlates to the thumbwheel switch setting. For example:

```
%SerialB_NV%    - changes settings to thumbwheel switch setting 6
%SerialB_NV2%   - changes settings to thumbwheel switch setting 7
%SerialB_NV3%   - changes settings to thumbwheel switch setting 8
%SerialB_NV4%   - changes settings to thumbwheel switch setting 9
```

Novell Netware: Rebuilding Desktop File (4/97)

Revised: 4/2/97
Security: Everyone

Novell Netware: Rebuilding Desktop File (4/97)

==========

Article Created: 9 February 1994
Article Reviewed/Updated: 02 April 1997

TOPIC -----

Macintosh systems use a Desktop database that contains information associating the documents and applications with icons, and provides bitmap representations of the icons. AppleShare servers, and third-party servers that use AFP (Apple Filing Protocol), implement their own version of a Desktop database, enabling Macintosh users to retain their familiar Macintosh graphical user interface when accessing those server's volumes.

You can rebuild remotely a Novell Netware Desktop file on an AFP volume. This article presents steps for rebuilding the network's Desktop file(s) for Netware versions 3 and 4.

DISCUSSION -----

Netware 3.x

Netware 3.x has 3 hidden files in the Desktop AFP subdirectory that collectively contain the database. Follow these steps to rebuild (clear) the Desktop files:

Step 1
Load AFP. It checks to see if the Desktop files exist, and if not, creates them.

Step 2
Load AFP CDT. CDT stands for Clear Desktop. This clears out the databases. It doesn't eliminate them, but merely clears them out.

Step 3
Rebuild the remote Netware volume. Use a Macintosh client running a version of System 6 system software, or a System 7.x workstation booted with a System 6.x System floppy disk. Hold down the Option key and the Command key (open Apple key) when connecting to that volume.

Step 4
Follow the steps to number 2 above.

Step 5
Mount the Novell volume you wish to rebuild, then launch the Rebuilder utility.

Step 6
A dialog box will appear on your desktop. Highlight the volume you wish to rebuild and click on the Rebuild button. If you wish to rebuild multiple volumes, hold down the <Shift> key, and highlight each volume you want to rebuild then click on the Rebuild button.

Step 7
A status bar will appear on the desktop showing the rebuilding progress. Also a dialog box will appear stating the desktop that has been successfully rebuilt when completed.

Step 8
For the Finder to recognize each new Desktop, you may need to restart or unmount and remount each rebuilt volume.

Netware 4.x

Netware 4.x uses a database Btrieve structure, which the server maintains dynamically. The system automatically checks the database for corruption. If it finds evidence of corruption, the server rebuilds the Desktop database. You can also force a rebuild of the database in a Netware 4.x environment within AFP CON:

Step 1
Load AFP CON.

Step 2
Choose Maintenance and Status option.

Step 3
Choose Volume information.

Step 4
Select your volume from the list.

Step 5
Choose Start Desktop Database Rebuild, Enable AFP, Choose Modified, Cancel Desktop.

Repeat these steps for each server you wish to rebuild.

Article Change History:
02 Apr 1997 - Removed outdated reference to on line service.
16 Oct 1995 - Changed information on getting Dayna Rebuilder utility.
10 Feb 1995 - Added information on where to find Dayna Rebuilder.

A/UX: Does Version 3.0.1 Include Motif? (2/94)

Revised: 2/7/94
Security: Everyone

A/UX: Does Version 3.0.1 Include Motif? (2/94)

==========

Article Created: 7 February 1994

TOPIC -----

Was a version of Motif shipped with A/UX 3.0.1? If not, where can I get a copy of Motif for A/UX?

DISCUSSION -----

Motif has never shipped with A/UX.

Integrated Computer Solutions (ICS), however, developed a version of OSF/Motif (1.1.4, X11R4 based) for A/UX.

According to ICS, however, they have stopped producing this and no longer support for it.

To locate a vendor's name and phone number, use the vendor's name as a search string.

LaserWriter Pro 810: What Are VMS/UNIX Network Utilities? (2/94)

Revised: 2/8/94
Security: Everyone

LaserWriter Pro 810: What Are VMS/UNIX Network Utilities? (2/94)

==========

Article Created: 7 February 1994

TOPIC ----------

What are the LaserWriter Pro 810 VMS Network Utility Installer (Apple part number M2695LL/A) and LaserWriter Pro 810 UNIX Network Utility Installer (Apple part number M2696LL/A)?

DISCUSSION ----------

They are print driver and utility installer kits for the LaserWriter Pro 810. Both of these utilities are also included with the LaserWriter Pro 810 on 3.5-inch floppy diskettes (the UNIX utility is on a tar formatted-diskette and the VMS floppy is on a MS-DOS-formatted diskette).

Apple created these utility kits, because some VMS and UNIX systems require tape-based instead of floppy-based software.

The VMS Network Utility is shipped on a TK50 tape, while the UNIX Network Utility is shipped on a QIC24 tape.

AppleSearch: Changing Index Location On An AWS 95 (2/94)

Revised: 6/17/94
Security: Everyone

AppleSearch: Changing Index Location On An AWS 95 (2/94)

==========

Article Created: 4 February 1994

TOPIC -----

The AppleSearch Server requires a "volume" be selected as a point for indexing on an Apple Workgroup Server (AWS) 95. Under the A/UX operating system, the root file system is the only choice that is presented. The reason for this is that the UNIX operating system "mounts" other file systems as a node on the current file system. For example, an external drive could be mounted as /shared data/software and could contain shared data. The root file system could have only a couple of megabytes free, and a lot on /shared data/software, but since AppleSearch looks for Macintosh style volumes, that being "/" it uses the root file system for indexing. Most UNIX systems have a small root file system and a large data (/shared data) and /usr partitions. This way, the UNIX system can be reinstalled with minimal hassle. Under AppleSearch, this presents a problem, is there a workaround?

DISCUSSION -----

AppleSearch 1.0 forces the "AppleSearch Indexes" folder to be at the root of HFS partition. This is fine for HFS disks, but for the UFS disks there are times when you want to move them (if, for instance, /users is a separate disk and you want the indexes there). Here is a workaround you can use:

1) Start AppleSearch and create the information source indexes in "/".
2) Quit AppleSearch.
3) Move the index to wherever you want them to exist.
4) Restart AppleSearch. It will ask you where the indexes are, navigate to them, and then AppleSearch remembers the new location.
5) Index as usual.

Also, you may want to have fair amount of available space on the "/" directory. AppleSearch uses this directory to store temporary files when reindexing, which can be large at times.

LW Pro 810: Printing Ledger Size at High Resolution (2/94)

Revised: 2/15/94
Security: Everyone

LW Pro 810: Printing Ledger Size at High Resolution (2/94)

==========

Article Created: 15 February 1994

TOPIC ----------

When I try to print ledger-size documents (11 by 17 inches) to my LaserWriter Pro 810, the only output is an 8.5 by 11 inch page with a double line printed across the top. I setup the printer with the Auto Setup option in the Chooser and I'm using LaserWriter driver version 8.1.1.

How can I print ledger-size documents?

DISCUSSION ----------

The LaserWriter Pro 810's standard 8MB of memory can only print ledger-sized pages at a maximum resolution of 400 dots-per-inch (dpi). If the printer is set for 800dpi and you try to print ledger-sized documents, the resulting problem you outlined will occur. To print ledger-sized pages at higher resolution, the printer memory needs to be upgraded to 12MB for 600 dpi and 16MB for 800 dpi.

Here's how to print ledger-sized documents at 400 dpi:

1) Select 400 dpi printer resolution for a particular print job.

   On a Macintosh computer, follow these steps:

   1) Select Print from the File menu to display the Print Dialog box.
   2) Click on Options in the Print Dialog box to display the Print Options Dialog box.
   3) Select 400 dpi from the Choose Resolutions option.

You can permanently change the LaserWriter Pro 810's default printer resolution by selecting the appropriate resolution in the printer's control panel under the POSTSCRIPT RESOLUTION option.

2) Set the paper size for ledger-size paper, then select the specific paper

tray with ledger-sized paper in your printing utilities.

On a Macintosh computer, follow these steps:

1) Select Page Setup from the File menu to display the Page Setup Dialog box.
2) Select Ledger from the Paper option. Click OK to close this dialog box.
3) Select Print from the File menu to display the Print Dialog Box.
4) Select the specific paper tray (Upper, Middle, Lower) that contains ledger-size paper from the Paper Source option.

PowerBook Duo Battery Patch: For Battery Recharge Problem (3/95)

Revised: 3/3/95
Security: Everyone

PowerBook Duo Battery Patch: For Battery Recharge Problem (3/95)

==========

Article Created: 9 February 1994
Article Reviewed/Updated: 03 March 1995

TOPIC ----------

The Read Me file for PowerBook Duo Battery Patch states:

The Duo Battery Patch (extension) has been developed to resolve a problem discovered with PowerBook Duo 210/230/250s using version 1.0 of the PowerBook Duo Enabler.

Apple recommends that all Duo users upgrade to version 1.0 of the PowerBook Duo Enabler. Users of 210's, 230's, or 250's should also install the Duo Battery Patch. Users of 270c's do not need to install this patch.

This patch is being rolled into future versions of Duo enablers. When the next version of the PowerBook Duo Enabler is released, users can feel free to remove this patch from their system.

DISCUSSION ----------

The Read Me should have more clearly stated that the problem only involves:

- Some (not all) PowerBook Duo 210, 230, and 250 computers
- With Express Modems installed
- Using version 1.0 of the PowerBook Duo Enabler.

The problem -- PowerBook Duo battery won't recharge and/or the battery DA shows blank or empty.

Customers running System 7.5 or using the Type III battery will not need this patch. System 7.5 has the patch built in and the Type III batteries do not need it.

Article Change History:
03 Mar 1995 - Noted that System 7.5 users don't need the patch.

LaserWriter Pro 810: How Memory is Allocated (2/94)

Revised: 2/15/94
Security: Everyone

LaserWriter Pro 810: How Memory is Allocated (2/94)

==========

Article Created: 10 February 1994

TOPIC ----------

I have a LaserWriter Pro 810 with 16MB (megabytes) of memory. When I select my printer in the Chooser and click on Printer Info to see how much memory is available, only 1.2MB is free. Note that the LaserWriter Pro 810 has just been turned on and no fonts are downloaded.

How is the rest of the LaserWriter Pro 810 memory allocated?

DISCUSSION ----------

When the LaserWriter Pro 810 powers on, it checks to see how much memory is available and automatically allocates the largest page buffer possible at the highest resolution. Thus, for a 16MB configuration, approximately 14.1MB is used to create a page buffer for a ledger-sized page at 800dpi.

The remaining 1.9MB of memory is used for such things as the PostScript interpreter itself, PostScript dictionaries, display list, font caching, and program memory.

LaserWriter Pro 630: How Memory is Allocated (2/94)

Revised: 2/15/94
Security: Everyone

LaserWriter Pro 630: How Memory is Allocated (2/94)

==========

Article Created: 15 February 1994

TOPIC ----------

I have a LaserWriter Pro 630 printer with 8MB (megabytes) of memory. When I select my printer in the Chooser and click on Printer Info to see how much memory is available, only 2.3MB is free. Note that the LaserWriter Pro 810 has just been turned on and no fonts are downloaded.

What happened to the remaining 5.7MB of memory? How is the rest of my LaserWriter Pro 630's memory allocated?

DISCUSSION ----------

The remaining 5.7MB of memory is used for a variety of things, although most of it is allocated to a frame buffer where the actual page is imaged.

Since legal-size (8.5 by 14 inches) is the largest available page size, the memory required for a legal-sized page can be calculated by multiplying the total imageable area (8.5 by 14) by the highest vertical and horizontal resolution in dots-per-inch (600 by 600). This calculation comes out to roughly 5MB.

The 2.3MB of "free" memory is used for such things as the PostScript interpreter itself, PostScript dictionaries, display list, font caching, and program memory.

LaserWriter Pro 810: Printing from UNIX Default Socket (2/94)

Revised: 2/15/94
Security: Everyone

LaserWriter Pro 810: Printing from UNIX Default Socket (2/94)

==========

Article Created: 15 February 1994

TOPIC ----------

I have been using TCP port 3101 (Factory printer with no settings) to print from UNIX platforms (Macintosh and Sun) to a LaserWriter Pro 810. A few days ago, TCP port 3101 would suddenly no longer print documents sent to it, though the printer acts like the documents are printed.

Are there any internal settings in the LaserWriter Pro 810 that are not reset to factory defaults by selecting "Restore Factory Setup" from the printer's LCD front panel? If so, how can they be reset and could they cause this problem?

DISCUSSION ----------

Yes, there are settings not affected by the "Restore Factory Setup" option in the LaserWriter Pro 810's control panel. This option only affects settings used by the PostScript interpreter. Settings for the LaserWriter Pro 810's print server (otherwise known as Virtual Printer Technology) are kept on the print server card itself which is inside the printer. It has its own separate Non-Volatile RAM (NVRAM). These settings can be reset in two different ways:

1) By entering the command "INIT DEFAULT DELAY 0" through the printer's Remote Console Facility (RCF).

2) By putting a jumper on "WIRE 2" on the print server card, starting up the printer until "Ready To Print" appears, and then removing the jumper.

WARNING: Either one of these reset mechanisms will remove all virtual printers, and any settings related to virtual printers.

Here are some suggestions which may cure your problems in printing from the UNIX default socket:

1) Reset the LaserWriter Pro 810's print server as mentioned above.

2) Through your printer's RCF, type in "show service characteristics" and look to see that CONNECTIONS and QUEUE are "enabled" in TCP port 3101. If they aren't, enabling them should cure your problem.

3) Print to a different TCP port, such as 3104 for ASCII printing or 3102 for PostScript printing.

LW Pro 810: Non-AppleTalk Packets in Data Stream (11/94)

Revised: 11/9/94
Security: Everyone

LW Pro 810: Non-AppleTalk Packets in Data Stream (11/94)

==========

Article Created: 15 February 1994
Article Reviewed/Updated: 9 November 1994

TOPIC ----------

When I used a network diagnostic tool on my network, I noticed that a variety of non-AppleTalk packets are being sent from my LaserWriter Pro 810. How do I turn each one off or on?

DISCUSSION ----------

If you plan on using the RCF (Remote Console Facility) extensively you should order the manual "Apple LaserWriter Pro 810 TCP/IP - LAT Protocol and Command Reference" (Apple Part Number M2187LL/A).

RCF can be accessed a couple of different ways. The easiest is by Telnet, once the printer's IP address has been set. The other way is by using the RJ-12 maintenance port. This option requires a unique RJ-12 to mini DIN-8 cable. For further information on the maintenance port and cabling, refer to Section 2.3.2 and Appendix A of Part 1 in the LaserWriter Pro 810 Network Installation and Configuration Manual. Once the connections have been made, the default passwords for RCF are as follows:

RCF: password = ACCESS
RCF Super User mode: password = SYSTEM

Enable or Disable a Protocol Stack

Below is listed the RCF commands you can use to enable or disable the entire protocol stack. Use these commands to specify server options:

SET SERVER option(s)
DEFINE
CHANGE

Option: AUTHORIZED [PROTOCOL] APPLETALK [ENABLED | DISABLED]

```
                                LAT       [ENABLED | DISABLED]
                                NETWARE   [ENABLED | DISABLED]
                                TCPIP     [ENABLED | DISABLED]
                                ALL
                                NONE
```

Below is an example showing the disabling of TCP/IP:

```
  change server authorized tcpip disabled
```

Specifying a protocol with no flag, enables that protocol and disables the rest. ALL enables all protocols. NONE disables them.

SET — Modifies the current database and takes effect immediately. Parameters are reset to permanent (DEFINEd or CHANGEd) values at the next login or initialization

DEFINE — Modifies the permanent database and takes effect next login or initialization.

CHANGE — Modifies both databases immediately.

Enable or Disable Announcement Broadcasts

Announcement broadcasts may also populate the network such as DECnet MOP (Maintenance Operation Protocol) or bootp in TCP/IP. Use this command to specify server options.

```
   SET    SERVER option(s)
   DEFINE
   CHANGE
```

```
Option: ANNOUNCEMENTS [PROTOCOL] LAT   [ENABLED | DISABLED]
                                 TCPIP [ENABLED | DISABLED]
                                 RCF   [ENABLED | DISABLED]
```

Note: RCF enables or disables DECnet Mop.

Below is an example showing how to disable the DECnet MOP broadcasts:

```
  change server announcements rcf disabled
```

SET — Modifies the current database and takes effect immediately. Parameters are reset to permanent (DEFINEd or CHANGEd) values at the next login or initialization

DEFINE — Modifies the permanent database and takes effect next login or initialization.

CHANGE — Modifies both databases immediately.

Enable or Disable Netware Broadcasts

Netware broadcasts are different, use this command to specify the preferred Ethernet mode that IPX uses.

```
 SET     SERVER NETWARE IPX [DEFAULT | 802.3 | [ETHERNET_II [ether_type]]]
 DEFINE                     [REDISCOVER [minutes]]
 CHANGE                     [FAST [PRINTSERVER] ENABLE | DISABLE]
```

Below is an example showing how to disable Netware broadcasts:

```
  change server netware ipx rediscover 0
```

DEFAULT	IPX will try both 802.3 and Ethernet II. The first one found will be selected.
802.3	IPX will only look for 802.3 Ethernet frames.
ETHERNET_II	IPX will only look for Ethernet II frames.
ether_type	If Ethernet II is selected the user can specify the Ethernet type in ASCII hex. For example, the Netware default is 0x8137. The Ethernet type is not changed if this is not specified.
REDISCOVER	Triggers the rediscovery process. This process queries the network for newly configured Novell Print Servers and starts all remote printers found.
minutes	If specified with the REDISCOVER keyword this sets the automatic interval at which REDISCOVERY takes place. The range is from 0-14 minutes, 2 is the default and 0 disables periodic rediscovery.
FAST	Some versions of Netware pserver when run on original PC class machines (4.77mhz) require this option to be disabled.

Newton MessagePad: Hard Resets Occur After Low Power (3/94)

Revised: 3/18/94
Security: Everyone

Newton MessagePad: Hard Resets Occur After Low Power (3/94)

==========

Article Created: 18 March 1994

TOPIC ----------

When I turn on my Newton MessagePad, I get the message "Do you want to erase data?". What is causing this to happen?

DISCUSSION ----------

The message is an indication that a hard reset has occurred. A hard reset erases only the information you have stored. It does not remove Newton's programs or operating system software (including system updates).

The normal procedure for doing a hard reset is to slide down the on/off switch, hold it down as you press the Reset button in the battery compartment, and then release the on/off switch.

There are also two unusual situations that can trigger a hard reset. If the Newton MessagePad is low on power, then a power fault flag is set. Once this flag is set, if the power switch is held for an extended duration, a hard reset is triggered. If the Newton MessagePad quits and resets itself, and the power switch is held down, a hard reset is also triggered.

No changes will be made to the software or hardware to eliminate this from occurring.

ARA 2.0: Incompatible with Macintosh Plus (5/96)

Revised: 5/24/96
Security: Everyone

ARA 2.0: Incompatible with Macintosh Plus (5/96)

==========

Article Created: 11 February 1994
Article Reviewed/Updated: 24 May 1996

TOPIC ----------

I'm using a Macintosh Plus, Hayes V-series 9600, AppleTalk Remote Access (ARA) 2.0 and supplied script. ARA won't dial. AppleTalk Remote Access 1.0 worked on this Macintosh Plus.

DISCUSSION ----------

ARA 2.0 is incompatible with Macintosh Plus computers. Version 2.0.1 is compatible, and can be ordered through the Apple Order Center. There is a small charge for shipping and handling. The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

Article Change History:
24 May 1996 - Updated for technical accuracy.
25 May 1994 - Added 2.0.1 availability information.
11 Apr 1994 - Added the note about ARA 2.0.1 beta software.

VideoSync: Doesn't Run with Some Configurations (5/95)

Revised: 5/25/95
Security: Everyone

VideoSync: Doesn't Run with Some Configurations (5/95)

==========

Article Created: 11 February 1994
Article Reviewed/Updated: 25 May 1995

TOPIC ----------

I am using VideoSync, and followed all the directions. They explain that I needed to put VideoSync and the Monitors control panel at the root level of the System Folder, and put an alias of the Monitors control panel in the Control Panels folder. Then restarted my Macintosh computer.

Configuration:

System 7.1
VideoSync 1.0

Quadra 700
Apple 21-inch
Apple 8.24 GC video card

When I open the Monitors control panel and click on Options, the screen goes into a severe roll and I have to restart.

DISCUSSION ----------

This configuration won't work with VideoSync.

VideoSync will only run:

- In 8-bit color (256 colors)
- Only on a 13-inch monitor (640x480)
- Only on the 8•24 NuBus card

VideoSync WON'T RUN with:

- The 24AC Display card
- The 8•24 GC card

- Third-party cards
- Internal Video

You need to use a smaller monitor and a different card to make VideoSync work on the Quadra 700. If you had access to a Quadra 840AV, you could use VideoSync II which ONLY works on the Internal Video.

Both VideoSync and VideoSync II are available through online services Apple provides software updates on.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates

- Obtaining Apple Product Support in the USA
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Article Change History:
25 May 1995 - Added where to get VideoSync & VideoSync II software

Software Installation Over a Network (2/95)

Revised: 2/10/95
Security: Everyone

Software Installation Over a Network (2/95)

==========

Article Created: 11 February 1994
Article Reviewed/Updated: 10 February 1995

TOPIC ----------

This article tells you how to set up software on a file server for installation over a network. This process works with many software packages that use the Apple Installer, such as At Ease and System 7, but does not work for system software versions earlier than 7.0.

DISCUSSION ----------

NETWORK INSTALLATION SERVER SETUP
==========

Most software installation scripts, especially those that use the Apple Installer, specify the name and contents of each disk used in the installation. You can substitute folders for disks, as long as their names and contents are exactly the same as the disks.

To set up a network installation, you need to have write privileges on the file server. If you cannot create files on the file server, ask your file server administrator to grant write privileges, then follow these steps:

Step 1:
Create a folder on a server volume, and give it an appropriate name, such as "System 7 Net Install".

Step 2:
Insert the first installation disk and drag its icon to this new Net Install folder. All files on the disk will copy into the new folder. Repeat this process for the remaining installation disks, except the Disk Tools disk.

Step 3:
Double-click the Net Install folder to open it.

Step 4:
Find the folder with the name of the first installation disk and open it.

Step 5:
Drag the Installer icon and the Installer Script icon to the root (top) level of the Net Install folder.

NOTE: If you are setting up a network installation for System 7 Pro, the instructions differ slightly from previous versions of system software. Make these changes:

- The Installer and Installer Script remain inside the Install Me First folder.

- Create an alias to the Installer and the Installer Script, and drag the aliases to the top level of the Net Install folder.

Step 6:
Be sure the server users have privileges to "See Folders" and "See Files" for the Net install Folder and all enclosed folders. Ask your file server administrator for help, if necessary.

Step 7:
Test the server by logging on from your own computer and running the installation.

NETWORK INSTALLATION

Preinstallation Checklist

Have a Recent Backup

It is always advisable to have a recent backup of your hard disk data. There are several software utilities available that perform this operation, or you can select the items you want to back up, and then copy them to another disk. If you cannot back up your entire hard disk, at least make a backup copy of your System Folder.

Run a Compatibility Checker

If you are installing system software, you may have a Compatibility Checker with the package. If so, run it before installing the new software. It checks all your applications and extensions for compatibility, and lets you print out the report. Remove any incompatible or questionable extensions from your System Folder. Contact the vendors of the incompatible applications for update information.

Turn Off Security and Virus-Protection Software

Turn off all security software and virus-protection software, and restart. Refer

to the manuals that came with the software for instructions.

Check for Directory Problems

Before upgrading system software, it is advisable to check the disk for directory problems. Start the workstation with the Disk Tools disk, and Run Disk First Aid on all connected hard disks. Repair any damaged hard disks you have connected to your Macintosh.

Update Hard Disk Drivers

You may want to update hard disk drivers, especially if you are upgrading from System 6 to System 7. If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that is on the Disk Tools disk. Start the Macintosh with the Disk Tools disk, open Apple HD SC Setup, and click on the Update button.

If HD SC Setup cannot update the hard disk driver (indicated by a "dimmed" Update button), consider these possibilities:

- If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard disk.

- If a version of Apple HD SC Setup more recent than the version on the Disk Tools disk formatted your hard disk, do not update the hard disk drivers.

- If a System 6 version of Apple HD SC Setup formatted the drive, it may not have left enough room for the updated driver. You don't have to update the hard disk drivers. However, if you intend to use file sharing or have a Macintosh that can use virtual memory, then you need to back up the disk and re-initialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver is corrupt, the Macintosh does not recognize the disk (that is, the disk does not show on the desktop when you start from a floppy disk). You may want to re-initialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver has been modified with compression or security software you will not be able to update the driver. Contact the vendor for additional help.

Begin Installation

Step 1:
Connect to the shared disk that contains the Net Install folder.

Step 2:
Double-click the Net Install folder to open it. A window appears.

Step 3:
Double-click the Installer icon (or alias, if you're using System 7 Pro).

Follow the instructions under Easy Install or Customize Install.

Easy Install

Step 1:
Click the Switch Disk button to select the disk where you want to install system software.

Step 2:
Click the Install button. When installation finishes, a message appears saying installation was successful.

Step 3:
Click the Quit Button.

Step 4:
Choose Restart from the Special menu.

Customize Install

If you want to select the components of the software installed (for example, if you do not want to install file sharing software, or don't want all printer drivers installed), you can customize the installation.

Step 1:
In the Installer, click the Customize button. A screen appears.

Step 2:
Click the Switch Disk button if necessary to select the disk where you want to install system software.

Step 3:
Select the items you want to install. Shift-click to select multiple items. Your selections appear beneath the scrolling window.

Step 4:
When you've made your selections, click the Install button.

Step 5:
When installation finishes, a message appears saying installation was successful. Click the Quit button.

Local Volume "Network Installation"
==========

This procedure also works on a local volume, such as an external hard disk or a RAM disk. This is useful for a Macintosh with only an 800K floppy drive, when you have high-density installation disks. Follow these steps:

Step 1:
Attach an external hard disk to a Macintosh with an Apple SuperDrive (formerly called FDHD).

Step 2:
Set up the Net Install folders on the external drive.

Step 3:
Connect it to the Macintosh with the 800K floppy drive.

Step 4: Run the Installer.

Clean System Software Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It's also useful in troubleshooting.

Follow these steps to do a clean system software installation over the network:

Step 1:
Follow the previous instructions in this document about the Compatibility Checker and Disk First Aid, updating the hard disk drivers if needed, and disabling security and virus protection software.

Step 2:
Log on to the file server where the Net Install folder is.

Step 3:
Open the System Folder on your hard disk.

Step 4:
Drag the System (at the root level of the System Folder) into the Preferences Folder.

Step 5:
Close the System Folder, and rename it "Storage".

Step 6:
Proceed with the installation instructions in the Begin Installation section.

After performing a clean installation, verify that problems are resolved before adding anything to the new System Folder. Adding items to the System Folder before resolving the problem defeats the purpose of a clean installation.

When the Macintosh behaves as expected, check the Storage folder for other system files, fonts, and sounds that you may want to install in your new System Folder. Drag files to the Trash that duplicate those in your new System Folder. Other files you might find in the Storage Folder include:

- INITs, control panels, and device drivers (such as scanner drivers), which you should reinstall from the original floppy disks, if possible.

- Check the system suitcase for non-standard fonts, sounds, and keyboard layouts.

- Preference files from applications that store information about the application's settings, (such as the default font and margins). These files can sometimes become damaged -- unless you have spent a lot of time customizing the application, it is best not to reinstall these. The application recreates the Preference file with default settings when you launch it.

- Some applications install folders (such as Claris, Microsoft, Aldus, or a folder for electronic mail). You can drag these folders to the new System Folder.

After you move all needed items from the Storage folder, drag the Storage folder to the Trash, and choose Empty Trash from the Special menu.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
10 Feb 1995 - Added keyword; made several technical updates; reformatted.
08 Feb 1995 - Added information on compressed drivers.
27 Oct 1994 - Review for consistency and update format.

Sys 7.1 CD: Clean Install Quadra/Centris 610, 650, 800 (7/96)

Revised: 7/8/96
Security: Everyone

Sys 7.1 CD: Clean Install Quadra/Centris 610, 650, 800 (7/96)

==========

Article Created: 14 February 1994
Article Reviewed/Updated: 2 July 1996

TOPIC

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It's also useful in troubleshooting.

DISCUSSION

Follow these instructions in the order presented.

Restart with Install Me First CD

1) Shut down your Macintosh computer.

2) Restart the computer while holding down the Command-Option-Shift-Delete keys.

3) When you see the blinking question mark, continue holding down the four keys, and insert the CD into the drive.

   The computer should start from the CD, and then you should see the At Ease menu. If you don't see this menu, repeat these steps.

Run Disk First Aid

Disk First Aid software can detect and repair problems on a hard disk.

1) Click on the Disk First Aid button.

2) In the window that appears, be sure the startup hard disk is selected. If it isn't, click the Drive button to select the startup hard drive.

3) Click on Open and then on Start. Disk First Aid checks your hard disk for any potential problems. If it finds problems, you should let the software repair them.

4) Repeat this procedure for each hard disk attached to the system.

5) When you're finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid can't repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that disk. For Apple drives, use Apple HD SC Setup.

Update Hard Disk Drivers

If you don't have an Apple hard disk or use third-party software to format your disk, don't use the Apple HD SC Setup Utility. However, you should contact your hard drive vendor to verify that your formatting software is compatible with system software version 7.1.

If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that's on the Disk Tools disk, following these steps:

1) Double-click the HD SC Setup icon to launch it.

2) Click on the Update button.

3) When you're finished, click Quit to return to the Finder.

If HD SC Setup can't update the hard disk driver (indicated by a "dimmed" Update button), consider these possibilities:

- If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard disk.

- If a version of Apple HD SC Setup more recent than the version on the Disk Tools disk formatted your hard disk, don't update the hard disk drivers.

- If a System 6 version of Apple HD SC Setup formatted the drive, it may not have left enough room for the updated driver. You don't have to update the hard disk drivers. However, if you intend to use file sharing or have a Macintosh that can use virtual memory, then you need to back up the disk and reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver is corrupt, the Macintosh doesn't recognize the drive (that is, the drive doesn't show on the desktop). You may wish to reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver has been modified with compression or security software you will not be able to update the driver. Contact the vendor for additional help.

Check Available Hard Disk Space

Be sure you have at least 5MB available on the hard disk where you plan to install the system software. To check hard disk space, follow these steps:

1) Choose Control Panels from the Apple menu.

2) Double-click the Views control panel to open it.

3) In the Views control panel, check "Show disk info in header."

4) Open your hard disk's window.

The amount of available disk space appears in the upper-right corner of any open window.

If there's less than 5MB available, you'll need to delete some unnecessary files by moving them to the Trash. Choose Empty Trash from the Special menu, and you'll have more disk space available. Or you can copy files onto floppy disks or other media before moving them to the Trash.

Disable the System Folder

You disable the System Folder by moving the System and renaming the System Folder.

1) Open your hard disk's icon and locate the System Folder.

2) Open the System Folder and locate the System file.

3) Move the System file into the Preferences folder.

4) Close the System Folder's window and rename the System Folder "Storage."

5) Close all windows that are open on your desktop.

Install System 7.1

Install system software version 7.1 following these steps:

1) Double-click on the Install System Software icon located on the

Install Me First CD.

2) When the "Welcome to the Apple Installer" message appears, click on OK.

3) Be sure the correct disk is selected for the installation procedure (click on "Switch Disk" if necessary).

4) Click on Install.

The Installer determines the required software and reads it from the CD.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks aren't available, you may move the non-standard items from the Storage folder to the new System Folder. Be aware that reinstalling items from the old Storage folder into the new System Folder may reintroduce damaged or corrupted files. Be careful not to replace anything that's already in the new System Folder. Only move items that aren't already in the new System Folder.

1) Open each corresponding folder within the System Folder and the Storage folder and then compare the contents.

2) Move anything that isn't already in the new System Folder and its subfolders from the Storage folder and its subfolders to the new System Folder.

3) Restart your Macintosh.

Troubleshooting Extension Conflicts

If you've installed any system extensions or control panels, you'll probably see their icons line up across the bottom of the screen when you restart. They load into memory at startup time and modify the standard behavior of the operating system.

Verify INIT Conflict

If the Macintosh fails to restart or behaves erratically, you probably

have an incompatible, or conflicting, INIT (also known as a system extension or control panel). To verify this problem, follow these steps:

1) Be sure the Caps Lock key is off.

2) Restart, and after you see the picture of a smiling Macintosh, hold down the Shift key.

3) Release the Shift key when the "Welcome to Macintosh, Extensions Off" message appears.

4) When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting extension or control panel. Continue with the next section.

Remove and Replace INITs in System Folder
---
1) Create a new folder on the desktop and name it "INITs."

2) Open the System Folder, Extensions folder, and Control Panels folder, and choose by Kind from the View menu. Find all items of Kind "system extension" or "control panel" under the Kind heading in the windows of the open folders, and move them to the INITs folder.

3) Close the System Folder, and restart the Macintosh.

4) Attempt to recreate the problem.

5) Move one item from the INITs folder to the closed System Folder and restart the Macintosh.

6) Attempt to recreate the original problem.

Repeat steps 5 and 6 for each item in the INITs folder on the desktop until the problem recurs. The last item returned to the System Folder is probably the cause of the problem. Remove it from the System Folder (restart, holding down the Shift key again, if necessary), and contact the developer of the INIT for more information.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

When the Macintosh behaves as expected, drag the Storage folder to the Trash, and choose Empty Trash from the Special menu.

MODE32: How to Access More Than 8 Megabytes (2/94)

Revised: 2/14/94
Security: Everyone

MODE32: How to Access More Than 8 Megabytes (2/94)

==========

Article Created: 14 February 1993

TOPIC ----------

I have a Macintosh which has 24-bit ROMs and I wanted to access more than 8 megabytes of memory with System 7, so I installed MODE32. When I open About This Macintosh in the Apple Menu, my system size is larger than 8 megabytes, yet I cannot access more than 8 megabytes of memory.

How can I access more than 8 megabytes?

DISCUSSION ----------

Your Macintosh is still set to 24-bit memory addressing and cannot access more than 8 megabytes. You must set your Macintosh to 32-bit addressing. To do so, follow these steps:

1) Select Control Panels from the Apple Menu, then select the Memory Control Panel.

2) Click on 32-bit addressing in the Memory Control Panel.

3) Restart your Macintosh.

Your Macintosh will now be able to access more than 8 megabytes of memory.

MODE32: System Crashes and Recovery (2/94)

Revised: 2/14/94
Security: Everyone

MODE32: System Crashes and Recovery (2/94)

==========

Article Created: 14 February 1994

TOPIC ----------

I am using MODE32 and have had my system "crash" or "freeze." How do I recover from this?

DISCUSSION ----------

Here are some troubleshooting steps to follow if you have system "crashes" or "freezes" when using MODE32:

- If your Macintosh "freezes" before the Welcome to Macintosh dialog box is displayed, additional hardware, such as NuBus cards, system accelerators or memory may not be 32-bit clean. In this case, contact the manufacturer of your third-party hardware.

- If your Macintosh "freezes" when the Welcome to Macintosh dialog box is displayed, your hard disk formatting software may not be 32-bit clean. You should update your hard disk driver.

- If your Macintosh "freezes" while it is loading INIT files, remove all INITs except MODE32, then reboot your system. If your system reboots normally, add the INIT files one by one to your System Folder and reboot after you add each one. If your Macintosh "freezes" again, the INIT that you just added is likely to be incompatible. Contact the INITs vendor to get an updated version.

  Note that INITs that are NOT 32-bit clean are likely to be incompatible.

Newton MessagePad: How to get System Update 1.05 (2/94)

Revised: 2/28/94
Security: Everyone

Newton MessagePad: How to get System Update 1.05 (2/94)

==========

Article Created: 24 January 1994

TOPIC -----

This article describes Newton System Update 1.05.

DISCUSSION -----

Newton System Update 1.05 is designed for any Newton MessagePad who has system software version 1.04 or lower. It optimizes system performance for third-party applications, and improves your Newton's memory and power management. System Update 1.05 gives you the same functionality provided by Newton System 1.11.

To receive System Update 1.05 in the United States, contact the Newton Fulfillment Center at 1-800-242-3374. Outside the United States, contact your local Apple Authorized Service Provider.

Apple is currently distributing system updates for your Newton MessagePad by the following methods:

- If you have the Newton Connection Kit for Macintosh or Windows, you can:

  1) Call the Newton Fulfillment Center at 1-800-242-3374 and order a floppy disk containing the system update. You can then use your Newton Connection Kit to download the system update from your personal computer to your Newton.

  2) For customers with a personal computer, modem, and a Newton Connection Kit for Macintosh or Windows, the update is also available on the following online services:

     Compuserve (type go newton to get to the Newton Forum) America Online (keyword PDA to get to the Newton Discussion Area) AppleLink (in Newton Folder, inside World of Newton)

It is also available to internet users via FTP at the address FTP.APPLE.COM.

- If you do not have the Newton Connection Kit, you can call the Newton Fulfillment Center at 1-800-242-3374 and order the system update on a PCMCIA card. You can then transfer the system update from the PCMCIA card to your Newton.

Since System Update 1.05 uses an additional 32K of system memory, you must back up your Newton's information on a PCMCIA card or with the Newton Connection Kit before installing System Update 1.05. If you do not have a Newton Connection Kit or a memory card, contact the Newton Fufillment Center to borrow a memory card.

Network Software Installer 1.4.x and Enabler 201 Flaw (2/94)

Revised: 2/18/94
Security: Everyone

Network Software Installer 1.4.x and Enabler 201 Flaw (2/94)

==========

Article Created: 14 February 1994

TOPIC -----

This article describes a message flaw with the Network Software Installer (NSI) 1.4.x.

DISCUSSION -----

The NSI 1.3.2 installer had a problem where it didn't remove Enabler 201 from systems that did not require it. This was fixed in later releases of NSI.

However, the NSI 1.4.x installer does install this Enabler on all systems initially because it is unable to handle Enabler files in an elegant manner. So to properly install network resources on Macintosh Duo systems, it is necessary to install Enabler 201 on all systems and then later delete the enabler during the install process on non-Macintosh Duo systems. The Installer does not have a feature that would allow the script writer to hide the message "building file, system enabler 201". As of this writing, the message is there to stay. Engineering is aware of the issue and, when possible, will address it.

Apple Color StyleWriter Pro: Description (7/95)

Revised: 7/27/95
Security: Everyone

Apple Color StyleWriter Pro: Description (7/95)

==========

Article Created: 16 February 1994
Article Reviewed/Updated: 27 July 1995

TOPIC ----------

This article describes the Apple Color StyleWriter Pro printer.

DISCUSSION ----------

The Apple Color StyleWriter Pro printer offers high-quality color documents at an affordable price on a wide range of media sizes and types.

The Apple Color StyleWriter Pro printer is integrated with ColorSync color–matching software. At 360 dots-per-inch (dpi) print resolution, the Apple Color StyleWriter Pro printer offers 44 percent higher resolution than traditional 300-dpi printers.

Setup, use, and maintenance are simple. There is a separate cartridge for black ink, as well as for cyan, magenta, and yellow. So you can print with high–quality black ink and replace cartridges individually.

The Apple Color StyleWriter Pro printer features the ColorShare driver that gives you the ability to share printers across a network. It comes with 64 TrueType fonts and supports Adobe Type 1 fonts when used in conjunction with Adobe Type Manager (ATM).

Product Features

Outstanding Print Quality

- Offers 360 dpi resolution for crisp text and vibrant color
- 65 screen lines per inch
- Takes advantage of ColorSync color-matching technology to ensure high-quality printed output

High Performance

- Prints quickly — even when printing in color
- Offers a variety of print modes to enhance productivity
- Features fast ColorSync performance

Low Cost per Page

- Uses separate cyan, magenta, yellow and black ink cartridges, which lowers cartridge replacement and per-printed-page costs
- Prints on plain bond or copier paper

Convenience

- Features a compact, attractive design
- Includes everything needed to print: interface cable, ink cartridges, printhead, and sample media kit
- Offers the option of printing on a wide range of media, including plain paper, transparencies, premium coated paper, and back-print film
- Takes advantage of ColorShare software to enable printer sharing over a network
- Complies with the EPA's Energy Star guidelines for energy-efficient operation

Ordering Information

Apple Color StyleWriter Pro: Specifications (7/95)

==========

Article Created: 16 February 1994
Article Reviewed/Updated: 14 July 1995

TOPIC ----------

This article gives the technical specifications for the Apple Color StyleWriter Pro printer.

DISCUSSION ----------

Print Method

• Thermal ink jet

Print Quality

• 360 dpi in normal and best mode
• 180 dpi in draft mode

Interface

• High-speed serial (RS-422)

Speed

• Up to 2 pages per minute for monochrome
• Up to 0.5 page per minutes for color
• Actual speed depends on the documents printed and the Macintosh used

Fonts Supported

• 64 TrueType fonts: ITC Avant Garde, ITC Bookman, Chicago, Courier, Delphian, ITC Garamond Narrow, Geneva, Helvetica, Helvetica Black, Helvetica Compressed, Helvetica Narrow, ITC Lubalin Graph, Lucida Bright, ITC Machine, Monaco, Nadianne, New Century Schoolbook, New York, Old English Text, Onyx, Oxford, Palatino, Swing, Symbol, Times, ITC Zapf Chancery, ITC Zapf

Dingbats, and Zeal

Ink Cartridges

- Separate cartridges for cyan, magenta, yellow, and black
- 315 pages at 5% page coverage per color

Print Materials

- 16 to 24 lb. (60 to 90 g/m2) bond or copier paper
- Paper: U.S. letter, U.S. legal, A4, and envelopes (#10 business, monarch, and other sizes)
- Most letterhead and colored stock, labels, and envelopes
- For superior graphics and imaging results, Apple recommends Apple premium coated paper and Apple back-print media
- For fast dry time and vibrant colors, Apple recommends Apple color ink-jet transparencies

Paper Capacity

- Multipurpose tray that accommodates up to 100 sheets of paper or 15 envelopes

Printable Surface

- Maximum printable line: 8.0 in (20.3 cm)
- Minimum margins: 0.25 in. (.64 cm)

Size and Weight

- Height: 7.2 in. (18.3 cm)
- Width: 16.5 in. (41.9 cm)
- Depth: 10.1 in. (25.7 cm)
- Weight: 11 lb. (5.0 kg)

Power Consumption

- Operating mode: 28 W (maximum)

Operating Environment

- Temperature: 59° F to 86° F (15° C to 30° C)
- Humidity: 10% to 80% noncondensing

Power Requirements

- U.S./Japan: 120 V, 60 Hz, 1 amp
- Europe/Australia: 220 to 240 V, 50 Hz, 0.5 amp

System Requirements

- Any Apple Macintosh personal computer that supports Color QuickDraw and has 4MB of RAM and a hard disk drive. Color QuickDraw first shipped with the

Macintosh II, and is in every Macintosh II class computer, which includes the SE/30. This EXCLUDES the Plus, Classic, SE, Macintosh Portable, and the PowerBook 100 (they will not print in color).

- System software version 7.0 or later

Article Change History:
14 Jul 1995 - Added PowerBook 100 and Portable to list of unsupported computers
15 Jun 1994 - Added that only machines that support Color QuickDraw will print in color.

QuickTake 100 for Macintosh: Description (2/94)

Revised: 5/13/94
Security: Everyone

QuickTake 100 for Macintosh: Description (2/94)

==========

Article Created: 17 February 1994

TOPIC -----

This article describes the Apple QuickTake 100 Digital Camera for Macintosh.

DISCUSSION -----

Overview

The Apple QuickTake 100 Digital Camera for Macintosh is a 24-bit color still digital video camera. You can take up to 32 standard-resolution or 8 high-resolution images at a time (which are stored in the QuickTake 100's internal memory), then you can download your images into a Macintosh computer. The Apple QuickTake 100 has automatic exposure and flash, along with simple controls for ease of use.

Once you've connected your QuickTake 100 to your Macintosh with the included serial cable, you can use the QuickTake software to download your images. You can also control and run the camera from your Macintosh, so images appear on screen as they are taken.

Your downloaded images can be rotated, cropped or scaled, then saved in PICT, TIFF or QuickTake file formats for placing in word processing, presentation or publishing applications.

Quality

• High-quality, 24-bit color images
• Two image sizes:
  - 320 by 240 pixels (standard resolution)
  - 640 by 480 pixels (high resolution)

Performance

- Up to 32 standard-resolution or 8 high-resolution images in internal memory
- Automatic exposure with computer-controlledshutter speeds from 1/30 to 1/175 of a second
- Apertures from f2.8 to f16
- Focus range from 4 feet to infinity
- Built-in automatic flash
- Images can be stored in the camera up to one year before being loaded into your Macintosh computer
- Battery life: 120 images (assuming about half taken with flash)

Compatibility

- GeoPort serial connection for high-speed data transfer
- QuickTake application to download and manipulate images
- File formats: PICT, TIFF, and QuickTake
- QuickTake Setup control panel to mount camer as a volume on your Macintosh desktop
- Supports QuickTime system extension for image compression
- ColorSync system extension for automatic color matching to screen and printer
- Standard photo tripod socket
- Standard AA batteries

Ordering Information

Apple QuickTake 100 Digital Camera for Macintosh
Order No. M1644

- QuickTake 100 digital camera for Macintosh
- QuickTake software (for downloading and editing images) for Macintosh
- Serial cable for connecting camera to your computer (cable connects to printer or modem port)
- Three rechargeable NiCad AA batteries
- Battery recharger
- Neck strap
- QuickTake 100 User’s Guide

Battery Booster Pack
Order No. M2655

- Lets you take thousands of pictures with your QuickTake 100 digital camera
- Eight AA lithium batteries included

Travel Case
Order No. M2848

- Leather camera grip and protective carrying case

Macintosh PowerBook AC Adapter
Order No. M4662

- Lets you power your QuickTake 100 digital camera using AC power

Connection Kit for Windows
Order No. M1647

- Allows you to connect your QuickTake digital camera to a Windows-based personal computer

QuickTake 100 for Macintosh: Specifications (10/94)

Revised: 10/17/94
Security: Everyone

QuickTake 100 for Macintosh: Specifications (10/94)

==========

Article Created: 16 February 1994
Article Reviewed/Updated: 17 October 1994

TOPIC ----------

This article describes the specifications of the Apple QuickTake 100 Digital Camera for Macintosh.

DISCUSSION ----------

Image

• 24-bit color

Memory

• 1MB of FLASH EPROM stores up to 32 standard-resolution images, 8 high-resolution images or a combination of high and standard-resolution images
• Storage time: up to one year

Resolution

• 320 by 240 pixels (standard resolution)
• 640 by 480 pixels (high resolution)

Optics

• Fixed-focus lens
• Focus range: 4 feet to infinity
• Field of view: equivalent to a 50-mm lens on a 35-mm camera
• Optical viewfinder
• Aperture from f2.8 to f16

Speed

- Shutter speed: from 1/30 to 1/175 of a second
- Cycle time: average 4 seconds
- Self-timer: 10 seconds

Built-in Flash

- Three modes: Automatic, On, or Off
- Range 4 to 9 feet
- Flash cycle time: 7 seconds

Power

- Includes three rechargeable AA NiCad batteries
- Supports three 1.5 V AA, R6P, LR-6, or SUM-3 NiCad or lithium batteries
- Battery recharger
- Option AC adapter

Interface

- Serial port for connection to Macintosh printer or modem port

User Controls

- Shutter release, resolution, flash, self-timer, and Erase All Images

LCD Status Window

- Number of images that have been taken
- Number of images remaining
- Resolution, flash, and self-timer settings
- Erase All Images
- Battery level

Operating Environment

- Operating - 0° to 40° C (32° to 104° F)
- Storage (6 months) - -40° to 47° C (-40° to 117° F)
- Transit (72 hours) - -40° to 65° C (-40° to 149° F)
- Humidity - 20 to 95 percent, non–condensing
- Altitude - No limitation other than specified temperature and humidity limits

QuickTake 1.0 Application

- Display thumbnails of images
- Select, process, and view images
- Rotate images by ± 90°
- Crop, scale, and zoom in on images
- Cut, copy, and pates images into other applications
- Erase images in camera
- Save pictures in PICT, TIFF, or QuickTake file formats
- Transform images to 16 bit, 8 bit, and 1 bit
- Uses ColorSync for automatic color matching to screen and printer

(ColorSync included)
• Compress images with QuickTime software (QuickTime included)
• View images immediately with camera connected to Macintosh

QuickTake Setup

• Access from the control panel
• Lets you mount camera as a volume onto your desktop

System Requirements

• A Macintosh with a 68020 or higher central processing unit (any Macintosh except a Macintosh Plus, SE, Classic, Portable, or Powerbook 100)
• System software version 7.0.1 (with Tune-Up 1.1.1) or later
• 4 MB of RAM with 8 MB of virtual memory or 8 MB of RAM
• Apple SuperDrive
• Hard drive with at least 10 MB available

Article Change History:
17 Oct 1994 - Added Operating Environment specifications.
19 Apr 1994 - Added system requirements.

Macintosh LC 550: Specifications (Discontinued)

Revised: 8/19/96
Security: Everyone

Macintosh LC 550: Specifications (Discontinued)

==========

Article Created: 16 February 1994
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article provides technical specifications for the Macintosh LC 550 computer. Note that, in the U.S., this model is sold only through educational channels.

DISCUSSION ----------

Microprocessor

- MC68030, 33 MHz clock speed; 32-bit data bus
- Optional 68882 math coprocessor

PowerPC

- Upgradable to PowerPC when upgrade becomes available

Memory

- 4MB RAM on logic board
- Expandable (by authorized Apple dealer) to as much as 36MB by adding 1MB, 2MB, 4MB, 8MB, 16MB, or 32MB SIMM to a single 72-pin slot. SIMM Specification: 72-pin fast-paged, 80ns or faster SIMM.
- 1MB ROM

Storage

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 160MB hard drive
- Optional Internal AppleCD 300i Plus CD-ROM drive with new tray-loading design.
. • Does not require a CD caddy
. • Average access time: 295 ms

. • Capacity: 650MB
. • Supported formats: Multisession Photo CD, High Sierra (ISO 9660),
. Macintosh HFS, Audio CD, CD + G/CD + MIDI,
. CD-ROM XA, CD-I

Video Display

• Integrated Macintosh Color Display with 14-inch Trinitron CRT
• Resolution: 640 by 480 pixels, 69 dpi, .26 mm dot pitch
• Standard 512K VRAM supports 256 colors (8-bit color)
  Optional 1MB VRAM supports 32,768 colors (16-bit color)

Interfaces

• Internal expansion slot for one Macintosh LC processor-direct
  expansion card. Compatible with Apple IIe Card.
• SCSI interface for connecting up to five external devices
• Internal SCSI interface for connecting optional internal CD-ROM drive
• Two serial (RS-232/RS-422) ports
• One stereo sound-output port for external audio amplifier or headphones
• One Apple Desktop Bus (ADB) ports for keyboard, mouse, and other
  devices
• Front headphone jack
• Built-in microphone above display
• One sound-input port for four sources: included internal microphone, or
external Plaintalk Microphone, internal CD-ROM, or other external audio source

Pull-out Logic Board

• Allows easy upgrades to DRAM, VRAM, and PDS.

Sound Generator

• Stereo 8-bit digital-analog conversion using 22-kHz sample rate,
  capable of driving stereo headphones or other stereo equipment through
  the sound jack and headphone jack
• Two built-in stereo speakers
• CD output is 16-bit digital

Keyboard and Mouse

• ADB Mouse II
• Keyboard purchased separately only in the K-12 configuration; several ADB
  keyboards with numeric keypads available

Clock/Calendar

• Custom integrated circuit with long-life alkaline battery.

Disability Access

• CloseView, Easy Access, and visible-beep software are built in.

- Third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 90 to 264 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 40 W maximum, not including display
. 60 W maximum, including display
- Energy-saving feature reduces power consumption by 50%
- Energy Star compliant
- One AC outlet powers computer, display, drives, and speakers

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA, depending model used

Operating Environment

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: –40 to 116.6° F (–40 to 47° C)
- Relative humidity: 20% to 85% noncondensing
- Maximum altitude: 15,000 ft. (4,722 m)

Article Change History:
19 Aug 1996 - Corrected spelling.
03 Aug 1995 - Added information on PlainTalk Microphone requirement.
27 Jul 1995 - Corrected misspellings; reviewed.

A/UX and Compatible Macintosh Computers (8/94)

Revised: 8/29/94
Security: Everyone

A/UX and Compatible Macintosh Computers (8/94)

==========

Article Created: 16 February 1994
Article Reviewed/Updated: 29 August 1994

TOPIC ----------

This article describes which Macintosh computers do and do not support A/UX.

DISCUSSION ----------

Here is the list of Macintosh computers supported by A/UX 3.0.1 or 3.0.2:

- Mac SE/30
- Mac II (with PMMU)
- Mac IIx
- Mac IIcx
- Mac IIci
- Mac IIfx
- Mac IIsi
- Mac Centris 610 (only with third party FPU)
- Mac Centris 650 (only with FPU)
- Mac Quadra 610*, 650
- Mac Quadra 700, 800, 900, 950
- Apple Workgroup Server (AWS) 95

* A/UX will not work with 68LC040-based Quadra 610 computers, because the 68LC040 microprocessor doesn't have an FPU. The low-end Quadra 610 (8/160) and the Quadra 610 (8/160) DOS Compatible have the 68LC040 microprocessor.

Macintosh computers NOT supported by A/UX include:

- Mac IIvx
- Mac Quadra 630
- Mac Quadra 660AV
- Mac Quadra 840AV
- All Macintosh LC series computers (no FPU present)

All Macintosh PowerBook and PowerBook Duo computers
All Power Macintosh computers

Additionally, if you are installing A/UX on a supported Macintosh that requires a system enabler in order to boot, you can accomplish the installation by copying the necessary system enabler to the System Folder of the A/UX installation diskette prior to beginning the install.

A/UX 3.1 is only supported on the AWS 95, but it still can be purchased by existing non-AWS 95 customers for upgrade to A/UX 3.1.

Also, A/UX 3.0.1, 3.0.2, or 3.1 Finder interface is still based on Macintosh System 7.0.1.

Article Change History:
29 Aug 1994 - Added info about Quadra 630.
20 Jun 1994 - Added clarification on 68LC040-based computers.
06 Jun 1994 - Added Macintosh computers not supported by A/UX.

PowerCD and A/UX Incompatibility (6/94)

Revised: 6/6/94
Security: Everyone

PowerCD and A/UX Incompatibility (6/94)

==========

Article Created: 18 February 1994
Article Reviewed/Updated: 6 June 1994

TOPIC ----------

Is A/UX 3.0.1 compatible with the PowerCD? Will A/UX 3.1 be compatible?

DISCUSSION ----------

The Apple PowerCD is currently NOT compatible with A/UX 3.0. There are no known plans to make A/UX 3.1 compatible with the PowerCD.

If you try to run a PowerCD on an A/UX system, you may see the following symptoms:

- The PowerCD extension software will be crossed out on startup.
- Trying to mount a CD will always bring up this error message, "Not a Macintosh Disk: Do You Want To Initialize?"

Article Change History:
06 Jun 1994 - Included symptoms.

LaserWriter Pro 810: How to Enter Super User Mode (7/96)

Revised: 7/18/96
Security: Everyone

LaserWriter Pro 810: How to Enter Super User Mode (7/96)

==========

Article Created: 18 February 1994
Article Reviewed/Updated: 18 July 1996

TOPIC ----------

I am using NCSA Telnet to access the LaserWriter Pro 810's Remote Console Facility (RCF), and am unable to enter super user mode. I can, however, enter super user mode through a terminal that I have directly connected to the printer's RJ-12 port.

How can I enter super user mode through Telnet?

DISCUSSION ----------

When using Telnet to enter super user mode on the LaserWriter Pro 810, you must change the carrige return configuration from CR-LF to CR-NUL. Here is how to make this change.

Step 1

Launch NCSA Telnet

Step 2

Choose Preferences from the Edit menu, and choose Sessions from the submenu.

Step 3

Click New to create a session, or highlight the session you normally use and Click Change.

Step 4

Select Berkley 4.3 CR mode.

This changes the carriage return mode to CR-NUL.

Step 5

Select OK to close the Sessions options dialog.

Step 6

Select OK to close the Sessions dialog.

Once you have changed the CR mode, you can enter the super user mode.

The password to enter the super user mode is: SYSTEM

Macintosh Plus: Limited Cursor Movement During Background Print

Revised: 2/21/94
Security: Everyone

Macintosh Plus: Limited Cursor Movement During Background Print

==========

Article Created: 21 February 1994

TOPIC ----------

Configuration:

- Macintosh Plus (4MB RAM)
- External hard disk
- StyleWriter II

During background printing, I can't move the cursor in certain directions:

- When connected to the printer port, I have only horizontal cursor movement.
- When connected to the modem port, I have only vertical cursor movement.

DISCUSSION ----------

We have verified this problem on a StyleWriter II with a Macintosh Plus. There was a Serial Driver patch created for other computers, and this patch doesn't work well on the Macintosh Plus.

You must do a "clean" system software version 7.1 installation, because the patch updated the System and can't be removed. Then drag the following items into the System Folder from the StyleWriter II version 1.2 disks (DON'T run the Installer as it will reinstall the patch):

- From Installer (Disk 1):
  - StyleWriter II
  - Chooser

- From Disk 2 Printer Software:
  - TrueType Fonts 2

    - And from within the "Printer Software 2" folder:
      - PrinterShare

- From Disk 3 Printer Software:
  - TrueType Fonts 3

- From Disk 4 Printer Software:
  - TrueType Fonts 4

Be aware that you may still see the "slow CPU and jerky mouse" syndrome. But you'll have a functional mouse while the printer is actually printing.

File Server 3.0, 4.0, & Pro: Which Workstation Version (2/94)

Revised: 2/21/94
Security: Everyone

File Server 3.0, 4.0, & Pro: Which Workstation Version (2/94)

==========

Article Created: 15 February 1994

TOPIC -----

I want to know what version of AppleShare Workstation software I can load on all my workstations to create messages from either 3.0.1, 4.0.x, or AppleShare Pro servers, and not get error messages. For example when I mount a server and get a dialogue indicating the next time I log in I'll have a new password. What is the latest workstation software that works with all the AppleShare File Servers versions I mentioned above?

DISCUSSION -----

The AppleShare Workstation software that comes with AppleShare 4.0 is version 3.5 and it is backward compatible, it will allow the workstation to get those messages you mentioned. We recommend using version 3.5.

DAL Support & Sales Info From Independence Technologies (2/94)

==========

Article Created: 15 February 1994

TOPIC -----

This article describes how to get support and sales information from Independence Technologies, Inc. (ITI) for Data Access Language (DAL).

DISCUSSION -----

With the agreement between Apple Computer and ITI, ITI will market DAL and provide all support to DAL customers. Existing DAL licensing agreements, independent software vendors (ISVs) and resellers will continue with ITI.

• Technical Support

  - In the USA, call ITI at 510-438-2095.

  - In Europe and Pacific, contact Apple locally as of February 15, 1994.

• Sales Support

  - Marsha Doyen, Manager DAL Sales at 510-438-2000.

For complete Independence Technologies, Inc. information, use "Independence Technologies" as a search string.

Macintosh Quadra 610 DOS Compatible: Specifications (1/95)

Revised: 9/29/95
Security: Everyone

Macintosh Quadra 610 DOS Compatible: Specifications (1/95)

==========

Article Created: 17 February 1994
Article Reviewed/Updated: 13 January 1995

TOPIC ----------

This article provides technical specifications for the Macintosh Quadra 610 DOS Compatible computer.

DISCUSSION ----------

Microprocessors

- 68LC040, 25-MHz clock speed, 32-bit data bus
- Intel 486sx, 25-MHz clock speed, 32-bit data bus

Memory

- Comes with 4MB of RAM on the logic board
- Expandable to 68MB of RAM by adding a Single Inline Memory Module (SIMM) to the 72-pin slot on the Macintosh logic board (dealer installation required).
- Single Macintosh-compatible 72-pin SIMM slot for up to 32 MB of 80ns local RAM on DOS Compatibility Card (dealer installation required).
- DOS environment can access either shared memory on the Macintosh logic board (up to 64MB) or local memory on the DOS Compatibility Card (up to 32MB)

Storage

- Built-in Apple SuperDrive 1.4MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal hard disk
- Optional internal CD-ROM drive

Displays

• Features built-in support for one or two displays
• Works with all Apple displays as well as third-party NTSC, PAL, VGA, and SuperVGA displays (Macintosh environment)
• Works with Apple 13-inch, 14-inch, and 16-inch displays as well as third-party VGA and SuperVGA displays (DOS environment)

Video RAM (VRAM)

• 512K standard, expandable to 1MB (Macintosh environment)
• 512K RAM for video (DOS environment)

Interfaces

• PC game port (DOS environment)
• SCSI interface for connecting up to six external peripheral devices
• AAUI-15 Ethernet connector
• Two serial (RS-232/RS-422) ports for Macintosh-compatible devices
• Video port for color and monochrome displays of various sizes and resolutions
• Two Apple Desktop Bus (ADB) ports for a keyboard, mouse, and other devices

Networking

• Serial port for AppleTalk
• Built-in Ethernet

Sound Generator

• Built-in speaker
• Stereo 8-bit sound capable of driving stereo headphones or other stereo equipment through the sound jack (Macintosh environment)

Sound Input

• 8-bit analog-to-digital monophonic recording
• Sample rates: 11 or 22 KHz

Keyboard and Mouse

• Several ADB keyboards with numeric keypads available
• Apple Desktop Bus Mouse II

Clock/Calendar

• Custom integrated circuit with long-life lithium battery

Disability Access

• CloseView, Easy Access, and visible-beep software are built in. These and third-party options provide alternative input and output devices.

Electrical Requirements

- Line voltage: 100 to 240 VAC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 210 W maximum, not including display power

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (depending on the keyboard used)

Size and Weight

- Height: 3.4 in. (8.6 cm)
- Width: 16.3 in. (41.4 cm)
- Depth: 15.6 in. (39.6 cm)
- Weight: 16.2 lbs (7.4 kg) Weight varies depending internal devices installed.

Operating Environment

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: –40° to 117° F (–40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:
13 Jan 1995 - Documented SIMM specification for DOS card.
20 Dec 1994 - Corrected RAM amount and number of SIMM slots.
18 Mar 1994 - Added "Macintosh" to title.

Macintosh LC 575: Description (3/95)

Revised: 3/17/95
Security: Everyone

Macintosh LC 575: Description (3/95)

==========

Article Created: 17 February 1994
Article Reviewed/Updated: 17 March 1995

TOPIC ----------

This article describes the Apple Macintosh LC 575 computer. Note that, in the U.S., this model is sold only through educational channels.

DISCUSSION ----------

Overview

The Apple Macintosh LC 575 is Apple's most powerful all-in-one computer. Its integrated design combines logic board and monitor in a single package with stereo speakers and a microphone.

With its fast 33 megahertz 68040 microprocessor, the Macintosh LC 575 performs at four times the speed of the Macintosh LC III. It supports up to 36 megabytes of memory and has 160 and 320 megabyte internal hard drive options. Apple's new internal CD-ROM drive is included with most models. This new drive features tray-loading, so you'll no longer need a CD caddy.

The Macintosh LC 575 is expandable with a LC-compatible processor-direct slot and a communications slot for Ethernet networking or a high-speed fax/data modem.

Features

Power and Speed

- 33 megahertz 68LC040 microprocessor with 32-bit data bus
- 5 megabytes of RAM, expandable to 36 megabytes
- 512 kilobytes or 1 megabyte of VRAM for 8-bit color standard (optional 16-bit)

- Built-in double-speed, tray-loading CD-ROM drive (on most models)
- 160 and 320 megabyte hard disk drive options

Convenience

- Features all-in-one design for easy setup and use
- Includes front-panel contrast and volume controls and a headphone jack, as well as a keyboard power on/off switch
- Conserves energy by reducing power consumption by more than 50 percent

Broad Expansion Capabilities

- PowerPC upgradable when upgrade becomes available
- Comes with built-in ports to support a wide range of peripherals
- Features a Macintosh LC-compatible processor-direct slot
- Includes a communication slot for 14.4 KB fax/modem or Ethernet connection

Ordering Information

Macintosh LC 575 4/160
Order No. M2618LL/B
- Macintosh LC 575 computer with 4MB of RAM, 512K of VRAM, built-in 1.4MB Apple SuperDrive, and internal 160 MB hard disk drive
- System software version 7.1
- Limited warranty

Macintosh LC 575 5/160
Order No. M2461LL/B
- Same as Order No. M2618LL/B, but with 5MB of RAM, 1MB of VRAM, and an internal CD-ROM drive

Macintosh LC 575 8/160
Order No. M1797LL/B
- Same as Order No. M2461LL/B, but with 8MB of RAM

Article Change History:
17 Mar 1995 - Corrected wording of PowerPC.
01 Dec 1994 - Removed mention of Macintosh LC 575 Upgrade.

Macintosh LC 550: Description (3/95)

==========

Article Created: 17 February 1994

TOPIC ----------

This article describes the Apple Macintosh LC 550 computer. Note that, in the U.S., this model is sold only through educational channels.

DISCUSSION ----------

Overview

The Apple Macintosh LC 550 is a low cost, yet powerful all-in-one computer. Its integrated design combines logic board and monitor in a single package with stereo speakers and a microphone.

With its 33 megahertz 68030 microprocessor, the Macintosh LC 550 performs 25 percent faster than the Macintosh LC III. It supports up to 36 megabytes of memory and has a 160 megabyte internal hard drive options. As an option, you can add Apple's new internal CD-ROM drive. This new drive features tray-loading, so you'll no longer need a CD caddy.

The Macintosh LC 550 is expandable with a LC-compatible processor-direct slot.

Features

Power and Speed

- 33 megahertz 68030 microprocessor with 32-bit data bus
- Optional 68882 math coprocessor
- 4 megabytes of RAM, expandable to 36 megabytes
- 512 kilobytes of VRAM for 8-bit color standard (optional 1MB of VRAM for 16-bit color)
- Optional internal double-speed, tray-loading CD-ROM drive
- 160 megabyte hard disk drive

Convenience

- Features all-in-one design for easy setup and use
- Includes front-panel contrast and volume controls and a headphone jack, as well as a keyboard power on/off switch

Apple Workgroup Server 95: Description (10/94) (Discontinued)

Revised: 10/4/94
Security: Everyone

Apple Workgroup Server 95: Description (10/94) (Discontinued)

==========

Article Created: 17 February 1994
Article Reviewed/Updated: 04 October 1994

TOPIC ----------

This article describes the Apple Workgroup Server 95.

DISCUSSION ----------

The Apple Workgroup Server 95 provides the performance, reliability, scalability, and manageability you need to meet the requirements of medium-sized workgroups for file and print, workgroup database, information retrieval, or other server-based solutions.

It is easy to maintain, manage, reconfigure, and expand. Over the long run, the Apple Workgroup Server 95 offers the lowest cost of ownership in its class.

The most powerful Apple server, this system is based on the fast 33-megahertz Motorola 68040 microprocessor. With AppleShare Pro, and on-board Ethernet and AppleTalk networking capability, the Apple Workgroup Server 95 is ideal for up to 200 active users (that is, users simultaneously reading from and writing to the server). It can act as a communications server by running applications such as Apple's SNA•ps, MacX25, or MacX.400 gateway products.

The Apple Workgroup Server 95 is expandable. You can add up to 256MB of RAM, install up to four NuBus cards, and store up to five additional high-capacity internal storage devices, such as an internal DDS-DC 4mm tape drive for backups.

High Performance

- Leading AppleShare file-server performance
- Tunes for relational database performance
- Enhanced with SCSI DMA, asynchronous I/O, and a large external cache

Expansion

- 16MB RAM, expandable to 256MB
- Four SCSI channels (two SCSI DMA)
- Up to 20 SCSI devices
- Room for six internal SCSI drives
- Four usable NuBus expansion slots
- Up to 5,000 open files when running AppleShare Pro, compared to 346 open files with other AppleShare systems

Usability

- Preinstalled Operating system, file/print services, backup, and networking software
- Pretuned and configured for file services or relational database
- Easy server administration with Macintosh System 7 user interface
- Full-function, graphical backup utility

System Software

- Tunes version of A/UX, a standard UNIX operating system, with Macintosh System 7 features
- Preinstalled TCP/IP and NFS software

Networking

- Built-in support for AppleTalk, TCP/IP, Ethernet and LocalTalk networks

Order Information

Apple Workgroup Server 95 16/SD/230/128
Order No. M6855LL/A
- Apple Workgroup Server 95 computer with 16MB RAM, 230MB internal hard disk, built-in 1.4MB Apple SuperDrive, and 128K memory cache
- Mouse
- A/UX system software for file and print service environment, Apple documentation viewer, and Retrospect Remote backup software preloaded on hard drive
- A/UX system software installer CD-ROM (one-button installation of above software)
- Complete on-line and hard-copy documentation
- Limited warranty statement

Apple Workgroup Server 95 32/SD/1000/512/DDS-DC/AppleShare Pro
Order No. M6875LL/A
- Apple Workgroup Server 95 computer with 32MB RAM, built-in 1.4MB Apple SuperDrive, 1000MB (1GB) internal hard disk, 512K second-level 68040 memory cache, and an internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- AppleShare Pro file and print server software preloaded on hard drive, on-line documentation for AppleShare Pro, and installer software on

CD-ROM
- All other features included with the Apple Workgroup Server 95 16/SD/230/128

Apple Workgroup Server 95 48/SD/230/1000/512/DDS-DC
Order No. M6895LL/A
- Apple Workgroup Server 95 computer with 48MB RAM, built-in 1.4MB Apple SuperDrive, 230MB and 1000MB (1GB) internal hard disk, 512K second-level 68040 memory cache, and an internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- A/UX system software for database service environment, Apple documentation viewer, and Retrospect Remote backup software preloaded on hard drive
- A/UX system software installer CD-ROM (one-button installation of above software)
- SCSI cable and bracket needed to support five internal hard drives
- Complete on-line and hard-copy documentation
- Limited warranty statement

Apple Workgroup Server 95 32/SD/2000/256/DDS-DC/AppleShare Pro
Order No. M3074LL/A
- Apple Workgroup Server 95 computer with 32MB RAM, built-in 1.4MB Apple SuperDrive, 2000MB (2GB) internal hard disk, 256K second-level 68040 memory cache, and an internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- AppleShare Pro file and print server software preloaded on hard drive, on-line documentation for AppleShare Pro, and installer software on CD-ROM
- All other features included with the Apple Workgroup Server 95 16/SD/230/128

Apple Workgroup Server 95 48/SD/230/2000/512/DDS-DC
Order No. M3075LL/A
- Apple Workgroup Server 95 computer with 48MB RAM, built-in 1.4MB Apple SuperDrive, 230MB and 2000MB (2GB) internal hard disk, 512K second-level 68040 memory cache, and an internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- All other features included with the Apple Workgroup Server 95 48/SD/230/1000/512/DDS-DC

Discontinued Configurations

Apple Workgroup Server 95 16/SD/500/256/DDS-DC
Order No. M6865LL/A
- Apple Workgroup Server 95 computer with 16MB of RAM, 500MB internal hard disk, built-in 1.4MB Apple SuperDrive, 256K second-level 68040 memory cache, and an internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- All other features included with the Apple Workgroup Server 95 16/SD/230/128

Apple Workgroup Server 95 32/SD/230/500/256/DDS-DC
Order No. M6885LL/A
- Apple Workgroup Server 95 computer with 32MB RAM, built-in 1.4MB Apple

SuperDrive, 230MB and 500MB internal hard disk, 256K second-level 68040 memory cache, and an internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- System software for database service environment, Apple documentation viewer, and Retrospect Remote backup software preloaded on hard drive
- System software installer CD-ROM (one-button installation of above software)
- Complete on-line and hard-copy documentation
- Limited warranty statement

Ordering Information For Upgrade Kits And Accessory Kits

AppleShare Pro
Order No. M6825Z/A
- File and print software for Apple Workgroup Server 95

Apple Workgroup Server PDS Card Upgrade Kit*
Order No. M6940Z/A
- Processor-direct slot card for the Macintosh Quadra 900 or 950 (128K second-level memory cache on-board)
- A/UX system software installer CD-ROM (one-button installation of system software, Apple documentation viewer and Retrospect Remote backup software
- A/UX CD-ROM for file/print environment and A/UX CD-ROM for database environment
- Complete documentation
- Limited warranty statement
- CPU labels

Apple Workgroup Server PDS Card/DDS-DC Drive Upgrade Kit*
Order No. M6945Z/A
- Processor-direct slot card for the Macintosh Quadra 900 or 950 (128K second-level cache on-board)
- Internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- All other features included with the Apple Workgroup Server PDS Card Upgrade Kit for the Macintosh Quadra 900 or 950

  * These kits upgrade a Macintosh Quadra 900 or 950 to an Apple Workgroup Server 95. A CD-ROM drive is required to install system software.

Apple Workgroup Server 95 128KB/Tag Second-Level Memory Cache Upgrade Kit
Order No. M6810Z/A
- Adds an additional 128K and Tag second-level 68040 memory cache to the PDS card, for a total of 256K of second-level memory cache

Apple Workgroup Server 95 256KB Second-Level Memory Cache Upgrade Kit
Order No. M6815Z/A
- Adds an additional 256K of second-level 68040 memory cache to the PDS card for a total of 512K second-level memory (Requires installation of 128KB/Tag kit)

Apple Workgroup Server 95 16MB Parity DRAM Upgrade Kit
Order No. M6820Z/A
• Adds 16MB of parity DRAM to the Apple Workgroup Server 95

Blank DDS Tape 5 Pak
Order No. M2092Z/A
• Blank DDS tape for use with internal DDS-DC drive.(Tape uses the Media Recognition System (MRS) standard.)

Centris/Quadra 610: Logic Board Upgrade Options (8/94)

==========

Article Created: 17 February 1994
Article Reviewed/Updated: 05 August 1994

TOPIC ----------

The upgrade from the Centris 610 or Quadra 610 to the Quadra 660AV has been discontinued. This article describes the Power Macintosh 6100/60 upgrade.

DISCUSSION ----------

The Macintosh Quadra 660AV Logic Board Upgrade (Order No. M1534LL/A) has been discontinued. The only current upgrade for the Centris/Quadra 610 is to a Power Macintosh 6100/60, part number M2901LL/A.

This upgrade includes system software, 8MB DRAM, 2MB VRAM, PlainTalk Microphone, cables for S-video to composite, and a name plate.

Article Change History:
05 Aug 1994 - Documented that this upgrade is no longer available, added Power Macintosh upgrade.

HyperCard 2.2: Screen Doesn't Refresh Color When Scrolling

Revised: 2/18/94
Security: Everyone

HyperCard 2.2: Screen Doesn't Refresh Color When Scrolling

==========

Article Created: 18 February 1994

TOPIC --------------------

If a color object is in a scrollable window, and the window is then scrolled, the area scrolled onto the screen will be white. This is because the stack is not refreshing itself properly during the scroll. It is possible to program around this.

DISCUSSION --------------------

In the OpenStack handler (or any setup handler) check the visible of the scroll window to see if refresh routines are necessary:

```
on (some action)
  global needsRefresh
  if the visible of window "scroll" then put true into needsRefresh
end (some action)
```

Then any other handler could periodically call a refresh handler:

```
on idle -- or whatever
  refreshScreen
end idle

on refreshScreen
  global needsRefresh
  if needsRefresh then go this card
end refreshScreen
```

Revised: 2/22/94
Security: Everyone

A/UX 3.0: Tracking ftp Access (2/94)

==========

Article Created: 21 February 1994

TOPIC ----------

A/UX doesn't log ftp transactions the way most UNIX computers do. People tell me that on other computers, ftp transactions appear in /usr/adm/messages, but it seems that under A/UX, ftp transactions aren't logged at all. Can you tell me how to log ftp transactions under A/UX 3.0?

DISCUSSION ----------

The "-l" option of in.ftpd in A/UX had bugs. But there's a newer version of in.ftpd posted on the Internet, which logs all uses of ftp on your system and especially pays attention when someone logs in via anonymous ftp. It logged a great deal of information via syslogd daemon.

We suggest that you upgrade to this version of in.ftpd to log ftp transactions properly. The newer version of in.ftpd is available from the Internet host, jagubox.gsfc.nasa.gov (128.183.44.1), via anonymous ftp. Get the AAA.AUX.README file for more information.

AppleShare 4.0.1: Can't Share Files with Remote NFS Volume

Revised: 2/22/94
Security: Everyone

AppleShare 4.0.1: Can't Share Files with Remote NFS Volume

==========

Article Created: 21 February 1994

TOPIC -----

We need to use a Macintosh Quadra 800 as an AppleShare 4.0.1 server. However, the Quadra 800 is currently an NFS client to an Apple Workgroup Server 95, using NFS Share version 1.3.5 from InterCon.

When AppleShare 4.0.1 starts up, it scans all volumes on the desktop and gives an "access privilege not correct" message on the remotely mounted NFS volume. We understand that AppleShare 4.0.1 expects to see only HFS volumes, but is there any workaround that would allow us to use file sharing with the remotely mounted NFS volume from AppleShare 4.0.1?

DISCUSSION -----

AppleShare only allows using local volumes for file sharing. It won't allow you to establish file sharing with a remote volume like NFS Share from InterCon. There's no public API to allow AppleShare to "publish" remote volumes mounted on the AppleShare server.

On a side note, it isn't that AppleShare 4.0.1 expects to see only HFS volumes. The volumes must be local to the server, they don't necessarily have to be HFS volumes.

Converting From Novell DataClub To AppleShare (2/94)

Revised: 2/21/94
Security: Everyone

Converting From Novell DataClub To AppleShare (2/94)

==========

Article Created: 18 February 1994

TOPIC -----

This document describes some methods for converting a Novell DataClub file sharing environment into an AppleShare server. It also presents some instructions for removing the DataClub software from the Macintosh, after the data, users, and security information have been successfully converted to the new file-sharing environment.

DISCUSSION -----

We suggest three methods for converting data stored on a DataClub file server volume into an AppleShare volume. Each method has its own benefits, but all have the same drawbacks; none of these methods preserves the security information established by the DataClub software. Therefore, we strongly recommend that you use the DataClub Admin utility to obtain a thorough summary of all information about users, groups, and the security of shared files and folders before destroying any DataClub volume(s). You must then explicitly recreate all the user names and security assignments for files and folders that you previously established using DataClub on the new AppleShare server. This is essential in order to minimize difficulties for end users during and after the conversion process.

- You can back up the DataClub volume, whether it is a dedicated server volume or a distributed or "virtual" volume, by using a number of tape drive utilities. Retrospect, from Dantz Software, is one example of a DataClub-compatible tape back-up system.

  When using a tape back-up system, be particularly aware of any restrictions on how you can restore the data to a different volume. Each tape back-up vendor's solution may incorporate differing rules concerning existing volume names, new volume names, or incremental restorations. So be sure to verify that you can successfully restore all the data to the new volume before destroying the old DataClub volume.

- You can copy the data on a DataClub volume directly to the new AppleShare volume. To do this, mount both the DataClub and the AppleShare volumes on the desktop of the client Macintosh. Then, simply drag-copy the data—and directory structure, if you want—from one volume to the other.

  This method may be slower than others, but it allows you to verify the data's integrity on the new volume at arbitrary times during the process. If a problem occurs, you can halt the process and troubleshoot the problem at that time.

- You can move the data on the DataClub volume to some other intermediate storage, such as a workstation user's local hard disk or some removable storage such as a writable magneto-optical drive. You can even copy all the DataClub data to 1.44 MB floppy disks. After moving the data to intermediate storage, you can easily copy the data to the new AppleShare volume.

  This method is probably the most labor-intensive of the three. However, if you do not have a tape back-up utility and want to install the AppleShare server software on the same machine as the current DataClub DSM (Dedicated Server Module) software, this method may offer the most desirable solution. In this case you can verify the data's integrity on the intermediate media at arbitrary times during the copying process. Then, during the software conversion from DataClub to AppleShare, you can retain the media in a safe place. Finally, after you install the new AppleShare file server, you can recopy the data to the new volume.

Removing DataClub from the Macintosh

It is important that you not remove the DataClub software or the hidden volume before successfully restoring the data on a new volume where you can verify the data's integrity.

We suggest two methods for removing the DataClub software from a Macintosh volume. Both of them require a resource editor program like ResEdit from Apple Computer or the Norton Utilities from Symantec.

- Use your favorite resource editor on each Macintosh where DataClub is installed. First, turn DataClub off in its Control Panel and restart the Macintosh. Then use the resource editor to find the hidden DataClub folder. (The folder name may include five nonprinting boxes.) After you find the folder, use the resource editor to make the folder visible so that you or the workstation user can move the folder to the Trash, as with any other folder on the local volume. The time required to empty the Trash depends on how much data the folder contains. This method may be the faster of the two, but it requires a person familiar with resource editors to perform the operation on every Macintosh where DataClub is installed.

- If DataClub is installed on every Macintosh, and each Macintosh has made its hard disk available for use by DataClub, you can remove the DataClub software from each Macintosh in a step-wise fashion. We recommend that you remove DataClub software from Macintosh workstations in order, based

on the amount of available disk space on each Macintosh:

1) Remove DataClub from the Macintosh with the least available disk space.

2) Proceed to the Macintosh with the second least available disk space, and continue in this order.

3) Remove DataClub from the Macintosh with the most available disk space.

Starting with the first Macintosh, open its DataClub Control Panel and uncheck the checked disks in "Use these disks" list. This will cause DataClub to move any shared data residing on the first Macintosh to other Macintosh clients on the DataClub network. After DataClub has moved the data, turn off DataClub by clicking the OFF radio button in the DataClub Control Panel. If at any point during the automatic data migration a problem arises, use a resource editor (as described in the first method, above) to remove DataClub from the volume. After restarting the Macintosh and verifying that DataClub does not load, move the DataClub Control Panel into the Trash. If any DataClub applications like the Admin utility reside on the Macintosh, throw them away also because they are not useful without the DataClub software.

Repeat the steps in this method on every Macintosh client until all the data (files and folders) reside on the last Macintosh on the network. On this workstation, turn DataClub off in the Control Panel, and restart the machine. Use a resource editor to find the hidden DataClub folder on the root of the volume and make it visible. After quitting the resource editor, simply move the entire DataClub folder into the Trash. The time required to empty the Trash depends on how many files are in the folder.

SNA•ps Print: CEI Printer for Multipart Forms (2/94)

Revised: 2/23/94
Security: Everyone

SNA•ps Print: CEI Printer for Multipart Forms (2/94)

==========

Article Created: 21 February 1994

TOPIC ----------

Is there any printer that SNA•ps Print can use to print multipart forms?

DISCUSSION ----------

CEI Systems has the CEI 420 printer, a 420 character-per-second dot-matrix impact printer suitable for multi-part forms. It prints forms including invoices, W-2 forms and other tax forms, and checks. It provides inexpensive, fast, high-quantity printing. A Macintosh-compatible driver is available, and seems to work quite well.

LaserWriter Driver 8 Versions: Retain Preferences Differently

Revised: 2/23/94
Security: Everyone

LaserWriter Driver 8 Versions: Retain Preferences Differently

==========

Article Created: 22 February 1994

TOPIC ----------

Is there a way for the LaserWriter driver to retain the configuration information so it remembers that a LaserWriter Pro 630 has an envelope feeder?

I'm using two LaserWriter 8.1.1 drivers (differently named) on my PowerBook. I select one for my LaserWriter Pro 630 at home (which doesn't have an envelope feeder), and select another for my LaserWriter Pro 630 at work (which does have an envelope feeder). Neither driver can save these types of settings independently. What's wrong?

DISCUSSION ----------

The LaserWriter driver 8.1.1 driver uses a Preferences file to store Envelope Feeder option information. All LaserWriter 8.1.1 drivers (regardless of what you name them) look to this file for option information, so there's no way to save settings independently.

A possible workaround is to use both LaserWriter driver 8.0 and 8.1.1, as it seems LaserWriter driver 8.0 stores its information in the LaserWriter 8 Preferences file differently. Of course, you don't get the benefits of LaserWriter driver 8.1.1 on one printer.

LaserWriter Pro 810: Total Memory Available (2/94)

Revised: 2/23/94
Security: Everyone

LaserWriter Pro 810: Total Memory Available (2/94)

==========

Article Created: 22 February 1994

TOPIC ----------

I have noticed a big difference between the LaserWriter Pro 810 and several printers with the Total Memory available (information available in the "Printer info" dialog box of LaserWriter driver 8 versions). The LaserWriter Pro 810 seems to have less total Memory available. Here's a table of some Apple printers:

	Pro 810	Pro 810	Select 360	Pro 630	Pro 630	LW IIg
Résolution	400dpi	800dpi	600dpi	600dpi	300dpi	300dpi
RAM	8MB	8MB	7MB	8MB	8MB	4MB
Total Memory available	348,4K	356,5K	1 ,3MB	2,2MB	2,2MB	1,7MB

Can you explain the differences for the total memory available among the printers listed?

DISCUSSION ----------

The total memory available is the amount of memory left after the printer has set aside its required space to operate. The majority of this is the largest page buffer possible at the highest resolution, given the amount of memory installed in the printer.

For example, a LaserWriter Pro 630 with 8MB of RAM would allocate a page buffer for a 600dpi Legal-sized page (approximately 5MB). The LaserWriter Pro 810 with 8MB of memory would allocate a page buffer for an 800dpi Letter-sized page (approximately 6.8MB) since there isn't

enough memory to create a page buffer for an 800dpi Legal-sized page (approximately 8.8MB).

In addition to the page buffer, the printer needs to allocate space for the PostScript interpreter itself, PostScript dictionaries, display list, font caching, and program memory.

SNA•ps Gateway, SNA•ps 5250, and IBM 5494 Controller (2/94)

Revised: 2/23/94
Security: Everyone

SNA•ps Gateway, SNA•ps 5250, and IBM 5494 Controller (2/94)

==========

Article Created: 21 February 1994

TOPIC ----------

I need to install a SNA•ps Gateway and SNA•ps 5250 which will attach to a remote IBM 5494 mod.2 controller equipped with Token Ring. The IBM 5494 is connected to an AS/400 through an X.25 line. The SNA•ps Gateway Macintosh will connect through Token Ring to the IBM 5494.

Is it possible to do this? If it is, how should I configure the IBM 5494 controller, the devices on the AS/400, and the SNA•ps Gateway?

DISCUSSION ----------

This is possible to do with the SNA•ps Gateway and SNA•ps 5250.

This is a complex configuration mostly because the IBM 5494 is very different from all previous IBM mid-range controllers. The IBM 5494 is an APPC LEN device (similar to that of a SNA•ps Gateway). It attaches to the AS/400 using special code included with OS/400 V2R2M0, which requires the IBM 5494 to connect to the AS/400 as a Token Ring or SDLC based APPC controller. (X.25 connection for SDLC is just fine). The Twinax devices on the physical IBM 5494 have to be associated with some remote Workstation controller on the AS/400 which manages the LU 4-7 sessions used by the Twinax ports. The connection between the APPC connection and the Remote Workstation controller is done by an AUTOCONFIGURED APPC parallel session between the APPC 5494 connection and the Remote workstation controller. If the IBM 5494 configuration is setup to support downstream PU 2.1 and passthru to the AS/400, (such as a SNA•ps APPC gateway), then there is just an APPC controller passing through the IBM 5494 to an APPC controller on the AS/400. The IBM 5494 just provides the pipeline to the AS/400. This is quite similar to how a SNA•ps Gateway in 3270 environments is a PU 2.0 downstream from IBM 3174 Cluster Controller.

Through all of this you need to know AS/400 Network IDs, Remote LUs, and Local LUs for the SNA•ps APPC connection, and use known Mode descriptions.

That is all very basic information to a knowledgeable APPC system manager.

The most difficult to understand in the configuration of the SNA•ps Gateway in this setup were the XIDs to be used. The Gateway XID in the SNA•ps Gateway config can be anything, we used 050 00000. BUT the XID for the Partner (the IBM 5494 in this case) HAS to be 073 00000, which is the default value given the IBM 5494 if it is configured with downstream support for PU 2.1 on Token Ring. Also, the Link address in the SNA•ps config is the Token Ring address of the IBM 5494 controller which is placed in the IBM 5494 when customization is done. The IBM 5494 does not care about the Token Ring address of the SNA•ps Token Ring card (the address in the Apple Token Ring Control Panel).

We would suggest that you carefully read the IBM 5494 documentation, and get a copy of the current IBM RedBook on configuring 5494 to AS/400 - P/N GG24-3828-00. We found it to be very helpful.

MacCheck 1.0.5 Read Me (2/94)

Revised: 2/22/94
Security: Everyone

MacCheck 1.0.5 Read Me (2/94)

==========

Article Created: 22 February 1994

TOPIC --------------------

This article's discussion section contains the MacCheck 1.0.5 Read Me file.

DISCUSSION --------------------

MacCheck 1.0.5 Release Notes

This Read Me document contains information about the MacCheck program. The Microsoft Word and MacWrite II documents, "MacCheck User Guide.msWrd" and "MacCheck User Guide.mwII" are a superset of this document and provide easier to read (better formmated and highlighted) text, along with more technical details about the inner workings of MacCheck. These documents are found in the Software Utilities Update 1.0.1 disk release.

Changes between MacCheck 1.0.4 and 1.0.5

- MacCheck no longer crashes when running on 3rd party NuBus cards.
- MacCheck now displays the "true" System Enabler version ("7.1--1.0.1").
- MacCheck displays the processor speed more accurately--MacCheck would not tell when a faster clock crystal was added, nor was able to accurately display the speed when running on some accelerator cards.
- MacCheck no longer fails the logic board test when a DayStar accelerator card is being used (or any other card that patches the ROM image, but fails to put a real ROM checksum in).
- If you double-click on the "MacCheck dataFile", MacCheck no longer puts up the annoying "Can't open this kind of document" message.

This ReadMe document contains information about the MacCheck program. The Microsoft Word and MacWrite II documents, "MacCheck User Guide.msWrd" and "MacCheck User Guide.mwII" are a superset of this document and provide easier to read (better formatted and highlighted) text, along with more technical details about the inner workings of

MacCheck.

I. INTRODUCTION TO MACCHECK

MacCheck is an Apple support utility tool with which you can learn more about your Macintosh computer, as well as diagnose software problems that result from corrupted directories and files. By using MacCheck in conjunction with Disk First Aid, you can resolve common disk corruption problems.

MacCheck creates a profile of your Macintosh computer, including:

- The processor, memory, expansion cards, SCSI drives, keyboard, monitor, and so on
- The installed applications and system software on your startup drive

MacCheck also provides:

- A general logic board test
- A checker for the file system and System files
- A checker for duplicate System Folders

The MacCheck product consists of the application file "MacCheck," and the data file "MacCheck dataFile." For MacCheck to work correctly, both the application file and the data file must be located in the same folder. MacCheck is compatible with System 7.0 or later.

Under most circumstances, MacCheck can be run with extensions on. However, if you are having trouble running MacCheck, you should turn extensions off (by restarting your computer while holding down the Shift key). MacCheck does conflict with some non-Apple extensions:

- Thunder 7
  Don't run MacCheck while Thunder 7 is active. MacCheck and Thunder 7 have serious conflicts.
- Virus protection programs
  You'll need to "teach" some virus protection programs about MacCheck.
- Electronic mail programs
  Sometimes when electronic mail programs, such as Microsoft Mail or QuickMail, are active, they disrupt the file system checking by making your startup volume "busy".

II. MACCHECK OVERVIEW

Launching MacCheck

When you launch MacCheck, you'll see a splash screen detailing the initialization processes that MacCheck performs while it starts up. During most of this time, MacCheck gathers profile information and checks for multiple System Folders. On a new Macintosh LC III, MacCheck takes about 1 minute to launch; on a 400MB, 8,000-plus-file Macintosh Quadra 950, it takes about 4-5 minutes to launch.

Note: If you want to speed up the launch process by about 20 seconds, press the Space bar when the splash screen first appears. This tells MacCheck not to profile modems or check SCSI devices that are typically slow, such as DAT tape drives. MacCheck will display a "•QuickBoot•" message. If you wish to quit the launch process at any time, press command-period.

Accessing Profile Information

MacCheck stores the collected profile information in three log files, the "System Info," "Additional System Info," and "Application and Font Info" logs. To view the profile information placed into these logs, select the log you want from the Windows menu.

Starting Logic Board and File System Tests

To start the logic board and file system tests, click the Test button or select the Test option (command-G) in the Diagnostics menu. When these tests are completed, MacCheck stores the results in a results file. The default name of this file is "Test Results-1". You may rename this file by selecting the Save Results As option in the File menu.

System 7 Pro 7.1.1 Read Me (2/94)

Revised: 2/22/94
Security: Everyone

System 7 Pro 7.1.1 Read Me (2/94)

==========

Article Created: 22 February 1994

TOPIC ----------

This article's discussion section contains the System 7 Pro 7.1.1 Read Me file.

DISCUSSION ----------

WELCOME TO SYSTEM 7 PRO, Version 7.1.1

This document provides late-breaking news about System 7 Pro. This information is not in the documentation that came with your software. For all other questions, refer to your Macintosh software documentation.

APPLESHARE SERVER SOFTWARE

To install an AppleShare file server or print server on a Macintosh using System 7 Pro, you need AppleShare server software version 3.0.3. An application that updates your existing AppleShare file server or print server software to version 3.0.3 is on the disk titled "Before You Install."

APPLE IIe CARD SOFTWARE FOR THE MACINTOSH LC II

To use the Apple IIe Card with System 7 Pro on a Macintosh LC II, you need version 2.2 of Apple IIe Card Software. You should upgrade to version 2.2 only if you are using your LC II with System 7 Pro. Apple IIe Card Software 2.2 may also be used with the original Macintosh LC, but it is not required.

You can obtain the upgrade package from an authorized Apple Reseller. In the United States, you can call the Apple Customer Assistance Center at 1-800-776-2333 to request Apple IIe Card Software version 2.2. The new software is also available on AppleLink (AppleLink path: Apple

Products: Apple II: Apple II Product Information: Apple IIe Card).

INSTALLING SYSTEM 7 PRO ON A MACINTOSH QUADRA 700 AND 950

To install System 7 Pro on a Macintosh Quadra, use the Installer program's Easy Install option, or choose "System software for any Macintosh" in the Installer's Customize window. If you use the Macintosh Quadra option in the Customize window, some parts of the Monitors control panel will not work correctly.

MacTCP USERS: CHECK VERSION BEFORE YOU INSTALL System 7 Pro

To use MacTCP with System 7 Pro, you need version 1.1.1 or later. If the version number is 1.1 or earlier, you need to remove the file from your System Folder before you install System 7 Pro.

IF THE SYSTEM 7 PRO INSTALLATION FAILS

The installation may fail if your existing System file contains fonts with names having more than 31 characters.

If this happens, follow these steps:

1) Open the System Folder and move the System file to the desktop.
2) Restart the Macintosh using the Install disk. When the Installer opens, proceed with the installation (refer to your manual for help).
3) Restart the Macintosh when the installation is completed.
4) If you wish to use the fonts that were installed in your old System file with System 7 Pro, open the System file on the desktop and drag the font icons to the System Folder icon. The fonts are moved to the Fonts folder and can now be used.

If you had installed additional software that modified the System file, you will need to reinstall it after you install System 7 Pro.

USING ADOBE TYPE MANAGER WITH SYSTEM 7 PRO

In System 7 Pro, a new folder named "Fonts" stores all screen and printer fonts. Fonts you drag to the System Folder are automatically installed in the Fonts folder. If you use Adobe Type Manager, but are not getting smooth type on-screen, you must move any PostScript printer fonts located in the Fonts folder to the Extensions folder. Please contact Adobe to obtain a new version of ATM that will allow you to use the Fonts folder (see details below).

A Gift to You From Adobe

Adobe Systems is pleased to offer Apple computer owners a free copy of award-winning Adobe Type Manager (ATM) software.

With ATM, you'll gain access to thousands of PostScript Type 1 fonts for use on screen. Plus, ATM software can be used with all

Macintosh-supported printers, including the ImageWriter, StyleWriter, LaserWriter, and PostScript typesetters.

As a special bonus, you'll also receive four free typefaces from the Adobe Garamond family. These Adobe Originals are a fresh treatment of some of the most popular typefaces in history.

Take advantage of this incredible offer today! Order the latest release of ATM—plus the Adobe Garamond typefaces—and pay just a $7.50 shipping and handling charge ($30 outside the USA and Canada). Together, these products normally retail for $346!

U.S. and Canadian residents, call

1-800-521-1976 ext. 4400, or fax 1-303-792-2231

Outside the U.S. and Canada, call

(303) 799-4000 ext. 4600.

Fax requests please include name, shipping address, daytime phone and credit card information. Please allow 6-8 weeks for delivery. Outside the U.S. and Canada, you may either take advantage of this $30 offer for the English-language version of ATM shipped via courier, or see below for other offers that may be available in your country.

AV Series, Apple Nubus Video Cards: Compatibility (2/94)

Revised: 2/22/94
Security: Everyone

AV Series, Apple Nubus Video Cards: Compatibility (2/94)

==========

Article Created: 22 February 1994

TOPIC ----------

Of all of the NuBus Video cards Apple has produced, which Apple NuBus cards listed below are not considered "compatible" with the Macintosh Quadra 840AV, Quadra 660AV and Centris 660AV?

DISCUSSION ----------

The following list details all video cards tested for compatibility with the Macintosh AV Series. Each card is individually evaluated further in the discussion.

Video Card:	Compatible with:
Macintosh II 1 Bit Video Card	840AV(unsupported)
Macintosh II 4 Bit Video Card	840AV(See Note B)
Macintosh II 8 Bit Video Card	840AV(See Note B)
Macintosh II Hi-Res Display Card (4-Bit)	840AV
Macintosh II Extended Hi-Res Display Card (8-Bit)	840AV
Macintosh II Two-Page Video Card	Incompatible
Macintosh II Portrait Display Card	Incompatible
Macintosh II Portrait Display Card (DB15 connector)	Incompatible
Macintosh Display Card 4•8	840AV(See Note E)
Macintosh Display Card 4•8, Rev. B	840AV(See Note E)
Macintosh Display Card 8•24	840AV(See Note E)
Macintosh Display Card 8•24, Rev. B	840AV(See Note E)
Macintosh Display Card 8•24GC, Rev A	Incompatible
Macintosh Display Card 8•24GC, Rev B	840AV(See Note F)
Macintosh Display Card 24AC	660AV, 840AV

• NOTES FOR SPECIFIC CARDS:

A) Macintosh II 1 Bit Video Card

The 840AV was never tested with this card. While we did not encounter any problems during testing, it is officially untested and the possibility of hidden bugs remains.

B) Macintosh II 4 Bit Video Card
   Macintosh II 8 Bit Video Card

The Mac II High Res 4-bit and 8-bit video cards are compatible but will not drive Apple's 16-inch and 21-inch color monitors. Also, because these cards were designed only to drive the 12-inch High Res monochrome and the 13-inch RGB monitors, they have no sense line capability. Therefore, if they are placed in any Macintosh computer with a NuBus slot that is also supporting built-in video or a later version NuBus card, the boot up screen will automatically default to the old Mac II High Res 4-bit or 8-bit video card.

C) Macintosh II Hi-Res Display Card (4-Bit)
   Macintosh II Extended Hi-Res Display Card (8-Bit)

These cards are compatible with the Quadra 840AV.

D) Macintosh II Two-Page Video Card
   Macintosh II Portrait Display Card,
   Macintosh II Portrait Display Card,(DB15 connector)

Apple does not recommend that these cards be used in the Macintosh AV series. While they will not harm the computer, there are some timing differences with certain cards.

E) Macintosh Display Card 4•8
   Macintosh Display Card 4•8, Rev. B
   Macintosh Display Card 8•24
   Macintosh Display Card 8•24, Rev. B

The Macintosh 4•8 and 8•24 cards are compatible with the Quadra 840AV. If you're planning to use the Apple 16-inch or 21-inch color monitor with either of these cards, Apple recommends the Rev. B ROM upgrade, available from an Apple authorized service provider.

F) Macintosh Display Card 8•24GC, Rev. A
   Macintosh Display Card 8•24GC, Rev. B

The Rev A card is incompatible. The Rev B card is compatible, but not in the accelerated mode.

G) Macintosh Display Card 24AC

The card is a 7-inch NuBus card and therefore compatible with the Centris 660AV, Quadra 660AV and Quadra 840AV computers. The card can suffer significant performance problems (speed) when used in its accelerated mode.

LaserWriter Select: Envelope Tray Specifications (2/94)

Revised: 2/23/94
Security: Everyone

LaserWriter Select: Envelope Tray Specifications (2/94)

==========

Article Created: 23 February 1994

TOPIC ----------

What envelope sizes can I use in the LaserWriter Select envelope cassette tray?

DISCUSSION ----------

The LaserWriter Select 360 uses the same trays as the LaserWriter Select 300/310. Part number M2031G/A is the 30-envelope cassette to use with all LaserWriter Select printers.

The envelope cassette is center justified and can support up to 30 #10 business envelopes. It supports the following envelope sizes:

Description	Width	Length
Com #10	104.8mm (4.12")	241.3mm (9.5")
Monarch	98.4mm (3.87")	190.5mm (7.5")
DL	110.0mm (4.33")	220.0mm (8.66")

System 7 Pro: Assistant Toolbox is Compatible (2/94)

Revised: 2/23/94
Security: Everyone

System 7 Pro: Assistant Toolbox is Compatible (2/94)

==========

Article Created: 23 February 1994

TOPIC -----

The Compatibility Checker in System 7 Pro erroneously removes part of the PowerBook File Assistant out of the System Folder.

DISCUSSION -----

When running the System 7 Pro Compatibility Checker, the file Assistant Toolbox is flagged as not compatible with System 7 Pro and removed from the System folder. All parts of the PowerBook File Assistant, Control Panel, The File Assistant, and the Assistant Toolbox, are compatible with System 7 Pro.

Work Around

After running the Compatibility Checker, move the Assistant Toolbox back into the System folder.

Newton: System Update 1.05 Changes and Features (2/94)

Revised: 2/23/94
Security: Everyone

Newton: System Update 1.05 Changes and Features (2/94)

==========

Article Created: 23 February 1994

Topic ----------

What features does Newton System Update 1.05 provide?

Discusion ----------

There are a number of updates including the following:

Dates

Addresses problems with recurring meetings
  Exception repeating meetings alarms
  -48009 error when deleting exceptions to recurring meetings
Alarms for appointments on a card after reset
Removes error that indicates "styles slot is too short" in to do list

Restore

Removal of false error when starting up
A card with packages problem
Allows restore from a card with too big a backup
Restores Letter styles properly

Beaming

Fixes "Auto receive"
Multiple beams problem

Power Faults

Alleviates system sensitivity to power fluctuations on wakeup
Unit can now always turn off

Memory Management

Elimination of memory fragmentation and leaks
Increase of system memory by 32K

Time Zones	Old	New
Singapore	+7:30	+8:00
Anchorage	-10:00	-9:00
Tientsin	+8:30	+8:00
Mt. Everest	+5:30	+5:45

Word List

List now scrolls
Words that start with a capital letter can now be removed

Warm Reset

When switching folders and restarting, scrolls to the end of the notepad

Backup

Backup can be completed regardless of how full the internal memory is

Modem

Addresses out of sync wait for answer setting
Modified modem level for Japan approval

Dialing Assistant

Outgoing code for Hong Kong corrected
Corrects incorrect prefixes for Hong Kong, Singapore, and other cities

HyperCard 2.2: Stand-alone Apps Need 2MB for Color (2/94)

Revised: 2/23/94
Security: Everyone

HyperCard 2.2: Stand-alone Apps Need 2MB for Color (2/94)

==========

Article Created: 23 February 1994

TOPIC ----------

After compiling a HyperCard 2.2 stack into a stand-alone application, graphics are not displayed in color.

DISCUSSION ----------

The default memory allocation of the stand-alone application is not set high enough for the program to display graphics in color. To display color graphics, adjust the memory allocation of the stand-alone application to a minimum of 2048K.

Power Macintosh Pinouts (3/96)

Revised: 3/5/96
Security: Everyone

Power Macintosh Pinouts (3/96)

==========

Article Created: 23 February 1994
Article Reviewed/Updated: 5 March 1996

TOPIC ----------

This article presents the pinouts for non-AV Power Macintosh models. These pinouts include: ADB, GeoPort, SCSI, a floppy disk drive, built-in Ethernet, high-quality 16-bit stereo sound, and various levels of monitor support up to 21 inches, depending on the model.

DISCUSSION ----------

Apple Desktop Bus (ADB)

One connector is located on the back panel of Power Macintosh computers. It is a 4-pin mini-DIN socket.

Pin	Description
1	Data; grounded by an open collector or pulled to +5 V through 470 Ω
2	Power on, fed by +5 V through 100 kΩ; connect to pin 4 to turn on the system
3	+5 V at 500 mA maximum drain; protected by a 1.25-A circuit breaker
4	Ground return

Ethernet

All models of Power Macintosh contain built-in Ethernet.

Pin	Signal Name	Signal Description
1	FN Pwr	Power (+12V @ 2.1W or +5V @ 1.9W)
2	DI-A	Data In circuit A
3	DI-B	Data In circuit B
4	VCC	Voltage Common

5	CI-A	Control In circuit A
6	CI-B	Control In circuit B
7	+5V	+5 volts (from host)
8	+5V	Secondary +5 volts (from host)
9	DO-A	Data Out circuit A
10	DO-B	Data Out circuit B
11	VCC	Secondary Voltage Common
12	NC	Reserved
13	NC	Reserved
14	FN Pwr	Secondary +12V @ 2.1W or +5V @ 1.9W
Shell	Protective Gnd	Protective Ground

Serial Ports

The back panel of all Power Macintosh models contain two I/O ports for serial telecommunication data. Both sockets accept 9-pin plugs allowing either port to be independently programmed for asynchronous or synchronous communication formats up to 9600 bps. This includes AppleTalk and the full range of Apple GeoPort protocols.

Pin	Name	Function
1	SCLK(out)	Reset pod or get pod attention
2	Sync(in)/SCLK(in)	Serial clock from pod (up to 920 Kbit/sec.)
3	TxD-	Transmit -
4	Gnd/shield	Ground
5	RxD-	Receive -
6	TxD+	Transmit +
7	Wakeup/TxHS	Wake up CPU or do DMA handshake
8	RxD+	Receive +
9	+5 V	Power to pod (350 mA maximum)

SCSI Connection

The SCSI interface in Power Macintosh computers exists in two forms: an internal 50-pin ribbon connector for internal devices and an external DB-25 connector for external devices.

Pin Number		Description	Pin Number		Description
Internal	External		Internal	External	
1	7	Ground	2	8	/DATA0*
3	9	Ground	4	21	/DATA1
5	14	Ground	6	22	/DATA2
7	16	Ground	8	10	/DATA3
9	18	Ground	10	23	/DATA4
11	24	Ground	12	11	/DATA5
13		Ground	14	12	/DATA6
15		Ground	16	13	/DATA7
17		Ground	18	20	/DATAP
19		Ground	20		No connection
21		Ground	22		No connection

23	Ground	24		No connection
25	No connection	26	25	TERMPWR
27	Ground	28		No connection
29	Ground	30		No connection
31	Ground	32	17	/ATN
33	Ground	34		No connection
35	Ground	36	6	/BUSY
37	Ground	38	5	/ACK
39	Ground	40	4	/RST
41	Ground	42	2	/MSG
43	Ground	44	19	/SEL
45	Ground	46	15	/C/D
47	Ground	48	1	/REQ
49	Ground	50	3	/I/O

* A slash (/) before a signal name indicates that it is in the low state when active.

Floppy Disk Drive Connection

All Power Macintosh models contain one internal Apple superDrive floppy disk drive, which supports GCR and MFM formats for 1.44 MB disks.

Pin	Signal	Description	Pin	Signal	Description
1	GND	Ground	11	+5 V	+5 V
2	PH0	Phase 0 state control	12	SEL	Head select
3	GND	Ground	13	+12 V	+12 V
4	PH1	Phase 1 state control	14	/ENBL*	Drive enable
5	GND	Ground	15	+12 V	+12 V
6	PH2	Phase 2 state control	16	RD	Read data
7	GND	Ground	17	+12 V	+12 V
8	PH3	Phase 3 register write strobe	18	WR	Write data
9	NC	No connection	19	+12 V	+12 V
10	/WRREQ	Write data request	20	NC	No connection

* A slash (/) before a signal name indicates that it is in the low state when active.

AudioVision Monitor Support

The Power Macintosh computers provide connection to AudioVision (and other monitors when used with an adapter cable) by means of an AudioVision HDI-45 monitor socket on their back panel.

Pin	Description	Pin	Description
1	Analog audio ground	24	Reserved
2	Audio input shield	25	Reserved
3	Left channel audio input	26	Red ground (shield)

4	Right channel audio input	27	Red video output (75 Ω)
5	Left channel audio output	28	I^2C data signal* (I-squared)
6	Right channel audio output	29	I^2C clock signal* (I-squared)
7	Reserved	30	Reserved
8	Monitor ID sense line 1**	31	Monitor ID
9	Monitor ID sense line 2**	32	Monitor ID
10	Green ground (shield)	33	Vertical sync signal
11	Green video output (75 Ω)	34	Composite sync signal
12	Video input power ground	35	ADB power +5 V
13	Power for camera +5 V	36	ADB ground
14	Reserved	37	ADB data
15	Reserved	38	Keyboard switch
16	Reserved	39	Reserved
17	Reserved	40	Reserved
18	Monitor ID sense line 3**	41	Monitor ID
19	S-video input shield	42	Horizontal sync signal
20	S-video input luminance (Y)	43	Video sync ground
21	S-video input chroma (C)	44	Blue ground (shield)
22	Reserved	45	Blue video output (75 Ω)

* Philips serial bus interface
** See Apple Technical Note 326

VRAM Expansion Cards

VRAM expansion cards are Apple cards that plug into the PDS slots of Power Macintosh 7100/66 and 8100/88 computers. They provide an additional DB-15 monitor output.

Pin	Description	Pin	Description
1	Red ground	9	Blue video signal
2	Red video signal	10	Monitor sense 2
3	Composite synchronization	11	Synchronization ground
4	Monitor sense 0	12	Vertical synchronization
5	Green video signal	13	Blue ground
6	Green ground	14	Horizontal synchronization ground
7	Monitor sense 1	15	Horizontal synchronization
8	No connection		

Sound I/O

All Power Macintosh computers contain external stereo mini phone jacks for sound I/O, connected through amplifiers to the AWAC chip.

Panel label	Description
Audio In	8 kΩ impedance, 2 V rms maximum, 22.5 dB gain available
Audio Line Out	37 Ω impedance, 0.9 V rms maximum, attenuated -22,5 dB (crosstalk degrades from -80 to -32 dB when the audio output is connectedto 32 Ω headphones)

S-Video

Power Macintosh AV Models include S-Video In/Out jacks.

NOTE:
Non-AV Power Macintosh models do not include these S-Video In/Out jacks.

Pin	Input Connector	Output Connector
1	AGND	AGND
2	AGND	AGND
3	Video Y (luminance)	Video Y (luminance)
4	Video C (chroma)	Viceo C (chroma)
5	I^2C clock (I-squared)*	Composite Video
6	+12V at 250 mA maximum	No connection
7	1^2C data*	No connection

* Phillips serial bus

Power Macintosh AV Card Pinouts (7/94)

Revised: 7/6/94
Security: Everyone

Power Macintosh AV Card Pinouts (7/94)

==========

Article Created: 23 February 1994
Article Reviewed/Updated: 06 July 1994

TOPIC ----------

This article describes the pinouts for the Power Macintosh AV card.

DISCUSSION ----------

The AV card is an Apple expansion card that plugs into the PDS connector of any Power Macintosh computer. It contains an I/O system that handles video input and output signals, mixes video with 16-bit graphics, and supports a wide variety of Apple and third-party monitors. The AV I/O system also lets the user connect a television set as a monitor, using either NTSC or PAL format.

The AV card contains a DB-15 monitor connector output.

Here is a diagram of the pin configuration for the DB-15 monitor connector and the signals:

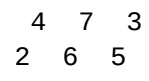
```
 8  7  6  5  4  3  2  1
  15 14 13 12 11 10 9
```

Pin	Description	Pin	Description
1	Red ground	9	Blue video signal
2	Red video signal	10	Monitor sense 2
3	Composite synchronization	11	Synchronization ground
4	Monitor sense 0	12	Vertical synchronization
5	Green video signal	13	Blue ground
6	Green ground	14	Horizontal synchronization
7	Monitor sense 1	15	Horizontal synchronization ground
8	No connection		

The AV card also contains two identical connectors for S-Video input and

output, with adapter cables for composite video devices that have RCA connectors, like television equipment.

Here is a diagram of the pin configuration for the S-Video port and the signals:



Pin	Input connector	Output connector
1	AGND	AGND
2	AGND	AGND
3	Video Y (luminance)	Video Y (luminance)
4	Video C (chroma)	Video C (chroma)
5	I^2C clock (I-squared)*	Composite video
6	+12 V at 250 mA maximum**	No connection
7	I^2C data*	No connection

* Philips serial bus
** Fused at 1.1 A

Article Change History:
06 Jul 1994 - Added diagram of pin configuration for S-Video and DB-15 ports.
24 Mar 1994 - Corrected wording.

Why Do Computer-Generated Faxes Have a Header/Footer? (2/94)

Revised: 2/23/94
Security: Everyone

Why Do Computer-Generated Faxes Have a Header/Footer? (2/94)

==========

Article Created: 10 February 1994

TOPIC ----------

When I fax a document from the fax modem from my Macintosh to a fax machine, each page has a header or footer with my name, phone number, date and time or transmission and other information.

Why is this? Can I turn this off?

DISCUSSION ----------

Federal Communications Commission regulations require that all telephone facsimile machines (including fax modems) manufactured on or after December 20, 1992, print identifying information at the top or bottom of each transmitted page. The identifying information must include the name of the sender, the date and time the fax is sent and the telephone number of the sender.

You cannot turn off this identifying information.

At Ease 2.0: GrayShare Printers Unshared on Logout (2/95)

Revised: 3/2/95
Security: Everyone

At Ease 2.0: GrayShare Printers Unshared on Logout (2/95)

==========

Article Created: 23 February 1994
Article Reviewed/Updated: 2 March 1995

TOPIC ----------

I have several Macintosh computers which are using At Ease on a LocalTalk network and are sharing a StyleWriter II. When the user of the Macintosh that is directly connected to the StyleWriter II logs out of At Ease, printer sharing quits and the printer is no longer shared across the network.

What causes this? Is there a workaround?

DISCUSSION ----------

This is a problem with At Ease 2.0. If you upgrade to At Ease v2.0.3 you do not have this problem. Under At Ease 2.0, when a user logged out all processes were terminated. This caused Printer Share to quit. When Printer Share quit, the StyleWriter II became unavailable to other computers and the "Share this printer" check box disappeared from the Choosers on the other computers.

We you install At Ease 2.0.3, Printer Share no longer quits when users log out of At Ease, so the printer is still available on the network. However, print jobs sent to the printer will be queued up to print. Printer Monitor does not launch and the acutal printing will not take place until the next user logs onto the workstation.

Article Change History:
02 Mar 1995 - Added information on At Ease 2.0.3.
29 Apr 1994 - Clarified explanation of At Ease design decision.

Super ATM: Problems After Rebuilt Desktop (2/94)

Revised: 2/25/94
Security: Everyone

Super ATM: Problems After Rebuilt Desktop (2/94)

==========

Article Created: 23 February 1994

TOPIC ----------

After I rebuilt my desktop file, some files are displayed as generic icons.

Also, some documents which previously opened, now won't open when I double click them. In the Get Info window, these icons are named "Document".

What causes this?

DISCUSSION ----------

This is caused by having Super Adobe Type Manager (ATM) loaded when you rebuilt your desktop. Adobe is aware of the problem and recommends the following workaround:

1) Turn off Super ATM and restart your system. You can do this by:

   • Turning off Super ATM from the Control Panel

   OR

   • Rebooting your Macintosh with the Shift key held down to turn Extensions off.

2) Rebuild your Desktop file by restarting your Macintosh and holding the Option and Command keys down during the startup process.

3) Turn on Super ATM and restart your Macintosh.

According to Adobe, this problem fixed in version 3.6 of Super ATM.

HSU 2.0.1: Install After System 7 Pro Install (2/94)

Revised: 2/25/94
Security: Everyone

HSU 2.0.1: Install After System 7 Pro Install (2/94)

==========

Article Created: 23 February 1994

TOPIC ----------

Should I install Hardware System Update (HSU) 2.0.1 on top of System 7 Pro?

Why?

DISCUSSION ----------

Yes, you should install HSU 2.0.1 over System 7 Pro.

The Apple Installer Script, version 1.0, REMOVES HSU if it's installed, and doesn't replace it with a new copy. Installer Script 1.0.1 fixes this problem. There are approximately 18,000 System 7 Pro copies that have Installer Script 1.0. If you suspect that HSU was removed from a system, check the Extensions folder for Hardware System Update. If it isn't there, install HSU 2.0.1 again.

The HSU that Apple Installer Script 1.0.1 installs is exactly the same as the one the Hardware System Update disk installs, except the creation date is earlier.

If you install System 7 Pro with Custom Install on a system that already has HSU 2.0.1, you'll see a dialog box which says that the existing version is newer and asking whether you want to replace it. Since the HSU files are also found in System 7 Pro and are the same except for creation date, you can either replace or leave the existing file.

System 7 Pro: Installs Older Version of Scrapbook (2/94)

Revised: 2/25/94
Security: Everyone

System 7 Pro: Installs Older Version of Scrapbook (2/94)

==========

Article Created: 23 February 1994

TOPIC ----------

Does System 7 Pro install the latest version of the Scrapbook?

DISCUSSION ----------

No, System 7 Pro installs version 7.1 of the Scrapbook desk accessory. It installs this version even though version 7.1.2 is found on the QuickTime 1.6.1 disk included with System 7 Pro.

System 7 Pro doesn't install the latest version of the Scrapbook because the current Installer script requires that you manually install the Scrapbook file to retain its contents.

Bernoulli Compatible With DOS and Macintosh (11/94)

Revised: 11/2/94
Security: Everyone

Bernoulli Compatible With DOS and Macintosh (11/94)

==========

Article Created: 24 February 1994
Article Reviewed/Updated: 2 November 1994

TOPIC ----------

Can I connect a removable cartridge drive, such as a Bernoulli drive, to both a Macintosh and IBM?

DISCUSSION ----------

Iomega Corp., the distributor of Bernoulli, distributes drives and drivers that work with both Macintosh and MS-DOS compatible computers. Check with Iomega regarding the compatibility of the product you are interested in.

After physically and logically establishing the connections, you need a utility to recognize a DOS formatted Bernoulli disk on a Macintosh, such as PC Exchange 2.0, AccessPC 3.0 from Insignia Solutions, or DOS Mounter Plus from Dayna Communications. Digital Intrumentations Technology makes a Windows product called TransferPro for Windows which reads Macintosh formatted removable media. A program called MacDisk for the PC allows MS-DOS compatible computers to read 1.4 MB Macintosh disks. So, you may wish to keep the disks and files in a DOS format, then use Macintosh utilities to access the disk.

Most Macintosh applications and their Windows or DOS counterparts can directly open and save files in the opposite platform's format. Many applications also let you read documents created with another application, but there can be some limitations. To help file translations, AccessPC 3.0 ships with some file format translators, and MacLinkPlus, a file translating application, is capable of translating hundreds of different file types.

To locate a vendor's address and phone numbers, use the vendor name as the search string.

Article Change History:
02 Nov 1995 - Added TransferPro for Windows information.

10 Oct 1994 - Added PC Exchange 2.0 to article discussion.

Power Macintosh: Install SIMMs In Same Size Pairs (2/95)

Revised: 2/15/95
Security: Everyone

Power Macintosh: Install SIMMs In Same Size Pairs (2/95)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 15 February 1995

TOPIC ----------

This article describes installing RAM SIMMs in same size pairs into a Power Macintosh.

DISCUSSION ----------

RAM for Power Macintosh computers is provided by dynamic random-access memory (DRAM) chips, of which the first 8 MB of RAM capacity is soldered to the main logic board. Users may expand RAM capacity by adding 72-pin Single Inline Memory Modules (SIMMs) of 80ns or better (for example 60ns) in pairs of 4 MB, 8 MB, 16 MB, or 32 MB in size.

For example, you may install two 8 MB SIMMs in the first two adjoining slots, additionally two 4 MB SIMMs may be added in the next two adjoining slots, and so on (no descending or ascending SIMM pair size order is necessary). SIMM pairs, of the same size and speed, must be installed in adjacent slots, but different size and speed SIMM pairs may be added to the next adjacent slots.

If you install a pair of SIMMs of different density, the Power Macintosh will assume they are both the larger size. For example if you have installed an 8 MB and a 4MB SIMM, your computer will think you have a total of 24 MB installed including the 8 MB on the logic board. In reality you would have 20 MB.

The result if an application were to try and use the additional memory that wasn't there, a system error or bomb would likely occur.

Article Change History:
15 Feb 1995 - Explained result if different density SIMM pairs are installed.

Newton MessagePad: Reducing Out Of Memory Problems (2/94)

Revised: 2/24/94
Security: Everyone

Newton MessagePad: Reducing Out Of Memory Problems (2/94)

==========

Article Created: 24 February 1994

TOPIC -----

When printing, running programs, or performing backups, I often get "out of memory" messages on my Newton MessagePad. How can I reduce this problem?

DISCUSSION -----

If you have ROM version 1.0 and System Update 1.04 or earlier, you should upgrade to the latest version of the System Update. This will help reduce "out of memory" problems because the Newton System is allocated 32K more memory.

Also, early system updates had problems displaying many bit-mapped images and often fragmented system memory. These problems do not affect MessagePads with ROM version 1.1 or later.

Here are some tips for better memory performance:

1) Remove programs that you no longer use, including programs that reside on a memory card. Each additional program, besides those located in the Newton's ROM, takes up an additional 2K of heap memory.

2) Close the Extras drawer after running any application. This will save another 3K of system memory.

3) Avoid using a large number of programs that are run continuously after installation. These programs consume large amounts of system memory and slow performance.

   You can identify these types of programs by the way they work. If you have a program that always adds a button on a particular screen or has a "floating" window that is always available, it may be a program that is always running.

4) Reset the MessagePad. This will rebuild the memory areas and remove deallocated memory which will free memory space and improve performance.

How do I remove a bookmark from a Newton "digital book"?

DISCUSSION --------------------

Digital books are Newton applications which use a book metaphor for their user interface. Newton digital books allow the user to scroll pages, mark pages with bookmarks, access data directly by page number or subject, and perform text searches.

You can place up to six bookmarks in a digital book at a time. Each additional bookmark replaces the oldest remaining bookmark. To replace an individual bookmark in a Newton digital book, you must add bookmarks until the desired bookmark is replaced. You cannot remove an individual bookmark.

Resetting your Newton will remove ALL the bookmarks.

Apple Media Tool: Macintosh Runtime System Requirements (3/95)

==========

Article Created: 24 February 1994
Article Reviewed/Updated: 1 March 1995

TOPIC ----------

What are the system requirements for Macintosh computers which are running Apple Media Tool runtime modules?

DISCUSSION ----------

Here are the system requirements:

- Macintosh computer with System 7.01
- Quicktime
- CD-ROM player (if the runtime module is distributed on CD-ROM)
- Sufficient memory to run your runtime with the "minimum allocation" memory

You can display the minimum allocation memory by selecting your runtime application in the Finder, then selecting Get Info from the File menu.

==========

Article Created: 24 February 1994
Article Reviewed/Updated: 1 March 1995

TOPIC ----------

What are the system requirements for Microsoft Windows-compatible computers which are running Apple Media Tool runtime modules?

DISCUSSION ----------

Here are the system requirements:

- Pentium- or 486-based Windows-compatible computer with Windows 3.1
- Quicktime for Windows
- Audio (or sound) card
- Windows-compatible video board capable of displaying at least 256 colors on a 640 by 480 pixel monitor
- CD-ROM player (if distributed on CD-ROM)
- Sufficient memory to display the desired runtime module

Newton Connection Kit for Windows: Connection Timeouts (2/94)

Revised: 2/24/94
Security: Everyone

Newton Connection Kit for Windows: Connection Timeouts (2/94)

==========

Article Created: 22 February 1994

TOPIC -----

When I try to synchronize my Newton MessagePad with the Newton Connection Kit for Windows, my connection to the Newton will timeout or "drop".

How can I avoid this?

DISCUSSION -----

If you try to synchronize your Newton with the Newton Connection Kit and the connection "drops" or times out, try the following steps:

1) Be sure to avoid communication port conflicts. On Windows-compatible PCs, two communications ports generally share one interrupt line. COM1 and COM3 generally share IRQ4, while COM2 and COM4 share IRQ3.

   Since you can't have more than one active device at a time on the same interrupt line, your connection will "drop" if a serial device (such as a mouse) uses the same interrupt line as the Connection Kit.

   Note that the Windows Connection Kit will try to disable any communications ports on which it finds active devices.

   Communication port conflicts can also occur if you have a fax/modem card. Fax software is generally loaded at startup and activates its communication port. If the fax/modem card uses the same interrupt as the serial port to which your Newton is connected, you won't be able to use the Connection Kit. In this case, be sure that you disable the fax software and restart your computer. To turn off your fax software, check the AUTOEXEC.BAT file or the WIN.INI LOAD= statement, remove any code that calls your fax software and restart your computer.

2) Try to synchronize again, especially if you've never synchronized your Newton before. Due to the Windows Connection Kit's speed, your

connection can "drop" while your computer is processing data. This is especially true with computers which use a 80386SX microprocessor.

Trying to synchronize again will usually get around this problem. When you synchronize your Newton and your computer for the first time, synchronization files are created. Subsequently, synchronizing will go faster because there's less data to process and the chance of a timeout lessens.

Newton MessagePad: AC Adapter Voltage Ratings (2/94)

Revised: 2/24/94
Security: Everyone

Newton MessagePad: AC Adapter Voltage Ratings (2/94)

==========

Article Created: 22 February 1994

TOPIC --------------------

Will I need a power transformer to operate my Newton MessagePad on AC power outside of the United States and Canada?

DISCUSSION --------------------

The Newton MessagePad AC adapter has the following specifications:

Voltage: 100 to 240 volts AC
Cycles: 50 to 60 Hertz

If the voltages at your destination conform to these specifications, then you need no extra transformer; the AC Adapter should handle these voltages properly. All you would need is an wall plug adapter for your destination country. This should be available in most electronic stores.

Newton MessagePad: Won't Power Off Or Sleep (2/94)

Revised: 2/24/94
Security: Everyone

Newton MessagePad: Won't Power Off Or Sleep (2/94)

==========

Article Created: 22 February 1994

TOPIC -----

My Newton MessagePad will not power off or go to sleep. What can be done?

DISCUSSION -----

If the Newton will not go to sleep, be sure that the sleep settings in Preferences are not set to the "never" setting. To check this, follow these steps:

1) Tap the Extras Drawer, then tap Preferences.

2) Tap Sleep, then tap on the diamond for Sleep settings and choose a time other than never.

If your Newton will not power off, follow these steps:

1) Reset your Newton by pressing the reset button with the tip of your stylus.

   Crashed applications or operating system tasks may prevent your Newton from powering off and a reset will restart these applications and operating system tasks.

2) If you reset your Newton and it still won't power off, remove all added applications from your Newton. Some applications may not handle the shutdown sequence properly can cause your Newton to fail to power off.

3) If the suggestions above do not work, toggle the sleep settings. Follow the instructions above for accessing the sleep settings and choose different sleep times.

Newton Connection Kit for Windows: Truncated Line Error (2/94)

Revised: 2/24/94
Security: Everyone

Newton Connection Kit for Windows: Truncated Line Error (2/94)

==========

Article Created: 22 February 1994

TOPIC -----

When I try to install the Newton Connection Kit for Windows, the error "MemReadlinefrom file - Truncated Line" occurs.

What causes this error? How do I recover from it?

DISCUSSION -----

This error occurs during installation while the Newton Connection Kit for Windows installer is reading or modifying one of the following system configuration files:

- CONFIG.SYS
- AUTOEXEC.BAT
- SYSTEM.INI
- WIN.INI

This particular error occurs if one or more lines in these files exceeds 128 characters. A future version of the Newton Connection Kit for Windows will address this installer problem.

The workaround is edit these files so each line is less than 128 characters.

You can edit these files with the Windows application SYSEDIT. To run SYSEDIT, go to the Program manager, choose Run from the File menu and execute SYSEDIT.EXE.

NCK for Macintosh: Resources Not Found Error (2/94)

Revised: 2/24/94
Security: Everyone

NCK for Macintosh: Resources Not Found Error (2/94)

==========

Article Created: 22 February 1994

TOPIC ----------

When I synchronize my Newton MessagePad with the Newton Connection Kit for Macintosh, I get the error message "certain resources are not available" and the synchronization files do not open when I try to open them.

What causes this?

DISCUSSION ----------

This error message occurs when you use the Newton Connection Kit for Macintosh with a Macintosh that does not have Color QuickDraw in ROM or if system software wasn't installed properly.

The Newton Connection Kit for Macintosh requires a Macintosh running System Software 7.01 or greater, 4 megabytes of RAM, and Color QuickDraw in ROM. The Color QuickDraw ROM has certain system resources which are required by the Connection Kit. These particular resources are not added by the System Software if they are missing from the ROM.

The following Macintosh systems do not have Color QuickDraw in ROM:

- Macintosh Plus
- Macintosh SE
- Macintosh Portable
- Macintosh Classic
- Macintosh PowerBook 100
- Macintosh II without SuperDrive (FDHD) ROM support

The packaging for the Macintosh Connection Kit states that a Macintosh SE/30 or later computer is needed. This statement is incorrect because the Macintosh Portable, Classic, and PowerBook 100 were released after the SE/30. Note that adding third-party 68030/040 accelerator boards will not add the necessary system resources.

If you have a Macintosh with Color QuickDraw in ROM and the message "certain resources are not available" occurs, follow these steps:

1) Perform a "clean install" of System 7 and choose the "Easy Install" option.

2) Reinstall the Newton Connection Kit for Macintosh.

Where to Find Apple Software Updates (02/97)

Revised: 2/6/97
Security: Everyone

Where to Find Apple Software Updates (02/97)

==========

Article Created: 24 February 1994
Article Reviewed/Updated: 06 February 1997

TOPIC -----

This article details where Apple Software Updates are posted and available for downloading.

DISCUSSION -----

Apple Software Updates include all of the latest updates of Apple software, including most printer drivers, System Enablers, updates to utilities, and networking and communication software. Customers should read the posted Apple Software License Agreement before downloading any software.

Currently, AppleAssist posts Apple Software Updates to the following online services:

1) Internet: Apple World Wide Web and ftp sites: http://www.info.apple.com
2) ftp URL: ftp://ftp.info.apple.com
2) Gopher: gopher.info.apple.com
3) America Online (keyword: applecomputer)
4) CompuServe (GO APPLE, GO APLSUP, GO APLWW)

In addition, Apple maintains a list of all available mirrors of Apple SW Updates on the Internet. This list is available using the following URL: http://support.info.apple.com/ftp/mirrors.html

Specific paths and details for each service follow:

1) America Online

Use the keyword: applecomputer to take you directly to the Apple Computer, Inc. window. Click on the software button located in the lower left side of the Apple area window to go directly to the Apple software updates collection.

2) CompuServe

Apple software updates are posted to several forums on CompuServe.

- Apple Computer Area - main window (GO APPLE) lists all Apple forums. To go to the Apple software updates collections directly, refer to one of the following GO words:

- Apple Support Forum (GO APLSUP) contains all US Apple SW Updates and information libraries.

- Apple Worldwide Software (GO APLWW) -contains localized (or worldwide) Apple Software Updates.

3) Internet: Apple Web Sites

All Apple software updates are posted to ftp servers, but you can also get to the software updates collections from one of Apple's web sites:

- http://www.info.apple.com - Get Info: Apple Support Information - Apple's USA based web site. Click on the Apple SW Updates button in the upper left corner of the home page to go to the Apple software updates collection, where you can browse for, search for and download all US and Worldwide Apple SW Updates. Here are a few handy urls:

- http://support.info.apple.com/ftp/mirrors.html -- list of newly posted Apple software updates.

- http://swupdates.info.apple.com/Architext/AT-SWupdates_USquery.html -- Search page for US Apple software updates.

- http://swupdates.info.apple.com/Architext/AT-SWupdates_Worldquery.html -- Search page for Worldwide (localized) Apple software updates.

- http://swupdates.info.apple.com/cgi-bin/lister.pl?Apple.Support.Area/Apple.Software.Updates -- Browsing page for all Apple software updates.

- http://www.support.apple.com - Takes you to the same site mentioned above.

- http://www.apple.com - Apple Computer, Inc's main home page - click on the Customer Support button in the upper left corner of the home page to go the www.info.apple.com site mentioned above.

- http://club.apple.com - Apple Club, a fee-based "diamond-lane" server, providing priority access to Apple software updates for customers in the USA and Canada. You can sign up for $19.95 per year (US) right at the site.

4) Internet: Apple ftp Sites

You can use either an ftp client (such as Fetch or Anarchie) or a web browser to go our ftp sites directly:

- ftp.info.apple.com (multiple servers, handles 2400 concurrent users - located in Austin, TX USA) When using a web browser, use the following url: ftp://ftp.info.apple.com.

- ftp.apple.com (multiple servers, handles 1000 concurrent users - located in Cupertino, CA USA) When using a web browser, use the following url: ftp://ftp.apple.com.

- ftp.info.euro.apple.com (one server, handles 250 concurrent users - located in Zeist, The Netherlands) When using a web browser, use the following url: ftp://ftp.info.euro.apple.com.

- For the latest list of other ftp sites, check the following url --http://support.info.apple.com/ftp/mirrors.html

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
06 Feb 1997 - Removed references to support.apple.com.
20 Jan 1997 - Moved the Internet options to top of the list - online services.
07 Jan 1997 - Major overhaul of article, removing AppleLink, updating AOL and CIS references and updating all Internet site information.

DISCUSSION

Apple Software Updates

Apple Software Updates is a collection of updaters, utilities, and full software installs to help keep your Apple Products running smoothly. Customers should read the posted Apple Software License Agreement before downloading any software.

- **http://asu.info.apple.com/** Search, browse, and download all English-North American and International Apple Software Updates. This web site also includes featured software updates that have recently been posted or have been identified by Apple's Response Engineers as important to our customers.
- **http://asu.info.apple.com/swupdates.nsf/Changes?OpenView&Count=50** a list of newly posted Apple software updates.

The URL listed above to the Apple Software Updates Database is the preferred method to find Apple Software Updates. However, direct access to our servers is available from the following URLs:

- **http://download.info.apple.com/** Apple's http servers located in Austin, Texas, USA.
- **ftp://ftp.info.apple.com/** Apple's ftp servers located in Austin, Texas, USA.
- **ftp://ftp.apple.com/** Apple's ftp servers located in Cupertino, CA, USA.
- **ftp://ftp.info.euro.apple.com/** Apple's ftp server located in Zeist, The Netherlands.

Tech Info Library (TIL)

The Tech Info Library (TIL) is Apple's knowledgebase with product information, technical specifications, and troubleshooting information. The TIL is updated daily and is available from the following URLs:

- **http://til.info.apple.com** Search current articles and read the latest technical information.
- **http://til.info.apple.com/tilarchive.nsf/Web+Search+Simple** Search articles covering products 8 years or older.

Apple Product-Specific Support

Apple provides support pages at **http://www.apple.com/support/** for current products that include links to:

- Product-specific software updates
- Relevant Tech Info Library articles
- Getting Started and Solving Problems informational sections
- Tech Exchange discussion boards

Fee-Based Support Options and Extended Warranty

Apple has a number of programs designed to help you get the most out of your Apple product:

- **Apple Support Line at http://support.info.apple.com/support/supportoptions/aplsupline.html** is designed for individuals and small businesses, providing convenient and affordable technical support after your 90 days of standard support expires.

- **Support Professional at http://support.info.apple.com/sp/supportpro.html** is Apple's premier technical support program specifically designed for enterprise, government, and educational computing support environments.
- **AppleCare Professional Mac OS X Server Series at http://support.info.apple.com/support/supportoptions/macosx.html** provides convenient, priority access to senior Apple technical support representatives.
- **AppleCare Professional Multimedia Series at http://support.info.apple.com/support/supportoptions/mmedia.html** provides convenient, toll-free, priority access to senior Apple technical support representatives for QuickTime, Final Cut Pro and current products based on QuickTime technologies.
- **AppleCare Extended Service at http://support.info.apple.com/support/supportoptions/applecare.html** is an extended service plan similar to the one-year limited warranty coverage that came with your Apple product when you purchased it.

Apple Spec Database

This database contains Apple product specifications collected from many sources and is available from the following URL:

- **http://www.info.apple.com/applespec/applespec.taf**

Apple Manuals

Search, browse, and download all Apple manuals and other instructional materials from the following URL:

- **http://www.info.apple.com/manuals/manuals.taf**

Performa: Checking Proper Installation of TelePort Modem (2/94)

==========

Article Created: 25 February 1994

TOPIC --------------------

Can I tell if the Global Village TelePort Bronze Modem is connected and the Global Village fax software is installed properly without sending a fax?

DISCUSSION --------------------

Yes. From the TelePort/Bronze Modem Control Panel, you can confirm proper installation of both the modem and the software.

1) Open the TelePort/Bronze control panel

2) Click the change port icon

3) Change the port by selecting the modem or printer icon that is not highlighted

If the incorrect port is selected, the volume slider bar dims. If the incorrect port is selected, switch it back by following steps 2 and 3. When the proper port is selected, you can move the volume slider bar. This indicates that the Global Village TelePort/Bronze software is installed properly, and the modem is properly connected to the Macintosh.

Newton Print Pack: Garbled Text with Canon Bubblejet (4/97)

Revised: 4/1/97
Security: Everyone

Newton Print Pack: Garbled Text with Canon Bubblejet (4/97)

==========

Article Created: 25 February 1994
Article Reviewed/Updated: 1 April 1997

TOPIC -----

When I print to my Canon Bubblejet printer from my Newton using the Newton Print Pack, the printer outputs multiple pages of garbled text. How can I get my Newton to print to the Canon Bubblejet properly?

DISCUSSION -----

The Canon Bubblejet printer is capable of several types of emulation. The printer must be set to "130e" emulation mode to print properly. In some cases, having the printer set to the wrong emulation mode can cause garbled text and multiple pages to be output.

Power Macintosh and NuBus Q&A (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh and NuBus Q&A (3/94)

==========

Article Created: 8 March 1994

TOPIC -----

Below is a Q&A series around NuBus performance on Power Macintosh.

DISCUSSION -----

Q) Is NuBus slow on the Power Macintosh family?
A) No. NuBus performance on the Power Macintosh computers is faster than any NuBus-capable Macintosh we've ever shipped except for the Quadra 840AV. And compared to the Quadra 840AV, the NuBus performance of the Power Macintosh 8100 should be about the same for most situations. When combined with new native applications, the overall performance of Power Macintosh machines is far better than any previous Macintosh.

Q) Do existing NuBus cards run on the Power Macintosh?
A) Yes. That's why we chose to stay with the NuBus expansion bus. We have found that overall NuBus compatibility is excellent. High performance cards, in areas like video and graphics, may require new software drivers in order to achieve the level of performance of the fastest Quadra Computers today.

Q) Why do customers need to get new drivers?
A) Some existing drivers depend on software APIs custom to the 68040 family. The new drivers have be rewritten around the PowerPC 601 chip instead of the 68040.

Q) How will customers get the new software drivers?
A) These new drivers will be made available by the third-party card vendors.

Q) Under what conditions is NuBus faster on the Quadra 840AV than on the Power Macintosh 8100?
A) The Quadra 840AV has the potential for block transfer reads and writes from the CPU to a slave card, whereas the Power Macintosh 8100 can only

block transfer when the card is a NuBus master. This difference is due to a special custom 68040 instruction called MOVE16, which is not implemented in the PowerPC instruction set.

Q) Why isn't the MOVE16 instruction included in the PowerPC instruction set?
A) The PowerPC processor is a Reduced Instruction Set (RISC) processor, which means that it has very simple instructions that can be executed quickly. It does not have complex instructions like MOVE16. This is what gives the PowerPC processor its great speed.

Q) Does this mean that the Quadra 840AV could be a better solution than the Power Macintosh 8100 for some customers?
A) No. The Power Macintosh 8100 combined with native Power Macintosh applications will offer performance far superior to the Quadra 840AV. We believe that the performance of native Power Macintosh applications will be 2 to 4 times faster than the same applications running on an Quadra 840AV.

Q) So NuBus performance is not an advantage of the new machines?
A) The Power Macintosh family was designed to vastly improve CPU processing performance while maintaining compatibility with today's Macintosh applications, peripherals and expansion cards. The I/O subsystems on the Power Macintosh machines, including NuBus, SCSI, networking, and so on, offer very high compatibility with today's computers and performance similar to that of the fastest Quadra Computers. The NuBus performance of the Power Macintosh machines is clearly sufficient for applications in publishing, multimedia and digital video.

Power Macintosh: New Monitor Port Uses HDI-45 Socket (7/95)

Revised: 7/11/95
Security: Everyone

Power Macintosh: New Monitor Port Uses HDI-45 Socket (7/95)

==========

Article Created: 24 February 1994
Article Reviewed/Updated: 10 July 1995

TOPIC ----------

This article describes:

• HDI-45 socket on all Power Macintosh computers

• Monitors supported through the HDI-45 socket

• DRAM supported video when using this port

• Adapter cable needed for monitors with a DB-15 plug.

DISCUSSION ----------

AllPower Macintosh 6100, 7100, 8100 computers have an HDI-45 monitor socket located on the back panel. The Power Macintosh 7100, 8100, and all designated AV models also provide a DB-15 monitor socket. In addition to the Apple AudioVision 14 monitor, the HDI-45 interface supports these other monitors when used with the HDI-45 Adaptor cable:

Monitor	Size (pixels)	Color depth (bits)
12-inch RGB	512 by 384	16
14-inch RGB	640 by 480	16
15-inch portrait	640 by 870	8
15-inch Multi-Scan	640 by 480	16
15-inch Multi-Scan	832 by 624	8
16-inch RGB	832 by 624	8
17-inch Multi-Scan	640 by 480	16
17-inch Multi-Scan	832 by 624	8
20-inch Multi-Scan	640 by 480	16
20-inch Multi-Scan	832 by 624	8
16-inch RGB	832 by 624	8

VGA	640 by 480	8

Note:
Built-in video (HDI-45 with 640K DRAM support) doesn't support any monitor with a resolution greater than 832 by 624. To use a larger monitor (19-inch, 20-inch, or 21-inch) at these higher resolutions, a third-party video card or the AV card must be used.

When using the HDI-45 connector, frame buffering for monitor support is provided through a 640K DRAM space. There is no dedicated VRAM when using this port.

A video adapter cable (Part #M2681LL/A) is needed to connect a monitor with a DB-15 connector to a HDI-45 built-in port. This cable comes standard with every Power Macintosh 6100, and is offered as an option for the Power Macintosh 6100AV. With the Power Macintosh 7100, 8100, or AV models, the adapter cable is offered as an option to connect an additional display (other than the Apple AudioVision 14) to your computer.

Article Change History:
10 Jul 1995 - Added information on Multiple Scan Displays.
09 Jan 1995 - Excluded speed from Power Macintosh model numbers.

When using to the new HDI-45 monitor port to connect my monitor, is dynamic random-access memory (DRAM) used for video buffering?

DISCUSSION -----

Yes. Frame buffering for monitor support is provided through a 640K DRAM space. The HDI-45 provides support for 16 bits on 14 inch monitors, and 8 bits on 15 inch portrait, 16 inch monitors, and VGA.

Power Macintosh: Upgrades Available (4/97)

==========

Article Created: 25 February 1994
Article Reviewed/Updated: 87 April 1997

TOPIC ----------

This article describes the Power Macintosh Upgrade Card, the Macintosh Processor Upgrade Card (discontinued), and the Power Macintosh Logic Board Upgrades.

DISCUSSION ----------

Macintosh owners who want the new high-speed capabilities of Power Macintosh computers, but don't want to sacrifice their previous investments have several upgrade options: the Power Macintosh Upgrade Card (which is no longer available from Apple Computer), the Macintosh Processor Upgrade Card (discontinued), and the Power Macintosh Logic board Upgrades.

You can install the Power Macintosh Upgrade Card (which is no longer available from Apple Computer) into the 68040 processor-direct slot of your Macintosh computer yourself by following simple, step-by-step instructions. The card adds the benefits of Power Macintosh technology to your Macintosh and provides speeds up to four times faster when using programs optimized for Power Macintosh technology. And you can still run all your existing Macintosh applications.

The Macintosh Processor Upgrade Card (discontinued) upgrades some 68040 systems with the PowerPC microprocessor. It is available for the Macintosh Quadra 605, Macintosh LC 475, Performa 47x, Macintosh LC 57x, Performa 57x, Macintosh LC 580, Performa 58x, Macintosh LC 630, Macintosh Quadra 630, and Performa 630 series of computers. Once installed, the upgrade occupies the LC-PDS slot of your Macintosh computer.

In addition, even greater performance, as well as speech and telephone capabilities, can be yours if you choose the appropriate Power Macintosh Logic Board Upgrade for your Macintosh. These logic board upgrades give your computer capabilities identical to those of the Power Macintosh model to which you've upgraded.

Installation of both the Macintosh Processor Upgrade Card and the Power Macintosh Logic Board Upgrade must be performed by an authorized Apple reseller. Your upgraded computer will retain your existing hard drive and, in most cases, your DRAM SIMMs, allowing you to take advantage of Power Macintosh capabilities and software written to take advantage of those capabilities.

The Power Macintosh Upgrade Card, the Macintosh Processor Upgrade Card, and the Power Macintosh Logic Board Upgrade give you the best of both worlds: Power Macintosh capabilities designed for the future, built on the foundation of the investment you already have in your Macintosh today.

Power Macintosh Upgrade Cards

(This product has been discontinued and is no longer available from Apple Computer.)

Begin_Table

Computer	040 speed	PowerPC 601 speed
Quadra 950	33 MHz	66 MHz
Quadra 900	25	50
Quadra 800	33	66
Quadra 700	25	50
Quadra 650	33	66
Quadra 610	25	50
Centris 650	25	50
Centris 610	20	40

End_Table

Features of Power Macintosh Upgrade Card

Power and speed
- Includes PowerPC 601 microprocessor with floating-point processor and 32K cache.
- Card runs at double the processor speed of your Macintosh computer
- Includes 1MB level-2 cache

Easy, do-it-yourself installation
- Simple, step-by-step instructions with illustrations allow you to install it yourself.
- Most installations require no tools

Compatibility
- On-board Power Macintosh ROM
- Runs programs written for Power Macintosh
- Runs Macintosh programs
- Runs MS-DOS and Windows programs (with third-party SoftWindows software)

Macintosh Processor Upgrades Available

Begin_Table

Computer	040 speed	PowerPC 601 speed
Quadra 605	25 MHz	50 MHz
Quadra 630	33	66
LC 475	25	50
LC 57X	33	66
LC 58X	33	66
LC 630	33	66
Performa 57X	33	66
Performa 58X	33	66
Performa 630	33	66

End_Table

Features of Macintosh Processor Upgrade (discontinued)

Power and speed
- Includes PowerPC 601 microprocessor with floating-point processor and 32K cache.
- PowerPC chip runs at double the processor speed of your Macintosh computer
- Includes 256K level-2 cache

Compatibility
- Macintosh System 7.5 (included)
- On-board Power Macintosh ROM
- Runs programs written for Power Macintosh
- Runs Macintosh programs
- Runs MS-DOS and Windows programs (with third-party SoftWindows software)

Logic Board Upgrades Available

The following table lists the Macintosh computers that can be upgraded to the Power Macintosh 8500 using the Power Macintosh 8500 Logic Board Upgrade (M3807LL/B) and a Power Macintosh Processor Upgrade Card (180 MHz M5458LL/A).

Begin_Table

Computer	Processor speed	PowerPC 604 speed
Quadra 800	33 MHz	180 MHz
Quadra 840AV	40	180
Workgroup Server 80	33	180
Workgroup Server 8150/80	80	180

Workgroup Server 8150/110	110	180
Power Macintosh 8100/80	80	180
Power Macintosh 8100/100	100	180
Power Macintosh 8100/110	110	180

End_Table

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Power Macintosh: Upgrade Card, Logic Board Specification (10/94)

==========

Article Created: 28 February 1994
Article Reviewed/Updated: 10 October 1994

TOPIC ----------

This article contains the specifications for the Power Macintosh Upgrade Card and Power Macintosh Logic Board Upgrades.

DISCUSSION ----------

Power Macintosh Upgrade Card technical specifications
==========

Microprocessor

- Includes PowerPC 601 RISC microprocessor
- Provides integrated floating-point processor and 32K cache
- Runs at twice the clock speed of upgraded Macintosh

Cache

- 1MB on-board level-2 cache

Installation

- User-installable in Motorola 68040 processor-direct slot of upgraded Macintosh

ROM

- Includes 4MB Power Macintosh ROM

Operating environment

- Operating temperature: 50 to 131 degrees F (10 to 55 degrees C)
- Relative humidity: 5% to 95% (non-condensing)

• Maximum altitude: 10,000 feet (3,048 meters)

Macintosh Upgrade Compatibility

Macintosh Model	6100/60 6100/60AV	7100/66 7100/66AV	8100/80 8100/80AV	Upgrade Card
Quadra 900, 950				X
Quadra 840AV			X	
Quadra 800			X	X
Quadra 700				X
Quadra or Centris 660AV	X			
Quadra or Centris 650		X		X
Quadra or Centris 610	X			X
IIvx, IIvi, or Performa 600		X		

Power Macintosh Upgrade Card Speed Comparison

Macintosh Model	68040 Speed (MHz)	Macintosh Upgrade Card Speed (MHz)
Quadra 950	33	66
Quadra 900	25	50
Quadra 800	33	66
Quadra 700	25	50
Quadra 650	33	66
Quadra 610	25	50
Centris 610	20	40

After upgrading to a Power Macintosh, your system continues to run almost all your existing Macintosh software. For best performance and greatest speed, look for the new software programs designed especially for Power Macintosh computers. You'll find Power Macintosh programs at any software store that carries products for Macintosh computers.

Ordering Information

Power Macintosh Upgrade Card*

Order No. M2843LL/A
• Power Macintosh Upgrade Card
• Necessary hardware for installation
• Complete installation instructions

Power Macintosh 6100/66 Logic Board Upgrade*

Order No. M2343LL/A
• With 8MB of RAM and Power Macintosh Display Adapter

Power Macintosh 6100/60AV Logic Board Upgrade*

Order No. M2901LL/A
• With 8MB of RAM and cable for S-video to composite video

Power Macintosh 7100/66 Logic Board Upgrade*

Order No. M2474LL/A
• With 8MB of RAM and 1MB of VRAM

Power Macintosh 7100/66AV Logic Board Upgrade*

Order No. M2840LL/A
• With 8MB of RAM, 2MB of VRAM, and S-video to composite video adapter

Power Macintosh 8100/80 Logic Board Upgrade*

Order No. M2344LL/A
• With 8MB of RAM and 2MB of VRAM

Power Macintosh 8100/80AV Logic Board Upgrade*

Order No. M2902LL/A
• With 8MB of RAM, 2MB of VRAM, and S-video to composite video adapter

* These upgrades include system software version 7; complete setup, learning, and reference documentation; as well as a limited warranty.

Internal CD-ROM Upgrades

• AppleCD 300i Plus internal CD-ROM drive: Order No. M3152LL/A
• Adapter kit for Power Macintosh 6100/60 or 6100/60AV: Order No. M2846LL/A
• Adapter kit for Power Macintosh 7100/66 or 7100/66AV: Order No. M3126LL/A
• Adapter kit for Power Macintosh 8100/80 or 8100/80AV: Order No. M2847LL/A

840AV Video Input/Output Frame Per Second Capabilities (3/94)

Revised: 3/3/94
Security: Everyone

840AV Video Input/Output Frame Per Second Capabilities (3/94)

==========

Article Created: 3 March 1994

TOPIC----------

We have a customer who is interested in using a Quadra 840AV to capture QuickTime video. He needs to know how many frames per second (FPS) he can expect from it.

DISCUSSION----------

1) How many FPS can I expect to capture without buying additional RAM using QuickTime 1.6 and 2.0? The FPS rate of QuickTime depends on a number of factors. The size of the movie, what media it is playing back from, whether or not there is audio attached to it, and which compression algorithms are used. QuickTime 2.0 will have about twice the performance at 1.6 all other things being equal. The next part of the answer depends if you want to use third-party hardware to give better performance in QuickTime. New MPEG (Motion Pictures Expert Group) hardware exists which will give up to 30FPS data rate at 640 by 480.

2) How many FPS with up to 64MB of RAM and setting up a RAM disk using QuickTime 1.6 and 2.0? You don't necessarily need to use a RAM disk to save a movie to. Some digitizing software allows you to save to RAM as a standard option. Increased memory will not improve performance, rather it allows longer recording times. Again, QuickTime 2.0 will have about twice the performance at 1.6 all other things being equal.

4) Is there any way to get the 840AV to capture video at (or very close to) 30FPS? Yes, you can get 30FPS input speed with a 840AV if the size is 320 by 240 or less and you record to RAM, or if you record frame by frame. The more RAM you have the better, more RAM simply gives you longer recording times.

5) What is the fastest rate at which video can be output from the 840AV to be recorded to a VCR? The fastest rate that you can output from the AV is similar to the fastest that the movie will play. The output is

recorded in real-time.

Lastly it depends on the frame rate that you actually need. You can do backgrounds that playback at 1FPS and smaller foreground movies that are small and playback at 30FPS.

The underlying understanding is that you have to experiment with a number of variables in making QuickTime Movies. The hardest thing to do is create movies that play back from CD-ROM. To do this you need to use MovieShop or an equivalent product which will allow you to limit the playback speed to between 90K to 190K/sec depending whether you have a single speed or double speed drive.

ARA, Express Modem, and Net Install Problem (2/94)

Revised: 3/1/94
Security: Everyone

ARA, Express Modem, and Net Install Problem (2/94)

==========

Article Created: 28 February 1994

TOPIC ----------

I'm trying to do a net install using the Apple Installer over an AppleTalk Remote Access connection. The installer keeps cutting me off after I click the install button. I have a Macintosh Quadra 840AV, I'm using a GeoPort Telecom Adapter, and AppleTalk Remote Access 1.0. I tried a net install over AppleTalk Remote Access with my Macintosh IIci and external modem and everything worked fine.

Listed below is the sequence when net install failed:

1) Connect to AppleTalk Remote Access Server.
2) Quit AppleTalk Remote Access and stay connected.
3) Launch Net Installer for CD-ROM Setup v5.0.
4) Installer Loads fine. Click Install.
5) Installer asks to quit all other applications.
6) Clicked Continue
7) AppleTalk Remote Access connection is dropped
8) Message states that server is dropped and installation cannot continue

Is there a solution? It seems there is a limitation with the Express Modem Software or GeoPort Telecom Adapter, since my Macintosh IIci worked fine with AppleTalk Remote Access and Apple Installer.

DISCUSSION ----------

We have been told that in order to change the Express Modem software, so the Installer does not shut it down, will take a lot of work and there are no current plans to do this. We have submitted this as an enhancement request.

We came up with two similar workarounds that still require downloading the software, then doing the install, but at least they do not require any additional equipment:

- Depending on the amount of software that must be downloaded and the amount of RAM installed on your computer, you could create a RAM disk to copy the software into, disconnect and quit ARA, then run the installation. The RAM disk still appears if you then restart with the Shift key down to disable extensions. This will increase the amount of RAM available for the Installer to run in. We successfully downloaded Microsoft Mail and installed it using a RAM disk on a computer with 4MB of RAM.

- The RAM disk method isn't likely to work with a huge program like Word or Excel. We used disk partition software that comes with Norton Utilities. We created a couple of partitions on our hard drive and copied the software into them. The nice thing about these kind of partitions is they can be created and deleted on the fly. Although we didn't perform extensive testing, this method also appeared to work.

LaserWriter Select 360: Creating Fax Groups (3/94)

Revised: 3/3/94
Security: Everyone

LaserWriter Select 360: Creating Fax Groups (3/94)

==========

Article Created: 2 March 1994

TOPIC ----------

Can I create several group lists with the Phone Book Utility?

DISCUSSION ----------

Yes, the LaserWriter driver 8f comes with a Phone Book utility that allows you to create a list of fax recipients. In addition to individual recipients it is quite easy to create a group of individuals that a fax will be sent to.

LaserWriter Select 360: Cannot Force Fax Connection (3/94)

Revised: 3/3/94
Security: Everyone

LaserWriter Select 360: Cannot Force Fax Connection (3/94)

==========

Article Created: 3 March 1994

TOPIC ----------

When trying send a fax to someone with a voice/fax/data switch the LaserWriter Select 360 fax software does not send the fax. It appears to be waiting for a fax to answer the phone. Is there a way to force the fax modem to go ahead and send the document?

DISCUSSION ----------

There is no way to force fax modems to go ahead and send documents. This is because data handshaking, and optionally error correction, need to be established. The LaserWriter Select 360 fax modem operates as a standard Group 3 fax machine so it's communications are no different, just the type of data being sent.

Historically voice/fax/data switches have not been too robust in making the appropriate connections. So, we would suggest contacting the manufacturer of the switch for additional help in troubleshooting the switch. We have heard that some switches can be configurable so it might help to adjust those settings.

Color StyleWriter Pro: Meaning of Error LEDs (4/97)

Revised: 4/2/97
Security: Everyone

Color StyleWriter Pro: Meaning of Error LEDs (4/97)

==========

Article Created: 01 March 1994
Article Reviewed/Updated: 02 April 1997

TOPIC ----------

When the printer has a problem what do the various LEDs mean?

DISCUSSION ----------

The Error and Power LEDs are not visable when the top cover is closed. When the top cover is open they can be seen, as well as the cartridge (black, cyan, magenta, yellow) LEDs.

LED Status

ERROR	Power	Black	Cyan	Magenta	Yellow	Cause
ON	ON	OFF	OFF	OFF	OFF	Paper empty/Jam
ON	ON	OFF	OFF	OFF	ON	Check printer for leaks
ON	ON	One or more LEDs Blinking				Cartridge out of ink
Blinking	ON	All cartridge LEDs Blinking				Printhead error

(Sometimes the printhead cover not fully latched. Push down on cover.)

Begin_Table

The following errors require the printer be serviced.

Blinking	ON	OFF	OFF	OFF	ON	Recovery error*
Blinking	ON	OFF	OFF	ON	OFF	Home Position Error
Blinking	ON	OFF	OFF	ON	ON	Linear Encoder Error
Blinking	ON	OFF	ON	OFF	OFF	Cleaning Sensor Error

Blinking	ON	OFF	ON	OFF	ON	Paper Feed Motor
Blinking	ON	OFF	ON	ON	OFF	Sheet Feeder Sensor
Blinking	ON	OFF	OFF	OFF	ON	Thermistor Error
Blinking	ON	ON	OFF	OFF	OFF	ROM Error
Blinking	ON	ON	OFF	OFF	ON	Memory Error (printer)
Blinking	ON	ON	OFF	ON	OFF	Ink Absorber Full
Blinking	ON	ON	OFF	ON	ON	EEPROM Error
Blinking	ON	ON	ON	OFF	OFF	Gate array Error

End_Table

NOTE: When you encounter a Recovery error, check and reinstall the purge unit first. This usually corrects this error.

If the error lights on the Color StyleWriter Pro indicating service is needed, you can first try resetting the printer to correct the problem. If resetting the printer doesn't correct the problem, it needs to be serviced.

Resetting the Color StyleWriter Pro
---

1) Disconnect the power cord from the Color StyleWriter Pro while it is still on.

2)Open printer and remove all four ink cartridges.

3)Open Print Head case and remove the print head.

4)Wait 1-2 minutes.

5)Replace print head and make sure that the lid for the print head snaps twice locking it down.

6)Replace all four ink cartridges, making sure that they snap into place.

7) Wait a few seconds, then reinsert the power cord into the printer.

Once the power cord is reconnected to the printer, it should print a calibration page. If it doesn't, use the Utilities option in the print dialog box to print a calibration page.

Article Change History:
04 Sep 1996 - Added note about purge unit.
10 Nov 1994 - Added information on resetting the printer.
02 Apr 1997 - Revised the reset procedure.

Color StyleWriter Pro: Improperly Installed Ink Cartridge (3/94)

==========

Article Created: 1 March 1994

TOPIC ----------

When changing ink cartridges, for the Color StyleWriter Pro, I switched two of the colors. How can fix this problem?

DISCUSSION ----------

1) Put all cartridges in their correct position
2) Turn the printer on
3) Choose PRINT DESKTOP from the 'File' pulldown menu
4) Open the UTILITIES box in the Print dialog
5) Select 'Clean print head before printing'
6) Select 'All Colors'

This cleans the print heads and corrects the problem.

Color StyleWriter Pro: Avoiding Marks On Transparencies (3/94)

Revised: 3/3/94
Security: Everyone

Color StyleWriter Pro: Avoiding Marks On Transparencies (3/94)

==========

Article Created: 3 March 1994

TOPIC ----------

When printing transparencies, I occasionally see a 0.5 in. x 2 in. rectangle mark on the edge that is fed in first. It is more apparent when a color or shaded background is used. How can I prevent this from occurring?

DISCUSSION ----------

The marks are caused by the sheet feed rollers. The marks are virtually invisible when the transparency is placed on an overhead projector. However, to avoid the marks altogether the following procedure is recommended:

1) Empty the sheet feeder

2) Move the paper load lever to the envelope position

3) Make sure printer is turned on

4) Insert the transparency into the sheet feeder, as normal

5) Load the transparency manually by adjusting the transparency so that the leading edge drops down into the printer about 1.25 in.

6) Start the print job. If printing a multi-page document, the printer attempts to automatically feed sheets for pages after the first page. To prevent this, print each page separately using the From: To: option in the Print dialog box.

Color StyleWriter Pro: Initial Startup time (3/94)

Revised: 3/3/94
Security: Everyone

Color StyleWriter Pro: Initial Startup time (3/94)

==========

Article Created: 2 March 1994

TOPIC -----

The first time I turned on my Color StyleWriter Pro, it took about 6 minutes before it was ready to use. Is this normal?

DISCUSSION -----

Yes, this is normal the frist time the printer is turned on. The next time it should be ready in about two minutes or less. The initial startup cycle is called refreshing the printer. During this operation each color head is cleaned and wiped twice and the jets are cleaned of air bubbles that may developed in shipping. The process uses about 0.47 grams of ink per cartridge or 5.9%.

Power Macintosh: L1 and L2 Cache Explained (4/97)

Revised: 4/24/97
Security: Everyone

Power Macintosh: L1 and L2 Cache Explained (4/97)

==========

Article Created: 28 February 1994
Article Reviewed/Updated: 24 April 1997

TOPIC -----

What are the differences between Level 1 and Level 2 cache on the Power Macintosh computers? Do all Power Macintosh computers use the same type of L2 cache?

DISCUSSION -----

Level 1 Cache
==========
Level 1 Cache consists of high speed memory built into the PowerPC processor. By using this cache, the processor can access frequently-requested data more quickly. The amount of Level 1 cache varies among the PowerPC chips, and you cannot upgrade it.

The PowerPC 601 microprocessor and the PowerPC 604 microprocessor both have 32K internal cache. However, the PowerPC 601 microprocessor has a single 32K cache for both instructions and data, whereas the PowerPC 604 has two 16K sections, one for instructions and one for data. The PowerPC 604e microprocessor has 64K cache, which consists of two 32K sections, one each for instructions and data.

Begin_Table

Computer	L1 Cache
Power Macintosh 4400 series	32K
Power Macintosh 5200/75 & Performa 5200 Series	16K
Power Macintosh 5260/100, 5300/100 & Performa 5300 Series	32K
Power Macintosh 5400 Series	32K
Power Macintosh 5500 Series	32K
Macintosh Performa 6200 Series	16K
Macintosh Performa 6290CD and 6300 Series	32K
Macintosh Performa 6360/160	32K

Power Macintosh & Performa 6400 Series	32K
Power Macintosh 6500 Series	32K
Power Macintosh & Performa 6100 Series	32K
Power Macintosh 7100 Series	32K
Power Macintosh 8100 Series	32K
Power Macintosh 7200 Series	32K
Power Macintosh 7300 Series	64K
Power Macintosh 7500/100	32K
Power Macintosh 7600/120 and /132	32K
Power Macintosh 7600/200	64K
Power Macintosh 8500/120	32K
Power Macintosh 8500/132	32K
Power Macintosh 8500/150	32K
Power Macintosh 8500/180	64K
Power Macintosh 8600/200	64K
Power Macintosh 9500/120	32K
Power Macintosh 9500/132	32K
Power Macintosh 9500/150	32K
Power Macintosh 9500/180MP	64K
Power Macintosh 9500/200	64K
Power Macintosh 9600/200	64K
Power Macintosh 9600/200MP	64K

End_Table

Level 2 Cache

Level 2 Cache is separate from the processor and it is typically upgradeable. The Level 2 cache works in conjunction with the microprocessor's internal cache to provide maximum performance. The total amount of supported Level 2 Cache also varies from computer.

Performance Benefits

* Native PowerPC Software

You see the greatest performance improvement in tightly written native PowerPC software where code is kept close to the microprocessor.

* Non-Native Software

You will likely see marginal or no performance improvements running software applications written for 68000-series microprocessors.

PowerPC Microprocessors

The reason for performance increases with the addition of L2 cache is the PowerPC microprocessor can keep its pipeline full, allowing for faster and more efficient processing. The microprocessor first checks its internal cache, then L2 cache, and finally main memory (DRAM) for instructions. Because cache memory

is faster than DRAM, it can be accessed more quickly, thus helping keep the pipeline full.

This also accounts for the lack of uniform performance improvements. Tight code will stay near the processor and run faster, while other code may not. In general, you can expect a 10-15% performance improvement with code that benefits from L2 cache.

Power Macintosh Models

The Nubus-based Power Macintosh computers (which include the 6100, 7100, and 8100 series) and the PCI-based Power Macintosh computers (which include the 7200, 7500, 8500, and 9500 series) do not use the same type of L2 cache.

* Power Macintosh 6100, 7100, and 8100

The 6100, 7100 and 8100 Power Macintosh models accept an external L2 cache on a Single Inline Memory Module (SIMM). The Power Macintosh 8100/80 shipped with 256K L2 cache already installed; users of Power Macintosh 6100/60, 6100/60AV, 7100/66, and 7100/66AV can install a L2 cache by installing the appropriate cache SIMM into the 160-pin connector on the main logic board.

The Power Macintosh 6100/66, 7100/80, 8100/100, and 8100/110 computers ship with 256K L2 cache memory installed.

* Power Macintosh 7200, 7300, 7500, 7600, 8500, 8600, 9500, and 9600

The Power Macintosh 7200, 7300, 7500, 7600, 8500, and 8600 series all support L2 cache 160-pin Dual Inline Memory Modules (DIMMs). The cache can be increased by adding L2 cache DIMMs to the expansion slot(s) on the logic board.

The Power Macintosh 7200/75, 7200/90, 7200/120 (8 MB configuration), and the 7500 series computers ship with no L2 cache DIMM installed.

The Power Macintosh 7200/120 (16 MB configurations), 7300 series, 7600 series, 8500 series, and the 8600 series include a 256K L2 cache DIMM installed. The Power Macintosh 7200 is theoretically expandable to 1 MB, while the 7300, 7500, 7600, 8500, and 8600 series computers are theoretically expandable to 4 MB, but those configurations have not been tested and are not supported by Apple.

The Power Macintosh 9500 and 9600 series computers ship with 512K L2 cache memory soldered to the logic board. The Power Macintosh 9500 and 9600 series computers do not have a DIMM socket for adding additional L2 cache memory, and therefore are not expandable beyond 512K.

Begin_Table

Power Macintosh Series	L2 Cache Included	Cache Type	Supported Cache SIMM/ DIMM Sizes	Maximum Total Cache

4400	256K (optional on some configurations)	160-pin DIMM	256K	256K
5200	256K	On logic board	N/A	256K
5260	OPTIONAL	160-pin SIMM	256K	256K

9500 Series	512K	On logic board	N/A	512K
9600 Series	512K	On logic board	N/A	512K

End_Table

Notes

Apple does not sell cache modules larger than 256K.

Apple does not support cache modules larger than 256K.

*These computers theoretically support 512K and 1 MB of L2 cache, but these configurations have not been tested and are not supported by Apple.

** These computers support a theoretical limit of 4 MB of L2 cache, but this has not been tested and is not supported by Apple.

The Power Macintosh 7200/120 configuration with 8 MB of memory does NOT include the L2 Cache DIMM.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

This article was published in the Information Alley on 7 August 1996.

Language Kits and Printing Errors (6/95)

==========

Article Created 2 March 1994
Article Reviewed/Updated: 26 June 1995

TOPIC ----------

I have problems printing from either the Japanese Language Kit (JLK) or the Chinese Language Kit (CLK) using the LaserWriter driver 8.1.1 to an Apple LaserWriter printer.

DISCUSSION ----------

Question: If I try to print in black and white with print options "Summarize PostScript errors on screen" and "Cover Page Before" enabled, I get a Type 4 error.

This error can be reproduced by printing from TeachText-J (TeachText Japanese) on any Macintosh with 7.1, JLK, and LaserWriter 8.1.1 installed.

NOTE:
This error does not occur when printing in "Color/Grayscale" or "Color/Calibrated Grayscale".

Answer: The Japanese Language Kit employs the "InputBackSupport" extension to support non-TrueType Japanese fonts. TeachText Japanese defaults to the non-TrueType font "Osaka" to display and print Japanese text.

The Japanese Language Kit Update contains a newer version of the "InputBackSupport" extension which provides System 7.5 compatibility and corrects problems associated with printing, including the "Type 4" problem described above. This update is available online or by calling Apple directly.

Question: We are using the Japanese Language Kit and whenever we print to any of our LaserWriters (such as, a LaserWriter IIg, LaserWriter Pro 630, or LaserWriter Pro 810), one of two things happen:

- Our machine freezes.
- Blank pages are printed.

This problem occurs from a variety of applications such as TeachText-J, and FileMaker Pro-J. We also loaded the InputBackSupport file from the Chinese Language Kit, and the problem still occurs.

Answer: This is a known issue with LaserWriter driver 8.0 and 8.1.1 which is resolved by installing LaserWriter 8.2. LaserWriter 8.2 is included in System 7.5 Update 1.0. The latest version of the LaserWriter driver, 8.3, is now available for downloading from on-line services.

Power Macintosh and ApplePhone Are Not Compatible (3/94)

==========

Article Created: 1 March 1994

TOPIC -----

I just installed the GeoPort Telecom Adapter Express Modem software and ApplePhone application on my Power Macintosh. I now get a message that says it's not supported on this hardware. Why?

DISCUSSION -----

ApplePhone accesses the Macintosh 660AV and 840AV computers Digital Signal Processor (DSP) directly. The Power Macintosh AV computers do not have a DSP, resulting in ApplePhone software not running.

Newton Connection Kit Timeout Troubleshooting

Revised: 3/2/94
Security: Everyone

Newton Connection Kit Timeout Troubleshooting

==========

Article Created: 2 March 94

TOPIC -----

When using the Newton Connection Kit for Macintosh or Windows, the connection fails during synchronization with a timeout error such as "Error -1", "Error -4", or "Connection Failed." Previous synchronizations were successful so I know the hardware configuration is correct. What can be done?

DISCUSSION -----

Occasionally certain applications and data added to the MessagePad cannot be backed up properly. The MessagePad or computer may take too long to process the information and will drop the connection. Pay attention to the progress window during synchronization. The windows will show which piece of data is being synchronized. When the sync fails, you should have an idea of what application or data may be causing the problem.

Try the following steps:

- Reset the MessagePad

- Remove applications from the MessagePad or RAM card and try to synchronize again. Contact the publishers of applications found to be causing the problem.

- Move the synchronization files to another folder or directory on the disk and resync. The resync will create new files from scratch.

Sometimes corrupt or uncompacted synchronization files can cause the problem. Copy and paste data from the old sync files to the new sync files then resynchronize to transfer data to the MessagePad.

Macintosh TV Remote doesn’t work after power on

Revised: 3/2/94
Security: Everyone

Macintosh TV Remote doesn’t work after power on

==========

Article Created: 2 March 94

TOPIC -----

The remote control for my Macintosh TV will power up the computer but does not provide any control of the unit after that. The replacement remote has the same symptoms.

DISCUSSION -----

To resolve this problem you need to reset the Parameter RAM (PRAM) by holding down the Command, Option, P, and R keys while starting up your computer. Your Macintosh TV will sound its normal startup chord twice. After the second chord you can release the keys you are holding down. Your remote control should now be functional in controlling your Macintosh TV.

Power Macintosh: VRAM SIMMs are Different (1/95)

Revised: 1/19/95
Security: Everyone

Power Macintosh: VRAM SIMMs are Different (1/95)

==========

Article Created: 1 March 1994
Article Reviewed/Updated: 19 January 1995

TOPIC ----------

This article describes the importance of installing VRAM SIMMs into the correct Power Macintosh. The VRAM SIMMs for the Power Macintosh 7100 are different from the VRAM SIMMs for the Power Macintosh 8100.

DISCUSSION ----------

Because the SIMMs for the Power Macintosh 7100 and 8100 VRAM Expansion Cards have the same pin assignments and external dimensions, they may inadvertently be switched between computers. If a switch happens, the additional VRAM may not be recognized, or strange video activity may occur. Be sure the proper VRAM SIMMs are installed.

The SIMMs can be differentiated by sight. SIMMs for the Power Macintosh 7100 have two chips per SIMM, while SIMMs for the Power Macintosh 8100 have four chips per SIMM.

Note that this information is applicable to Apple SIMMs only, third party SIMMs may be different in chip count. Be sure to check with your SIMM vendor or installing dealer as to the compatibility of the VRAM SIMMs prior to installation.

Article Change History:
19 Jan 1995 - Noted that identification method is for Apple SIMMs only.
11 Jan 1995 - Updated for all Power Macintosh 7100 and 8100 models.

Article Created: 4 March 1994
Article Reviewed/Updated: 10 October 1994

TOPIC -----

This article describes the functions and capabilities of the Newton MessagePad 110.

DISCUSSION -----

MessagePad 110 Features
==========

New Industrial Design

The MessagePad 110 is a completely new industrial design – slightly longer and narrower than the original to accommodate a better grip. It includes a flip-top cover that folds out of the way when in use, and flips closed to protect the MessagePad’s screen when the Newton is off or charging.

Memory

The MessagePad 110 memory has been expanded to 1MB with about 480K available for user storage. Users should expect to be able to store about 600 recognized notes, 750 names, 1500 appointments, and 100 notes in digital ink.

Battery Life

The MessagePad 110’s design accommodates AA-type batteries, which increases the battery life to up to 50 hours of use when using alkaline batteries and up to 20 hours when using NICD batteries. The implementation of type AA batteries also brings the MessagePad 110 into a range of common electronic devices that use this battery size. With the optional MessagePad 110 Recharger, the Newton can

recharge a battery pack in about two hours.

Screen and Stylus

The MessagePad 110’s screen is 16 pixels shorter than the original MessagePad. Software titles that were written to adjust to variable screen sizes should not experience any trouble when used on the MessagePad 110. Titles that do not adjust to variable screen sizes may not work properly with the MessagePad 110. A new, round stylus is also included which may make writing more comfortable for some users.

Manual and Video

A revised manual and video is included for all MessagePad 110 customers.

Improved Recognition Capabilities

The Newton Intelligence Operating System included in the MessagePad 110 ROM supports two new features which enhance handwriting recognition. An improved letter-by-letter recognition feature allows users to write words that are not in Newton’s dictionary yet Newton will recognize them. Another new feature called deferred recognition allows users to take notes in digital ink and return to the note and recognize them later. Newton users now also have the option of adding the names, street names, and cities they enter into the Names application of Newton’s dictionary.

Compatibility

The MessagePad 110 can share data with any other device based on Newton Intelligence, including the original MessagePad. Applications written for the Newton OS which adjust for variable screen sizes are compatible with the 110. Those that do not adjust for variable screen sizes may not work properly.

Technical Comparison

ASPECT	MessagePad 110	MessagePad 100
Power Supply	4 Type AA batteries	4 Type AAA batteries
Estimated Average Battery Life:		
• Alkaline batteries	40-50 hours	10-28 hours
• NICD batteries	15-20 hours	4-12 hours
Enclosure	Flip-open cover	Carrying case
RAM/User Space	1024K / 4800K	640K / 150K

Screen Size (pixels)	240 x 320	240 x 336
Pen	Telescopic round	Flat
Size	8" x 4" x 1.25"	7.25" x 4.5" x 0.75"
Weight (with batteries)	1.28 lbs	0.9 lbs
Infrared Transfer Rate (at one meter)	Up to 38.4 Kbps	Up to 38.4 Kbps

Newton MessagePad 110: Specifications (12/94)

==========

Article Created: 4 March 1994
Article Reviewed/Updated: 14 December 1994

TOPIC ----------

This article discusses the technical specifications of the Newton MessagePad 110.

DISCUSSION ----------

Newton Recognition Architecture

- Recognizes handwriting: printed, cursive, or mixed-word recognition
- Recognizes writing letter-by-letter or word-by-word
- Recognizes graphics and the inherent symmetry in objects
- Allows deferred recognition; can store notes in handwritten for later recognition

Newton Information Architecture

- Object-oriented data storage optimized for storing, finding, and linking small pieces of information
- Easy creation of custom forms applications via the flexible graphical view Toolbox
- Easy data sharing using standard tags
- Object-oriented database provides flexible view of data

Newton Communications Architecture

- Provides single interface for all communication services
- Integrated to support easy communications with minimum setup requirements
- Designed in modules to support new communications capabilities

Intelligent Assistance Architecture

- Assists users in completing repetitive tasks done in multiple categories,

including communications, scheduling, finding, and reminding functions
• Contains smart defaults to reduce complexity
• Functions across applications transparently
• Allows extensions by third-party developers

Newton Hardware Architecture

• ARM 610 processor at 20 MHz
• Apple custom system ASIC
• Low-power, reflective LCD display (336 x 240 pixels)
• Transparent tablet with round telescopic pen
• 4MB of ROM
• 1MB of RAM
• One PCMCIA Type 2 card slot
• LocalTalk-compatible serial port
• Low-power, half-duplex, infrared transceiver (up to 38.4 kilo bits per second (kbps) at 1 meter)
• Protective screen lid

Communications Capabilities

• Print to Apple LaserWriters and StyleWriters with serial cable and to popular parallel printers using Newton Print Pack
• Fax with optional fax modem (9600 baud fax send, automatic cover-page generation, post-formatting)
• Send notes, name cards and appointments at up to 38.4 kbps within 1-meter (3.28 feet) using high-speed “beaming” via infrared technology
• Handle telephony needs with assistance for intelligent auto dialing (DTMF or modem dialing)
• Receive and store wireless messages using optional Messaging Card
• Use NewtonMail* to exchange electronic mail with other Newton MessagePad users, as well as with Windows-based and Macintosh computer users with an optional modem
* This service may not be available in all countries

Size and Weight

• Height: 8 in. (202 mm)
• Width: 4 in. (106 mm)
• Depth: 1.25 in. (33 mm)
• Weight: 1.28 lb. (.59 kg)

Operating Environment

• Temperature: 32 degrees to 104 degrees Fahrenheit (+0 to +40 degrees Celsius)
• Storage temperature: -4 to 117 degrees Fahrenheit (-20 to +60 degrees Celsius)
• Relative Humidity: 20 percent to 90 percent noncondensing

Power Requirements

• Power adapter:

    -- Universal, 100 to 240 VAC, 50/60 Hz
    -- Four plug configurations: U.S., U.K., Europe, and Australia
- Battery type: alkaline or nickel-cadmium
    -- Alkaline output: 6.0V DC, 1.1 WH (nominal)
    -- Nickel-cadmium output: 6.0V DC, 800 mAh (nominal)
- Lithium cell: DL2032
- Operating range: 3 V (nominal)
- Power source: Four AA batteries (included), optional AC adapter, optional Rechargeable Nickel-cadmium Battery Pack

Connecting Kit System Requirements

- Works with personal computers running Microsoft Windows 3.0 or later, using the Newton Connection Kit for Windows
- Works with Macintosh personal computers running system software version 7.1 or later, using the Newton Connection Kit for Macintosh

Printer Support

- Built-in printer support for the Apple StyleWriter and StyleWriter II, Personal LaserWriter LS and Personal LaserWriter 300 printers, and Apple PostScript laser printers from the LaserWriter Plus and up
- Works with most popular PC printers, including the Hewlett-Packard LaserJet, Hewlett-Packard DeskJet, Canon BubbleJet, and Epson LQ and FX using the Newton Print Pack option

Fax Machine Support

- Supports Group 3 fax machines

Article Change History:
14 Dec 1994 - Corrected the metric weight
09 Mar 1994 - Corrected power source to say four AA batteries, not AAA.

PostScript Fax Card: Limited Security For Incoming Faxes (3/94)

Revised: 3/7/94
Security: Everyone

PostScript Fax Card: Limited Security For Incoming Faxes (3/94)

==========

Article Created: 7 March 1994

TOPIC ----------

Are there any security options available for the optional PostScript Fax card when sending and receiving Faxes?

DISCUSSION ----------

The only security option we are aware of for the LaserWriter Pro 810 and LaserWriter Select 360 fax card is through setting a Fax Postscript password on your printer for incoming fax jobs. This works only with incoming faxes. Setting up a password is done with the LaserWriter Fax Utility that is automatically installed with the fax software.

Setting Passwords

The password can be set by choosing the Incoming Fax Settings menu item under the Configuration menu. Once this is set, people wishing to fax to your printer must type in the Fax PostScript password in one of two places:

1) The PostScript password field in the Options dialog when they are selecting a fax destination.

2) The PostScript password field when setting up entries in their fax phone book.

Deleting Passwords

To delete any passwords you have set for the printer, leave the Fax PostScript Password field blank in the Incoming Fax Settings menu and close the dialog. This clears out any stored password.

LaserWriter Utility 7.6.1 and 7.7: Grayed out options (3/94)

Revised: 3/23/95
Security: Everyone

LaserWriter Utility 7.6.1 and 7.7: Grayed out options (3/94)

==========

Article Created: 7 March 1994
Article Reviewed/Updated: 23 March 1995

TOPIC----------

A customer is trying to use the Power Saving option in the Laserwriter Utility. When the customer goes into Laserwriter utility 7.7, several of the utility's features are grayed out, including Power Saving. The customer is using a LaserWriter Pro 810 and has a fax card in the printer. If the customer takes out the fax card, then some of the options in the LaserWriter Utility's menu come back.

As a test, I used Laserwriter Utility 7.7 with our printer (a LaserWriter 16/600 PS) and had the same options grayed out.

DISCUSSION ----------

There was a similar previous issue with LaserWriter Utility 7.6.1, but ONLY when using it with the LaserWriter Pro 810f printer. Unfortunately, LaserWriter Utility 7.7 was based on LaserWriter Utility 7.6.1 so the same type of problem occurs. Please note that you will not be able to select "Power Saving", however, since the 810 DOES NOT have this capability.

With regard to the same problem happening on a LaserWriter 16/600 PS, the LaserWriter Utility 7.7 probably does not know about this new printer. Thus, the same problem (as in LW Utility 7.6.1) occurs where the Utility does not have the LaserWriter 16/600 PS with or without fax in its product list, and has disabled menu items since it knows nothing about the printer.

The bottom line is that customers should use one of the following:

- The new Apple Printer Utility for the LaserWriter 16/600 PS

- LaserWriter Utility 7.6.2 if they have a LaserWriter Pro 810

- LaserWriter Utility 7.7 if they are running GX

Security: Everyone

LaserWriter Pro 630: No Tray Switching With Windows (3/94)

==========

Article Created: 21 March 1994

TOPIC -----

Is there a way to specify which tray to use for the first page, and a different tray for the remaining pages of the print job with a LaserWriter Pro 630 using Windows?

DISCUSSION -----

The ability to control tray selection for the "first" and "remaining" pages is a feature of PostScript level 2. The current Windows driver being distributed by Microsoft (PScript.drv v3.5x) is only a PostScript level 1 driver.

We believe Adobe sells a Windows version of their PS Printer driver which is a PostScript level 2 driver. You may want to verify with Adobe that their driver supports this specific feature you are looking for.

Macintosh LC Family: Replacement Battery Alternatives (5/96)

Revised: 5/8/96
Security: Everyone

Macintosh LC Family: Replacement Battery Alternatives (5/96)

==========

Article Created: 3 March 94
Article Reviewed/Updated: 8 May 1996

TOPIC ----------

Are there specific brands and model numbers of batteries that can serve as replacements for the LC battery? The Apple part number, 742-0011, is sometimes in short supply.

DISCUSSION ----------

Several Macintosh computers* use the same 1/2AA 3.6-3.9V lithium battery that powers the clock chip after the computer is shut down. It has a life span of approximately 7 years and should be replaced when the clock begins to lose accuracy or when the contents of the parameter RAM are not maintained after powering down the system.

Consult your user manual or the Service Source CD for replacement instructions. This battery is NOT replaceable by the user.

There are altenative sources for the batteries. For example, this part may be available through Sun Remarketing at 800-821-3221.

In addition, computer stores may have the kind of batteries you'll need; below is a list of replacement batteries:

Hitachi Maxell	#ER3S
ELECTROCHEM	#3B26
ETERNACELL	#T04/41
TADIRAN	#TL-2150, TL-5101
VARTA	#VL1/2AA

*Note: This includes the following Macintosh computers: Macintosh LC, LC II, LC III, LC 475, LC 520, LC 550, Performa 400, 405, 410, 430, 450, 460, 466, 467, 475, 476, 550, 560, Color Classic, and Quadra 605.

LW Select 360 & Pro 810: Documents Are Faxed Not Printed (10/94)

Revised: 10/12/94
Security: Everyone

LW Select 360 & Pro 810: Documents Are Faxed Not Printed (10/94)

==========

Article Created: 7 March 1994
Article Reviewed/Updated: 12 October 1994

TOPIC ----------

We have a LaserWriter Select 360, with the Fax option, and sometimes our documents are Faxed instead of printed. Can I correct this? Does this problem also apply to the LaserWriter Pro 810, with the Fax option? Are there any updates that fix this?

DISCUSSION ----------

This is actually a two-part problem and occurs on both the LaserWriter Select 360 as well as the LaserWriter Pro 810, when both have the Fax option cards. The first part of this problem is that there are some applications that bypass the Print dialog box, and so the destination of the print job (printer, file, or fax) is indeterminate.

Without the Print dialog, you are unable to select the appropriate destination (fax, printer, or file), so you cannot determine where the job is being sent. There are no rules as to which destination takes priority, but typically the job is sent to the previous destination stored in the driver.

NOTE: This varies with versions of the LaserWriter Driver.

We strongly recommend using the Apple Print dialog (rather than the application's Print dialog) whenever possible, otherwise the destination of the job is questionable. Check the application’s user’s guide for instructions on using Apple’s Print dialog. We are currently aware of a few applications that allow a bypass of the Print dialog, these include:

- AppleLink
- Microsoft Excel
- HyperCard
- PageMaker

The second part of the problem is that LaserWriter 8.0 and 8.1.1 have a "sticky" destination feature. Basically, the driver maintains the last selected destination and uses that destination for any future jobs, until a different destination is chosen. Engineering has acknowledged that this can cause potential problems, so they are modifying the next revision of the driver to be "non-sticky" and have it always default to "printer".

In addition to the two possible "causes" of this problem (i.e. no print dialog, and the driver's "sticky" destination), some applications don't make the required calls to certain Print Manager routines when they bypass the Print dialog.

We have determined that in these cases, the application does not make the Print Manager call to PrintDefault, which provides the default values for the printing record. PrintDefault MUST be called if the Page Setup or Print dialogs are not displayed.

Article Change History:
12 Oct 1994 - Added keyword and made minor technical updates.
24 Jun 1994 - Added information regarding applications not making required calls to certain Print Manager routines.
31 May 1994 - Added PageMaker to list of applications and added information on next revision of the software.
15 Apr 1994 - Changed title to include LW Pro 810.

LaserWriter Select 310: Printing Problems from Workstation(3/94)

Revised: 3/7/94
Security: Everyone

LaserWriter Select 310: Printing Problems from Workstation(3/94)

==========

Article Created: 7 March 1994

TOPIC ----------

A customer has a LaserWriter Select 310 with 5MB RAM connected to a Sun workstation using the serial port.

Very small PostScript files print fine, but when a nominal size PostScript file is sent to the printer, it blinks then resets itself without printing anything. What is causing this to happen?

DISCUSSION ----------

There are a couple of things that the customer can try, as well as verify:

1) Make certain that the printer has not been previously communicating to a Macintosh within the current power cycle. If so, the LaserWriter Select 310 driver puts the printer into a special serial communications mode. To solve this, turn off the power to the printer, then turn it back on.

2) Set the communications on the Sun for:

   57.6 Kbaud (try 38.4 Kbaud if 57.6 fails), two stop bits, no parity, 8 data bits

3) Verify that the PostScript code, or the driver generating it, is producing good code. You might try sending the code to another printer.

LaserWriter Fax: Group Fax Has PostScript Selected (3/95)

Revised: 3/23/95
Security: Everyone

LaserWriter Fax: Group Fax Has PostScript Selected (3/95)

==========

Article Created: 2 March 1994
Article Reviewed/Updated: 23 March 1995

TOPIC ----------

When we use the LaserWriter Fax software (8.xf) with a fax-capable printer to send a "group fax" (sending to more than one number) it sets off the PostScript fax "flag" (the PostScript Fax check box gets turned on), and has to redial the destinations. Also, when sending to a group with return reciepts, you only get confirmation of the first user of the group.

Do these situations cause any problems when sending a fax to a non-PostScript fax machine? When will this be resolved?

DISCUSSION ----------

There are PostScript flag and confirmation page problems when sending group faxes. Both issues have been reproduced in our lab, and have been reported to engineering.

Workaround

Fortunately, there is a simple workaround to both issues. After selecting the group to fax to, click on Options in the Fax Destination dialog box, and then uncheck the PostScript checkbox. This prevents the PostScript fax card from dialing out twice; instead it just sends a Group 3 fax the first time. In addition to this, confirmation pages print for each and every job.

NOTE:
The problem occurs only when every phone number in the fax group is just a standard Group 3 fax machine.

If the phone numbers in the group include mixed Group 3 and PostScript fax destinations, then a user is NOT allowed to send a group fax using "Broadcast using Printer", but must instead select "Broadcast using Computer". With "Broadcast using Computer" selected, confirmation pages print for each job,

however, two phone calls are still placed for standard Group 3 faxes. Finally, if all the phone numbers in the group are PostScript there are no problems; only one phone call is made and confirmation pages print for each job.

Helpful Suggestions

The following suggestions might make the problems less troublesome:

• In the Fax Phone Book, label the fax numbers with "PS" after their names so that it is easier to distinguish the type of fax machines.

• Use the LaserWriter Fax Utility to "Display the Activity Report". This option in the utility queries the LaserWriter for its recent fax activity and displays it for you.

Clearly, the best way to resolve the issue is to uncheck the PostScript box when sending a group fax to Group 3 fax machines. Regardless of whether you turn off the PostScript option or not, the fax is sent successfully.

Article Change History:
23 Mar 1995 - Updated and expanded with additional information.
10 Jun 1994 - Revised instructions on turning off PostScript
18 Mar 1994 - Added how to decrease the time it takes to send the fax.

Power Macintosh: Which Models Support Memory Interleaving?(6/96)

==========

Article Created: 3 March 1994
Article Reviewed/Updated: 26 June 1996

TOPIC ----------

Do any of the Power Macintosh computers or Workgroup Servers use memory interleaving? I heard that the PowerPC 601 chip will not support interleaving.

DISCUSSION ----------

Memory interleaving is a function of the memory controller not the microprocessor. Therefore, some Power Macintosh models based on the same microprocessor will support memory interleaving while others based on the same microprocessor will not.

For example, the Power Macintosh 7500, which is based on the PowerPC 601 microprocessor, supports memory interleaving. The Power Macintosh 7200, which is also based on the PowerPC 601 processor, does not support memory interleaving. The difference is that the Power Macintosh 7500 uses the HammerHead ASIC memory controller which supports memory interleaving and the 7200 uses the Platinum IC which does not support memory interleaving. The Power Macintosh 6100, 7100, and 8100 computers use the High-speed Memory Controller (HMC) which also does not support memory interleaving.

Begin_Table

POWER MACINTOSH SERIES NUMBER	MICROPROCESSOR	MEMORY CONTROLLER	MEMORY INTERLEAVING
Power Macintosh 6100	601	HMC	NO
Power Macintosh 6150	601	HMC	NO
Power Macintosh 7100	601	HMC	NO
Power Macintosh 7200	601	Platinum IC	NO
Power Macintosh 7250	601	Platinum IC	NO
Power Macintosh 7500	601*	HammerHead ASIC	YES
Power Macintosh 7600	604*	HammerHead ASIC	YES

Power Macintosh 8100	601	HMC	NO
Power Macintosh 8150	601	HMC	NO
Power Macintosh 8500	604*	HammerHead ASIC	YES
Power Macintosh 8550	604*	HammerHead ASIC	YES
Power Macintosh 9150	601	HMC	NO
Power Macintosh 9500	604*	HammerHead ASIC	YES

* Removeable/upgradeable microprocessor card

Newton: Mac Connection Kit 2.0 Format Files (3/94)

Revised: 8/5/94
Security: Everyone

Newton: Mac Connection Kit 2.0 Format Files (3/94)

==========

Article Created: 03 March 1994

TOPIC -----

When should we use Newton Connection import/export format in Newton Connection for Macintosh version 2.0?

DISCUSSION -----

The Newton Connection format can be used to:

- Move information between two Newton Connection synchronize files
- Distribute information to other people who have Newton Connection
- Move data to another application that supports Newton Connection format

This file format contains all Newton information and you are guaranteed not to lose data with this format. In the future, other applications may also support the format removing the need for translators and templates.

Newton: Mac Connection Kit 2.0 Template Caveats (12/94)

==========

Article Created: 3 March 1994
Article Reviewed/Updated: 14 December 1994

TOPIC ----------

What are some of the issues when using the template import/export format feature of Newton Connection for Macintosh 2.0?

DISCUSSION ----------

Look for the following issues when using templates:

1) There are situations in which a file exported using a template and then re-imported into a Newton Connection Kit file may lose information. The templates import and export files with text only. This means that any graphics in your Newton data will not be exported if you use a template. If your data contains tabs, returns or multiple paragraphs (**), some of the data may be lost if you export with a template that uses Tab and Return as the field and record separators. To avoid this, click Options in the Edit Template dialog window and choose a character that does not appear in your data as the separator, or export in Newton Connection format. If you want to move all information from one Newton Connection Kit file to another, it is strongly recommended that you use the Newton Connection format to import and export the information. This format contains all information necessary to move the data between two or more Newton Connection files. It is also cross platform and will be supported by Newton Connection for Windows 2.0.

(**) Multiple paragraphs are concatenated with Carriage Returns.

2) Repeating meeting information may be lost when exporting repeating meetings using templates. The meeting still repeats but all special case information is lost. For example, if a repeating meeting repeats every Thursday for a month, and on the Newton you change week three's meeting from Thursday to Friday, the special case of having a Friday meeting for the third week will be lost.

Newton: Connection Kit 2.0 Import and Export Caveats (12/94)

==========

Article Created: 3 March 1994
Article Reviewed/Updated: 14 December 1994

TOPIC ----------

What are some of the caveats when using the built in DataViz translators that are included with the Newton Connection for Macintosh version 2.0?

DISCUSSION ----------

Here are some tips to keep in mind when using the translators:

• If you are exporting from a Newton application that contains fields not present in the designated supported Macintosh application, information in the fields not supported by the Macintosh application will not be exported. For example, in Newton Connection, name file entries have a field for the e-mail address. Dynodex 3.0 does not have a field for the e-mail address. Therefore, if you export a name entry to a Dynodex file, the e-mail address will not be exported.

Also, if you are importing information from a Macintosh application that contains fields not present in the corresponding Newton application, data from the unsupported fields will not be imported.

• Newton graphics and ink can be exported as PICT graphics from Newton Connection using the built in DataViz translators. However, PICT graphics in Macintosh applications can not be imported as Newton graphics and ink. Only the Newton Connection Format supports import of graphics into Newton Connection. However, future third party Macintosh applications might support this format.

• Some translators will break repeating meetings and repeating day notes into individual meetings and day notes. For example, if you export one yearly repeating meeting from Newton Connection into ACT! 1.1, the Newton repeating meeting will be translated into 10 non-repeating meetings which occur once a year for 10 years.

3.5 Disks: Unformatted and Formatted Capacity (2/95)

Revised: 2/8/95
Security: Everyone

3.5" Disks: Unformatted and Formatted Capacity (2/95)

==========

Article Created: 2 March 1994
Article Reviewed/Updated: 8 February 1995

TOPIC ----------

Some 3.5' floppy disks are marked as 1MB and 2MB. Why are the disks marked as such when the formatted capacity is 800K and 1.44MB respectively?

DISCUSSION ----------

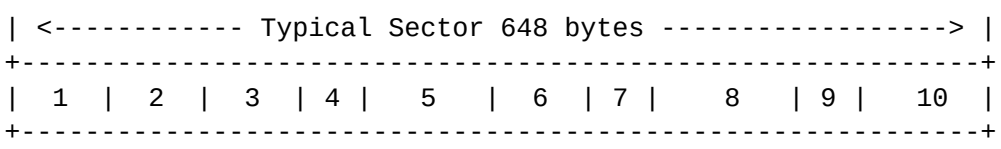
The 1MB and 2MB ratings are unformatted capacities. Regardless of what computer you initialize these disks with, you do not get a data capacity of the full 1MB or 2MB. This is due to the way information is stored on floppy disks. Depending on what operating system is used, more information than 800K or 1.44MB can be placed on a floppy disk. This is because they use additional sectors per disk.

Macintosh Disk Capacities
==========

	Double Density	High Density
	1 MB Unformatted	2 MB Unformatted
	800K Formatted	1.44MB Formatted
	---	---
Bytes/Sector	512	512
Sectors/Tracks	8-12 (variable)	18
Track Density tpi	135	135
Tracks/Side	80	80
Sectors/Disk	1600	2880
Bytes/Side	409,600	737,280
Bytes/Disk	819,200	1,474,560

Typical Disk Sector
==========

A typical disk sector consists of 648 bytes of information. Here is how this information is encoded on the disk:



1	Sector Gap	12 bytes
2	ID Mark	4 bytes
3	Track and Sector Address	4 bytes
4	CRC	2 bytes
5	ID Gap	22 bytes
6	Date Block Gap	12 bytes
7	Data Mark	4 bytes
8	Data Field	512 bytes
9	CRC	2 bytes
10	Data Block Gap	84 bytes

How Disk Space is Calculated

When formatted disk space is calculated, most of the sector information is not included. The only information used is the data field. Here is the formula used to determine the amount of information on a floppy disk.

Sides x Tracks x Sectors x Bytes/Sector = amount of information a disk can store

For a High Density disk this would be:

2 x 80 x 18 x 512 = 1,474,560 bytes

The Macintosh double density disk gets a bit more difficult because it uses 5 different speeds. When the speed changes, so does the sectors in per track. Here is a table with the track information and our formula:

Tracks	Sectors
00 - 15	12
16 - 31	11
32 - 47	10
48 - 63	09
64 - 79	08

Formula

Sides x Tracks x Sectors x Bytes/Sector = Information

Double Density Disk

2 x 16 x 12 x 512 = 196,608

```
2 x 16 x 11 x 512 = 180,224
2 x 16 x 10 x 512 = 163,840
2 x 16 x 09 x 512 = 147,456
2 x 16 x 08 x 512 = 131,072
.                   -------
.Total disk space = 819,200 bytes
```

Power Macintosh: High-Speed Memory Controller (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: High-Speed Memory Controller (3/94)

==========

Article Created: 3 March 1994

TOPIC ----------

This article describes the high-speed memory controller on all Power Macintosh computers.

DISCUSSION ----------

The high-speed memory controller (HMC) is an ASIC chip that controls all memory operations in Power Macintosh computers. The HMC has the following features that support data transfers to and from the PowerPC 601 microprocessor:

- Support for all basic transfer protocols, including all single-cycle accesses
- Support for four-cycle 32-byte cache accesses
- Translation of misaligned read actions into double-word read actions
- Implementation of address-only transactions
- Bus arbitration (of the address bus only)

The HMC does not support the following features:

- Pipelining of memory bus transactions
- Cache snooping
- Recovery from transfer error acknowledge signals
- Little-endian transfer mode

Macintosh DOS Compatibility Card: Specifications (3/94)

Revised: 9/29/95
Security: Everyone

Macintosh DOS Compatibility Card: Specifications (3/94)

==========

Article Created: 3 March 1994
Article Reviewed/Updated: 28 September 1995

TOPIC ----------

This article gives the technical specifications for the Macintosh DOS Compatibility Card.

DISCUSSION ----------

The Macintosh DOS Compatibility Card is designed for the Macintosh Centris 610 and Macintosh Quadra 610 computer.

Description

• 7-inch DOS Compatibility Card compatible with 68040 processor-direct slot of Macintosh Centris 610 and Quadra 610

Power

• +5 volts

• 10 watts maximum

Expansion RAM

• One 72-pin DRAM SIMM; expandable to 32 MB

DMA

• One 32-bit DMA Channel

• DMA for shared, memory support provided through Macintosh system software

Video Modes

- VGA modes 0-7 and d13h

- SVGA modes for 640 x 480 and 800 x 600 (16-in only)

- EGA, CGA, MDA also supported

Sound

- PC sound played though Macintosh speaker or headphones

Serial Ports

- Macintosh Serial ports can emulate two 16450-compatible serial interfaces

Parallel Port

- Macintosh printer port can emulate PC-compatible parallel port

Keyboard

- Macintosh ADB keyboard and mouse emulate PC AT-compatible keyboard and PS/2-compatible mouse

Environmental Requirements

- Operating temperature
  50 to 104 degrees F (10 to 40 C)

- Humidity
  10% to 90% noncondensing

- Altitude
  10,000 feet maximum (3048 m)

System Requirements

- Macintosh Centris 610 or Quadra 610

Ordering Information

- M2153LL/A

LaserWriter Select 360 Parallel Port: Data Flow (3/94)

Revised: 3/7/94
Security: Everyone

LaserWriter Select 360 Parallel Port: Data Flow (3/94)

==========

Article Created: 7 March 1994

TOPIC

We have a LaserWriter Select 360 connected to our Ethernet network via a NetQue from Emulex (software version 4.1). When a job is sent to the printer using LaserWriter driver version 8.1.1, the green LED flashes, but no document is printed. The same configuration with the version 7.1.2 of the driver works fine. If we print serially with the 8.1.1 driver however, the configuration works.

Can you explain the difference between driver LaserWriter 7.1.2 and 8.x, and why it's not possible to print via the parallel port using the NetQue device with LaserWriter 8.x?

DISCUSSION

The LaserWriter Select 360 parallel port is unidirectional, however the LaserWriter driver 8.x expects to receive information back from the printer. The driver relies on bidirectional communications because it sends out various queries to obtain information about the characteristics of the target output device (such as features, fonts, etc.) before beginning a print job. The 7.x LaserWriter driver does not rely on bidirectional communications.

Included below is an excerpt from the APDA developer notes on the LaserWriter Select 360 regarding the parallel port:

"The Centronics parallel interface is essentially an input-only channel. This means it transfers information from the host to the printer. However, the PostScript interpreter always deals with both the input and output sides of an I/O channel. When operating in Centronics parallel input mode, the printer sets up the 8-pin serial port for the PostScript language print operator. The output from this port may be ignored for simple one-way communication. However, important information may be output via this port.

Printer errors are always reported, since the Paper Error signal on the Centronics interface cannot be relied upon to report all printer errors."

Macintosh Color Display, Quadra 605 and Energy Saver software

==========

Article Created: 4 March 1994
Article Reviewed/Updated: 12 May 1994

TOPIC ----------

The Macintosh Color Display is listed as being Energy Star compliant but the Energy Saver software is telling me that the monitor is not compatible when installed on a Quadra 605. Is the software being revised to support this monitor? Should this configuration work with the Energy Saver software?

DISCUSSION ----------

The Quadra 605, Macintosh Color Display, and the Energy Saver Display software (version 1.0), are compatible.

For this configuration to function properly you must be using system software version 7.1 and have at least 2MB of system memory available. Also, ensure that you are not using the CPU Energy Saver software (version 1.0.1) which is not designed to control the display. You must also use the Custom Install button even though there is only one item to select in the Custom Install list.

Serial Switch CDEV: Use with AV Computers (3/94)

==========

Article Created: 4 March 1994

TOPIC -----

A customer is currently using the Serial Switch v1.1a1 CDEV on his Macintosh Quadra 900. His also is using a Macintosh Quadra 840AV. He would like to use the serial switch for his AV system but gets the message "Cannot be used with this Macintosh.”

Are there any plans for making a Serial Switch CDEV for the AV systems?

DISCUSSION -----

The Serial Switch is designed for products that contain intelligent I/O processors (IOPs). Only the Macintosh IIfx, Quadra 900, and 950 have IOPs on the ports for the floppy disk, ADB, and serial I/O. Since the Quadra 840AV doesn't have IOPs, this program will return the error message you report.

Article Reviewed/Updated: 30 Aug 1995

TOPIC ----------

The minimum file size on my 2 GB drive is 32K, and I would like to make it smaller, but I can't seem to do it with HDSC setup. Why is the file size so large, and what can I do to make it smaller?

DISCUSSION ----------

In both the Macintosh and DOS environments, the maximum number of blocks on a drive is 65,536 because both Operating Systems address the allocation blocks with a 16-bit address. Drives larger than 512 MB cannot use a block size of 8K or less because there just aren't enough addresses. Thus, if a 2 GB drive is one Macintosh partition, the smallest file size allowed will be 32k. (If you saved a TeachText file with one character, it would take up 32k of disk space.) This can waste a lot of space on large drives that have a lot of small files.

One solution to this problem would be to partition larger drives into smaller partitions or logical drives, each with a maximum of 65,536 blocks. Apple's Drive Setup can be used to partition qualified Apple hard drives and some removable devices as listed in the Drive Setup Guide file. Unsupported hard drives will show up in the device list by name, however, if you select an unsupported hard drive you will get the message, "Cannot modify a disk in an unsupported drive."

Also, Drive Setup is supported on all of the Power Macintosh computers. This includes the original Power Macintosh computers and the new PCI-based Power Macintosh computers. Drive Setup is also supported on 68LC040 processor-based systems that have IDE drives installed. Drive Setup is not supported with the Power Macintosh Upgrade Card.

There are third-party companies that offer solutions for creating multiple Macintosh partitions. A few that we know of are:

Direct Dialup Mail Overview and Issues (5/96)

Revised: 5/30/96
Security: Everyone

Direct Dialup Mail Overview and Issues (5/96)

==========

Article Created: 4 March 1994
Article Reviewed/Updated: 30 May 1996

TOPIC ----------

This article provides a basic description of the capabilities of Apple's Direct Dialup Mail (DDM) software.

DISCUSSION ----------

Please refer to the "PowerTalk User's Guide" (from System 7 Pro), Appendix B for details on setting up and configuring the software. See Using Direct Dialup Mail in this article for an example.

You can find Direct Dialup Mail 1.2 on Apple Computer's software update locations.

These articles can help you locate Direct Dialup Mail 1.2:

• "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

DDM Functionality

What DDM Does

• Lets you send Apple mail to another DDM/PowerTalk user (peer-to-peer).

• Lets another DDM user send you Apple mail provided you have the software configured to accept incoming calls.

What DDM does NOT do

- Let you retrieve your remote mail from another PowerTalk equipped Macintosh.

- Let you get PowerShare mail from a PowerShare server

DDM Requirements and Issues

DDM requires a Macintosh running PowerTalk. It also requires that modems be attached to the Macintosh computers to which you want to connect. See the "PowerTalk User's Guide" (or Using Direct Dialup Mail later in this article) for instructions on installing DDM and adding it to your PowerTalk Key Chain. Be sure to obtain the proper CCL script for the modem you are using. CCL scripts are obtained from the specific modem vendor. DDM uses the same modem scripts and setup control panel as Apple Remote Access. Because DDM is more particular about modem scripts, it is very important to use the most updated scripts from the modem vendors.

Once you have installed DDM, the modem connected to the Macintosh is always in "answer call" mode. While in this mode the modem cannot be used with any other communications software except Apple Remote Access (ARA), if it is installed. DDM must be disabled using the "I'm at..." command to use the modem for anything other than ARA or DDM.

There is no Status Window indicating that DDM is dialing, so the only indication you have of what is going on are the modem tones.
When addressing an Apple mail message using the DDM option, DDM attempts to send the mail message immediately. If it cannot connect to another DDM user's modem, then it retries three times before giving up. You can also specify a preset time to send all your DDM mail. This mode keeps all the mail in your Out Tray until the specified time, and then attempts to send each message.

Information for AppleTalk Remote Access Users

AppleTalk Remote Access (ARA) 1.0 is not compatible with Direct Dialup mail. It is automatically removed from your hard disk when you install Direct Dialup mail. If you want to run PowerTalk Direct Dialup Mail concurrently with AppleTalk Remote Access Software, you must upgrade to ARA version 2.0 or later. ARA MultiPort Server is not compatible with Direct Dialup mail. Do not install both ARA Multiport Server and Direct Dialup mail on the same computer.

Upgrade Products

- M1964Z/C Apple Remote Access Client for Macintosh Upgrade Kit v2.0.1

- M2678Z/B Apple Remote Access Personal Server for Macintosh Upgrade Kit v2.0.1

These products require proof of purchase of version 1.0 or 2.0 and are available

at authorized Apple resellers and dealers. For the name of a nearby authorized Apple reseller or dealer in the U.S., call (800) 538-9696. For more information on the Apple Remote Access product family, contact the Apple Network Information Line at (408) 862-3385. To obtain information on availability of Apple Remote Access Software outside the U.S., please contact your local Apple representative.

Using Direct Dialup Mail

You use the Direct Dialup Mail Accessory Kit for sending and receiving mail over a modem to another computer.

Setting Up the Software

After you have installed Direct Dialup mail, you are ready to set it up. Follow these steps:

Step 1:
Open your PowerTalk Key Chain. If you have not already given your Key Chain Access Code, you are asked to enter it. The Key Chain dialog box appears, listing your current services.

Step 2:
Click the Add button to bring up a list of available services.

Step 3:
Select Direct Dialup Mail and click OK. The dialog box closes and Direct Dialup is added to your list of available services.

Step 4:
Double-click Direct Dialup. The Direct Dialup dialog box appears.

Step 5:
Fill in or change information as appropriate.

Step 6:
To set the software to control your modem, click Modem Setup.

Step 7:
In the dialog box that appears, use the pop-up menus to choose the kind of modem you have and make sure the port setting is correct. Click the appropriate radio button to turn the modem speaker on or off.

NOTE:
If the pop-up menu does not list your modem, try the Hayes setting with the same speed as yours. If that does not work, contact the manufacturer to get the necessary software.

Step 8:
Close the Remote Access Setup, Direct Dialup, and PowerTalk Key Chain windows. Your software is now installed and ready to run.

Adding Dialup Addresses

You can add a dialup telephone address to an information card for easy access. Follow these steps to add a Direct Dialup mail address:

Step 1:
Find the information card to which you want to add a Direct Dialup mail address.

Step 2:
Open the card and use the pop-up menu to move to the Electronic Addresses page.

Step 3:
When the Electronic Addresses page appears, click Add at the bottom of the card. A dialog box appears, asking for the kind of address to add.

Step 4:
Select "Direct Dialup mail" and click Add. An untitled Dialup Address line appears on the card, ready for you to fill out.

NOTE:
Make this address the preferred one by highlighting its radio button. The Mailer uses the preferred address when it sends documents.

Step 5:
Type a descriptive name for this address. Something like "Mary's Home Modem" is a good choice because it describes both the owner and the modem's location.

Step 6:
Double-click the icon to the left of the address line to add the necessary dialup information. Select the top radio button to have the system use the information you supplied in the Direct Dialup dialog box (described earlier in this article) to form this person's telephone number. Then enter the required numbers in each of the three fields. If your area code and the area code you enter on this person's card are the same, the system does not use the area code when it dials.) For example, the Country code field can hold the standard 1 prefix used before North American area codes.

Select the bottom radio button to have the system use the number you type into the lowest field without regard for the information you supplied in the Direct Dialup dialog box. You can change any of these settings at any time.

Step 7:
Click the Close box when you are finished to confirm your settings and put the dialog box away.

Step 8:
Click the information card's close box. Once the dialup address information is complete, you can send mail to that address just as you can to any other address in PowerTalk.

Using Dialup Addresses in the Mailer

==========

Adding addresses

To add a dialup address from your personal catalog, follow these steps:

Step 1:
Click the top button in the Catalogs access panel.

Step 2:
Locate and select the information card containing the dialup address.

NOTE:
To use an information card as the source of a dialup address, a Direct Dialup number must be selected as the preferred address on the Electronic Addresses section of the information card.

Step 3:
Click the To button.

Manually Entering Address

To enter a dialup address for a letter's recipient, follow these steps:

Step 1:
Open the Mailer's Catalogs access panel and click the bottom button.

Step 2:
Type the exact phone number for the dialup recipient's modem. You can use a hyphen to separate the parts of the number if you want.
You can also use the form <name>@<number>.

Step 3:
Choose Dialup from the catalog pop-up menu.

Step 4:
Click To (or press the Return or Enter keys) to address the letter. To put a copy of this dialup address in your preferred personal catalog, press the Option key and click the Save button.

Step 5:
Provide any other necessary information in the Mailer and send the document.

Troubleshooting
==========

You may experience an occasional problem using the dialup service. Here are a few common problems and some suggested solutions.

Error Message When Typing a Phone Number

When you type a phone number in an address window, the system adds a message at the bottom stating that your dialup service has not been set up.

Open the PowerTalk Setup control panel and check that the dialup service information is complete and that you have entered your local phone number.

The Dialup Service Does Not Work

You have set up your dialup service, but it does not seem to work. For instance, the modem will not dial an address, try these solutions:

- Be sure the modem is turned on and your phone line is connected.
- Verify that you have selected your model of modem in the Remote Access Setup control panel. If your modem's auto-answer light is on, your setup is probably OK.

Cannot Connect With Another Macintosh

When your modem dials the telephone but cannot connect with another Macintosh, try these solutions:

- Make sure the telephone number is correct.
- Make sure the Macintosh you are trying to connect with is turned on, the modem is connected, and the computer and modem are set up correctly.
- If you are using a charge card number in the Direct Dialup control panel, you may need to make Direct Dialup wait longer before dialing the charge card number. The default delay in the U.S. is 20 seconds. To increase the delay, add one or more commas at the beginning of the charge card number. Each comma increases the delay by two seconds.
- If you are using a charge card in the Direct Dialup setup window, make sure you select tone dialing in the Remote Access Setup window.
- If you see a triangle icon on the right side of your Out Tray or In Tray, it means there is a problem. Click the triangle icon for more information.

Connects Then Drops Connection

If your modem connects with another modem but then loses the connection, try these solutions:

- Make sure you selected the correct modem type when setting up the software.
- If your telephone line has a call-waiting feature turned on, try turning that feature off. Call waiting can interrupt modem connections.
- Your telephone line may have excessive noise. Contact your telephone company.
- If you are using another application program that uses the modem, quit that program before using Direct Dialup.

A Reply To a Letter Does Not Get Through

You reply to a letter that originally had multiple recipients, at least one of which had a dialup address, but your reply to that dialup address does not get through.

Check the area code of the dialup address. If the original sender of the letter

and the dialup recipient were in the same area code (for example, 408), but you are in a different area code (for example, 212), the dialup recipient's address would not have any area code listed. (There would have been no need for the original sender to include an area code.)

Unless you change the dialup address, the system would dial without an area code and try to send your reply to your area code (212) instead of the proper one (408).

Other Troubleshooting Tips

• To cancel a call in progress, open the Out Tray and drag the sending item to the trash.

• To suspend Direct Dialup from using the port and phone temporarily, choose "I'm at" from the Special menu, and uncheck the Direct Dialup checkbox.

• To use the MNP 10 protocol, both your modem and the one you call must support the protocol.

• If you are using a Macintosh IIfx, a Macintosh Quadra 900, or a Macintosh Quadra 950 and have virtual memory turned on, you must open the Serial Switch control panel and change the serial port setting to Compatible.

• If the error code -9014 appears while sending a Direct Dialup mail, choose "I'm at" from the Special menu, and make sure the Direct Dialup checkbox is checked.

• If you drag a type-in Direct Dialup address from the mailer's recipient field to the desktop and change its name on the desktop, the address will become invalid and may not be used thereafter.

• You may experience an occasional problem using the dialup service. Here are a few common problems and some suggested solutions.

• When you type a phone number in an address window, the system adds a message at the bottom stating that your dialup service has not been set up.

• Open the PowerTalk Setup control panel and check that the dialup service information is complete and that you have entered your local phone number.

Apple Remote Access: Changes From 1.0, 2.0, & 2.0.1 (2/96)

Revised: 2/9/96
Security: Everyone

Apple Remote Access: Changes From 1.0, 2.0, & 2.0.1 (2/96)

==========

Article Created: 4 March 1994
Article Reviewed/Updated: 9 February 1996

TOPIC -----

This article lists the differences between ARA 1.0, 2.0, and 2.0.1.

DISCUSSION -----

Differences Between ARA 1.0 and 2.0
==========

ARA 1.0

ARA 1.0 had both client and server capability, and came with a license to copy to three computers. ARA 1.0 cannot connect to an ARA 2.0 server.

ARA 2.0 Personal Server

ARA 2.0 Personal Server comes with a license to copy to two computers, and can act as a server or a client. There is a compatibility mode allowing connection to ARA 1.0 servers.

ARA 2.0 Client

ARA 2.0 Client can only access ARA 1.0 or 2.0 servers, it does not provide server capability.

ARAP 2.0

The AppleTalk Remote Access Protocol (ARAP) provides efficient AppleTalk services on a per client basis over slow links. It defines the login and authentication sequences. The ARAP specification has been enhanced to include the ability to change passwords, allow password retries, authenticate a user using external third party security devices, and send out-of-band messages such as alerts and greetings.

In addition, ARAP Version 2.0 now lets administrators of the MultiPort Remote Access Server set the specific zones each user can see. The Apple Remote Access MultiPort Server provides a flexible, scalable, and secure way to offer network access to large numbers of remote or mobile users. Used in conjunction with one or more Apple Remote Access Serial Cards, it lets a Macintosh computer or a Workgroup Server support from 4 to 16 simultaneous dial-up connections.

NOTE: The protocol enhancements are what allow for the new functionality; therefore, ARAP 1.0 based products are not able to take advantage of these enhancements.

Remote Password Change

ARAP 2.0 provides a method for you to remotely change your password (without having to use AppleShare on the same Macintosh as was necessary with ARA 1.0). Other new features in the MultiPort Server product let the administrator set the number of retries allowed before user logon is disabled and to force users to change their passwords via the "New password required" field in the user setup window.

SNMP Management

Integrated network management via SNMP is now a part of the MultiPort servers.

Roving Access Security

Dial-back is not satisfactory for you if you want both security and mobility. Mobile security is now added to the feature list by allowing for the use of third party "security cards". With some "security cards" you must type in a personal code and a requester code into a credit card size calculator like device. The device then returns the SecureID. Other "security cards" are time based and constantly display current SecureID information. When trying to make a connection to a secure server, you see a dialog box requesting a SecureID. Without the SecureID and the standard username and password you are not able to get access to the server.

X.25 connectivity

The new MultiPort Server software supports extensions that let you connect to ARA through an X.25 network. This type of access is valuable in situations where the cost of X.25 asynchronous dial-up service is less than the cost of end-to-end service through the phone companies. These X.25 extensions are sold as separate products from ARA 2.0 MultiPort server.

DialAssist

DialAssist is a client software (both ARA Personal Server 2.0 and ARA 2.0 Client Only) feature that makes long distance, credit card, international, and private PBX calling extremely easy for you. The software is preconfigured with all of the most common dialing codes so that a you only have to select items from pop-up menus.

MNP10 error correction

If you have a modem that supports MNP10 error correction, it can be turned on via the Remote Access Setup window.

ARA 1.0 and 2.0 Compatibility

Modem Scripts

You can use AppleTalk Remote Access version 1.0 modem scripts with Apple Remote Access 2.0 Personal Server, but you cannot use certain new features, such as Ignore Dial Tone, Manual Dialing, and MNP 10. You cannot use Apple Remote Access Personal Server 2.0 modem scripts with AppleTalk Remote Access version 1.0.

Calling an AppleTalk Remote Access Version 1.0 Server

The AppleTalk Remote Access 1.0 Compatibility option lets you call a version 1.0 server from the ARA 2.0 client and to receive callbacks from a 1.0 server (see Chapter 3 of the "Apple Remote Access Personal Server for Macintosh User's Guide" for details on setting this option). However, it does not let Apple Remote Access Personal Server receive calls from an AppleTalk Remote Access 1.0 client. The Apple Remote Access 2.0 Personal Server can only receive calls from version 2.0 Apple Remote Access Clients.

Supported Scripts

Apple includes some modem scripts with all versions of the ARA server. These are not the only compatible modem scripts. These scripts were current when 2.0 was introduced, but there could be updates from the modem vendors. If you need a new script, contact your modem vendor. The following paragraph is in the Apple Remote Access MultiPort Server Read Me file:

"9600-bps or higher-speed modem scripts included with the Apple Remote Access Client for Macintosh software can also be used with the Apple Remote Access MultiPort Server."

Basically, 9600-bps or higher-speed modem scripts should be compatible with the Apple Remote Access MultiPort Server product. If an ARA 2.0 script is not available for a particular modem, the ARA 1.0 script should work.

If you cannot find the CCL script for you modem, contact the modem vendor directly, check with user groups, or develop your own CCLs with tools from APDA, Apple’s source for developer tools.

Differences Between ARA 2.0 and 2.0.1

The ARA 2.0.1 release addressed the following problems:

1) Fixed a bug that caused ARA 2.0 to crash when running on a Macintosh Plus.

2) Changed the ARA MP (MultiPort) Server to be compatible with the Power Macintosh computers.

3) Added the ability to determine on the fly whether the client is attempting to connect to an ARA 1.0 or 2.x server.

This release has no specific performance enhancements relative to ARA 2.0.

Article Change History:
09 Feb 1996 - Added Differences between ARA 2.0 and 2.0.1.
08 Feb 1995 - Updated and added information from another article.
13 Oct 1994 - Added keyword; made minor technical updates.

ARA 2.0: DialAssist, Manual Dialing, & Redial (3/94)

Revised: 3/4/94
Security: Everyone

ARA 2.0: DialAssist, Manual Dialing, & Redial (3/94)

==========

Article Created: 4 March 1994

TOPIC ----------

Dialing, Redialing and DialAssist information for ARA

DISCUSSION ----------

Manual Dialing

When you use Manual Dialing, establishing a Remote Access connection varies according to the type of modem you are using. To ensure that you can make a connection while using Manual Dialing, you may need to experiment with pressing the Connect button slightly before or after you hear the remote modem answer the phone.

ReDial Feature

Remote Access Client will attempt redialing only when the phone number that has been dialed is busy. If the connection attempt has failed for any other reason, Remote Access will stop the redialing attempts so that you can correct any problems.

When using the Redial option, you should set the “Time between retries” number to five seconds or greater. Depending on the modem, anything less than five seconds may not give your modem sufficient time to reset, resulting in your Macintosh serial port being busy and unavailable for redialing.

When using the Re dial alternate number option, the main number will be dialed once before the redialing sequence is initiated. The redialing sequence will then alternate between the main and alternate numbers.

DialAssist

In certain countries city/area codes don't exist. If you are calling within such a country and you encounter problems, try entering a space in the "Connect

To City/Area Code" field in your connection document to get DialAssist to work properly.

Adding AppleShare File Servers to the PowerTalk Keychain (3/94)

Revised: 3/4/94
Security: Everyone

Adding AppleShare File Servers to the PowerTalk Keychain (3/94)

==========

Article Created: 4 March 1994

TOPIC -----

I want to add keys for additional AppleShare servers to my PowerTalk Key Chain, and I don't know how to do it. Logging into them via the Chooser doesn't provide an opportunity to add them, so how is this accomplished?

DISCUSSION -----

AppleShare file server entries can be added to the Key Chain in two ways:

1) Access the server via an alias. You will then be provided with the dialog asking if you want to add that server to your Key Chain.

2) Access the server via AppleTalk Catalogs. When you search through the catalog for an AppleShare server, and select one, You will then be provided with the dialog asking if you want to add that server to your Key Chain.

PowerTalk uses the Alias Manager to trigger the additional dialog allowing you to add the server to your keychain. The Chooser does not use AppleEvents, nor the Alias Manager, and therefore has no way to trigger the dialog.

Note: Once added to your Key Chain the logon dialog box for a server will be skipped when accessing via an alias or AppleTalk Catalogs. Access via the Chooser still requires entry of user name and password.

A/UX 3.0.1: cat Displaying Files Incorrectly (3/94)

Revised: 3/4/94
Security: Everyone

A/UX 3.0.1: cat Displaying Files Incorrectly (3/94)

==========

Article Created: 4 March 1994

TOPIC ----------

When I use "cat" in the A/UX CommandShell, it is not displaying the file correctly. The lines are bunched up with one line on top of the other.

DISCUSSION ----------

A/UX 3.0.1 has new variable called "TBTRANSLATEUXONLY" that is set in the shell scripts /mac/bin/mac32 and /mac/bin/mac24. Use the Text Editor to comment this out, and the cat function will return to A/UX 3.0 behavior.

The TBTRANSLATEUXONLY variable affects how carriage returns (CR) and line feeds (LF) are stored in the system. A/UX 3.0 converts carriage returns to line feeds, and then tries to translate the line feeds back to carriage returns when the file is reopened. A/UX 3.0.1 avoids possible complications that this may cause and allows you to set this variable. If this variable is assigned any value in your environment, carriage returns are translated to line feeds upon a file save of UNIX text files. (Files created in the CommandShell as well as by TextEditor are considered UNIX text files.)

Problems Copying Reports Between HyperCard Stacks (3/94)

Revised: 3/4/94
Security: Everyone

Problems Copying Reports Between HyperCard Stacks (3/94)

==========

Article Created: 4 March 1994

TOPIC --------------------

I tried to copy an Avery Mailing Label report from the Address stack that comes with HyperCard 2.2 into my own 2.1 Address stack, and it's not copying correctly. The original label report had three columns and ten rows, and the pasted version has two columns and eight rows. What's wrong?

DISCUSSION --------------------

The problem is with Page Setup in your personal Address stack. In the page setup of your Address stack, choose Options, and make sure that "Precision Bitmap Alignment (4% Reduction) is NOT chosen. Try the copy again, and it should work fine.

Note: In the Reports dialog box in HyperCard version 2.1 there is no Save button, whereas there is a Save in version 2.2. A Save dialog does appear whenever a new report is created or an old report is changed, and the user chooses Print or Cancel (the only two options).

ARA MultiPort Server and Memory (3/94)

Revised: 3/16/94
Security: Everyone

ARA MultiPort Server and Memory (3/94)

==========

Article Created: 4 March 1994

TOPIC --------------------

ARA MultiPort Server version 2.0 has a problem with locking memory that will be fixed in the next release.

DISCUSSION --------------------

The Remote Access Manager application version 2.0 leaves a small locked block in the MultiFinder (Process Manager) heap after the user quits. It is verified that this island in the PM heap could reduce your "Largest Unused Block" size significantly. Engineering has agreed on a fix, which they will begin testing for the next release.

MNP 10 and ARA 2.0: Description (3/94)

Revised: 3/4/94
Security: Everyone

MNP 10 and ARA 2.0: Description (3/94)

==========

Article Created: 4 March 1994

TOPIC ----------

Information regarding the use of MNP 10 error correction.

DISCUSSION ----------

MNP 10 is an error-correction protocol that allows for more reliable data connections using cellular modems.

To establish an MNP 10 connection, your modem and the modem you're calling must support MNP 10, and you must select the “Use MNP 10 error correction in modem” checkbox in the Remote Access Setup window.

If both modems do not support MNP 10 error correction, the selection in the Setup window will do nothing.

Modem Cables Requirements for ARA 2.0 (3/94)

Revised: 3/4/94
Security: Everyone

Modem Cables Requirements for ARA 2.0 (3/94)

==========

Article Created: 4 March 1994

TOPIC ----------

This article describes modem cable requirements for ARA 2.0.

DISCUSSION ----------

Most modems require a cable that supports the data terminal ready (DTR) signal. In addition, certain modems require a cable that supports CTS/RTS hardware flow control.

To support DTR, the cable must connect pin 20 on the DB-25 connector to pin 1 on the Mini DIN-8.

To support CTS/RTS, the cable must connect pin 5 on the DB-25 connector to pin 2 on the Mini DIN-8 and pin 4 on the DB-25 connector to pin 1 on the Mini DIN-8.

See your modem vendor or Apple-authorized dealer about obtaining the necessary cable.

Power Macintosh: AV Video Technologies Card (7/95)

Revised: 2/13/96
Security: Everyone

Power Macintosh: AV Video Technologies Card (7/95)

==========

Article Created: 3 March 1994
Article Reviewed/Updated: 14 July 1995

TOPIC ----------

This article describes the AV Technologies Video Card (Apple order number: M3447LL/A)* found on Power Macintosh.

DISCUSSION ----------

The AV video card is an Apple expansion card that plugs into the PDS (Processor Direct Slot) connector of any Power Macintosh computer. It contains a sophisticated I/O system that handles video input and output signals, mixes video with 16-bit graphics, and supports a wide variety of Apple and third-party monitors. The AV I/O system also lets you connect a television set as a monitor, using either NTSC (National Television Standards Committee - primarily used in North America and Japan) or PAL (Phase Alternating Line - primarily used outside of North America and Japan) format.

The AV card expands the Power Macintosh computer's video capabilities to include the video capture and output features of the Apple AV Technologies. These video features were introduced with the Macintosh Centris 660AV and Macintosh Quadra 840AV.

Power Macintosh models 6100 AV, 7100 AV, and 8100 AV are shipped with the AV card installed. On the Power Macintosh 6100 AV, the card uses an angle adapter card.

A 40-pin connector on the AV card implements the Macintosh Digital Audio/Video (DAV) interface. The DAV connector taps into the AV card's unscaled YUV video input signal; through the PDS interface, it also connects to the digital audio signal input for the sound chip. NuBus cards for the Power Macintosh 7100 AV and 8100 AV can be designed with a flat ribbon cable that plugs into the DAV connector on the AV card, so they can access these video and audio signals directly.

Power Macintosh AV models are shipped with two adapter cables so you can connect your AV card to a standard television set, video camera, videodisc player, and videocassette recorder. The input cable connects the signal pin of an RCA socket to pin 3 (the luminance signal) of the AV card's video output connector.

The video and graphics I/O system is built around two banks of 80ns VRAM with a total capacity of 2MB. The CIVC (Cyclone Integrated Video Interfaces Controller) chip manages this VRAM and provides timing and interrupt signals. Applications can use the VRAM in two ways:

- As a single frame buffer that uses all the VRAM capacity

- As two frame buffers, one for video and one for graphics

If you configure the VRAM as a single video frame buffer, it can all be used for graphics and the video input can be disabled. If you configure the VRAM as two frame buffers, it can store video as well as graphics.

* NOTE:
Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Article Change History:
14 Jul 1995 - Added part number and part number disclaimer.

Power Macintosh: AV Video Card, Video Inputs (12/94)

Revised: 12/14/94
Security: Everyone

Power Macintosh: AV Video Card, Video Inputs (12/94)

==========

Article Created: 3 March 1994
Article Reviewed/Updated: 14 December 1994

TOPIC ----------

This article describes the Power Macintosh computer's AV Video Technologies Card's video inputs.

DISCUSSION ----------

Video input signals, which may be analog composite or S-video in NTSC (National Television Standards Committee – primarily used in North America and Japan), PAL (Phase Alternating Line – primarily used outside of North America and Japan), or SECAM (a French acronym for the television signal format used in France, Eastern Europe, the former Soviet Union, and many former French colonies) format, enter through one of the identical connectors for video input and output. An adapter cable included with Power Macintosh AV models receives composite video from external devices that have RCA connectors and feeds it into the luminance input of the TDA8708 video ADC (Analog/Digital Converter) chip. The ADC chip can also receive separate luminance and chroma signals from S-video sources. The ADC chip digitizes the video waveform and the SAA7194 chip decodes the result into YUV format. The YUV digital video format, also known as YCrCb, is a video signal format with separate luminance and chrominance components.

The SAA7194 chip scales down the video image and converts its format to either 8-bit grayscale, 15-bit RGB, or 16-bit YUV, storing the result in the VRAM buffer.

The data rate for full-screen NTSC video (640 by 480 pixels at 30 frames per second) is 18.43 MB per second through the AV card. The data rate for full-screen PAL video (768 by 576 pixels at 25 frames per second) is 22.12 MB per second. This means that it is practical to record a video image up to one-quarter screen in size on an output device such as an external hard disk drive in real time, without data compression.

Users of the Power Macintosh 6100 AV, 7100 AV, or 8100 AV can capture live color

video with a standard video camera, using the composite video input cable supplied with the computer.

Article Change History:
24 Aug 1994 - Made correction for technical accuracy.
14 Dec 1994 - Added keyword and technical detail; removed MHz references.

Power Macintosh: AV Video Card, Video Output (1/96)

Revised: 1/4/96
Security: Everyone

Power Macintosh: AV Video Card, Video Output (1/96)

==========

Article Created: 3 March 1994
Article Reviewed/Updated: 4 January 1996

TOPIC ----------

This article describes the Power Macintosh computer's AV Video Technologies Card's video output.

DISCUSSION ----------

Video and graphic images stored in VRAM may have different color depths. The two images exit VRAM through its serial access memory port and pass to the Sebastian color palette chip. Sebastian provides independent color lookup tables for video and graphics images and mixes them into a single digital RGB data stream. The Sebastian then converts the result into analog RGB video, using internal DAC circuits.

Analog RGB data passes to the Mickey encoder chip. Mickey either sends RGB directly to the monitor connector or encodes it into NTSC (National Television Standards Committee – primarily used in North America and Japan) or PAL (Phase Alternating Line – primarily used outside of North America and Japan) video signals in composite or S-video format and sends it to other connectors located on the card.

The Power Macintosh uses the HDI-45 for on board video. It supports a dot clock up to 57 MHz. On AV Power Macintosh computers, the AV card supports a dot clock up to 100 MHz.

The AV card has two banks of 80-ns VRAM soldered in, with a total capacity of 2 MB.

The AV card contains two identical connectors for video input and output with adapter cables for composite video devices that have RCA connectors, such as television equipment.

The AV card can support mixed video and graphics in full 24-bit color on small

and medium-sized monitors and in 16-bit or 8-bit color on larger monitors. The color depths (in bits per pixel) available when the AV card drives Apple monitors are listed below:

Monitor type	Screen Size Hor.by Vert.	Color Depths Graphics	Graphics/video
12-inch RGB*	512 by 384	32	32/16
	560 by 384	32	16/16
13-inch RGB or	640 by 400	32	16/16
12-inch monochrome*	640 by 480	32	16/16
	704 by 512	32	16/16
Full-page monochrome*	640 by 870	8	8/8
Full-page RGB	640 by 870	16	8/16*
16-inch RGB*	832 by 624	32	16/16
19-inch RGB	1024 by 768	16	8/8
Two-page monochrome	1152 by 870	8	8/8
Two-page RGB	1152 by 870	16	8/8**
VGA*	640 by 480	32	16/16
Super VGA 56 Hz*	800 by 600	32	16/16
Super VGA 72 Hz*	800 by 600	32	16/16
Super VGA 60 Hz	1024 by 768	16	8/8**
Super VGA 70 Hz	1024 by 768	16	8/8**
NTSC	640 by 480	32	16/16
	512 by 384	32	16/16
Convolved NTSC	640 by 480	8	n.a.
	512 by 384	8	n.a.
PAL	768 by 576	32	16/16
	640 by 480	32	16/16
Convolved PAL	768 by 576	8	n.a.
	640 by 480	8	n.a.

* With a color depth of 16 bits in these configurations, the maximum video window size is limited. If the video window width is 512 pixels or less, the height may be as large as 512 pixels; if the video window width is

more than 512 pixels, the height is limited to 340 pixels.

** The 8 bits of video are grayscale.

The color depths above are shown as the number of bits in which the color or grayscale value of each pixel can be encoded.

Article Change History:
04 Jan 1996 - Made minor technical changes.
16 May 1994 - Added dot clock rates.
14 Dec 1994 - Add keyword, make several minor technical updates.

Apple Media Tool and Windows (3/94)

Revised: 3/7/94
Security: Everyone

Apple Media Tool and Windows (3/94)

==========

Article Created: 7 March 1994

TOPIC ----------

Although the literature states that we support the creation of mixed mode and Windows only CDs with the Apple Media Tool, I have heard and read that there are known problems with being able to read such CDs in the Windows environment. Is there any additional information on this?

Also, for text that is a part of a project created on the Macintosh using the Apple Media Tool and then compiled to run on Windows, are those fonts compiled as part of the project, or does the project rely on the Windows system fonts?

DISCUSSION ----------

While some people have had problems creating mixed mode CD-ROMs, other companies have had good success. It depends on how much time they are willing to spend on development and testing. The most common reasons for problems is that the media files are in the wrong formats or don't conform to the eight character restriction of DOS. A good example of a mixed-mode disc is the "Forever Growing Garden" developed by a company called Arborescence located in San Francisco. The CD is distributed by Media Vision.

Regarding the fonts question:
As with most font handling for all applications, if you don't have the corresponding font on the PC, a default font will be used instead. You can use the PC version of StyleEdit (STYLEDIT.EXE) to look at your text on the PC and find a close match if you don't have the corresponding font. Another alternative would be to create a picture, and font substitution won't be an issue.

CD-ROM Setup 4.0: Don't Need To Move Foreign File Access (3/94)

Revised: 3/8/94
Security: Everyone

CD-ROM Setup 4.0: Don't Need To Move Foreign File Access (3/94)

==========

Article Created: 4 March 1994

TOPIC ----------

Occasionally when CD titles are not recognized by an AppleCD player, users are advised to move the following files from the extensions folder to the root level of the system folder:

- Foreign File Access
- High Sierra File Access
- ISO 9660 File Access
- Audio CD Access
- Apple Photo Access

DISCUSSION ----------

For anyone not familiar with it, Foreign File Access is a system extension which allows AppleCD drives to read non-Macintosh CD formats. The other files let Foreign File Access know how to handle each of those CD formats.

Prior to System 7 these files were stored at the root level of the system folder. That is where Foreign File Access expected to be and to find its supporting access files. Using System 7, some or all of these files may have been located in the extensions folder. At the time, Foreign File Access wasn't aware of the extensions folder and didn't know to look for its files there. Moving these files back to the root level of the system folder caused Foreign File Access to function normally. The operation of Foreign File Access should not have affected the use of Macintosh CD-ROMs in any way.

CD-ROM Setup 4.0 or later has a version of Foreign File Access which is fully compatible with System 7 and will work from within the extensions folder.

Macintosh IIsi Speed Issues When Using Built-In Video (3/94)

Revised: 3/7/94
Security: Everyone

Macintosh IIsi Speed Issues When Using Built-In Video (3/94)

==========

Article Created: 7 March 1994

TOPIC ----------

We have 2 Macintosh IIsi's which are similarly configured and one of them seems to be running faster than the other. Both machines have 5MB of RAM, an 80MB hard drive, are using the built-in video port, and have a clean copy of System 7.0.1 with the tune-up installed. The logic board on the slower machine has been replaced, but it remains slower.

DISCUSSION ----------

When using built-in video with the Macintosh IIsi, performance of the machine can vary depending upon the setup of the system software and what size monitor is connected. The Macintosh IIsi does not have dedicated VRAM, rather it uses the RAM on the logic board for video.

Below are three things that can help improve the speed of a Macintosh IIsi.

1) Increase the Disk Cache in the Memory Control Panel to 768k.

2) Set the Monitors Control Panel to 16 colors/Shades. This reduces the amount of main memory used for the video and therefore allows the computer to run faster

3) As a 12" RGB monitor shows less information than a larger monitor, the computer can be set at 256 colors and still use less memory for the video. If a smaller monitor is suitable, it can improve performance.

Macintosh and LaserWriter SCSI Termination Outlined (5/96)

Revised: 5/30/96
Security: Everyone

Macintosh and LaserWriter SCSI Termination Outlined (5/96)

==========

Article Created: 7 March 1994
Article Revised/Updated: 30 May 1996

TOPIC ----------

Is there a table that outlines the specific termination requirements and capabilities of the Macintosh and Apple printer product lines?

DISCUSSION ----------

Below is a table that includes the SCSI termination specifics for all Macintosh models and LaserWriter printers (current as of this issue) and describes whether termination power (TPWR) is supplied for either the internal or external SCSI bus, depending on which is present (one or both).

Macintosh Models
==========

Here is a description of the information provided in each column of the following table:

Additional Termination

Indicates if additional termination is needed for a separate internal bus.

Internal Device

Indicates if an internal device or BUS TPWR is supplied.

External Bus

Indicates if an external BUS TPWR is supplied.

Term. Type

Indicates the type of terminator required for the external bus.

SCSI Mode

Indicates if the CPU can be used in SCSI disk mode. Currently only some PowerBook models support SCSI Disk Mode.

NOTE: The asterisks in the table correspond to footnotes that follow the table.

CPU Name	Additional Termination	Internal Device	External Bus	Term. Type	SCSI Mode
Macintosh Plus	No	No	No	Gray	No
Macintosh SE	No	Yes	Yes	Gray	No
Macintosh SE/30	No	Yes	Yes	Gray	No
Macintosh Classic	No	Yes	Yes	Gray	No
Macintosh Classic II	No	Yes	Yes	Gray	No
Macintosh Color Classic	No	Yes	Yes	Gray	No
Macintosh II	No	Yes	Yes	Gray	No
Macintosh IIx	No	Yes	Yes	Gray	No
Macintosh IIcx	No	Yes	Yes	Gray	No
Macintosh IIci	No	Yes	Yes	Gray	No
Macintosh IIfx	No	Yes	Yes	Black	No
Macintosh IIvx	Automatic*	Yes	Yes	Gray	No
Macintosh IIvi	Automatic*	Yes	Yes	Gray	No
Macintosh LC	No	Yes	Yes	Gray	No
Macintosh LC II	No	Yes	Yes	Gray	No
Macintosh LC III	No	Yes	Yes	Gray	No
Macintosh LC 520	Intrnl hd	Yes	Yes	Gray	No
Quadra 605	No	Yes	Yes	Gray	No
Quadra 610	On last device	Yes	Yes	Gray	No
Macintosh 630 Family	Intrnl hd	Yes	Yes	Gray	No
Quadra 650	Intrnl hd	Yes	Yes	Gray	No
Quadra 700	Intrnl hd	Yes	Yes	Gray	No
Quadra 800	On last device	Yes	Yes	Gray	No
Quadra 900	On cable	Yes	Yes	Gray	No
Quadra 950	On Cable	Yes	Yes	Gray	No
Performa 200	No	Yes	Yes	Gray	No
Performa 400	No	Yes	Yes	Gray	No
Performa 405	No	Yes	Yes	Gray	No
Performa 410	No	Yes	Yes	Gray	No
Performa 430	No	Yes	Yes	Gray	No
Performa 450	No	Yes	Yes	Gray	No
Performa 460	No	Yes	Yes	Gray	No
Performa 466	No	Yes	Yes	Gray	No
Performa 467	No	Yes	Yes	Gray	No
Performa 475	No	Yes	Yes	Gray	No

Performa 476	No	Yes	Yes	Gray	No
Performa 550	Intrnl hd	Yes	Yes	Gray	No
Performa 600	Automatic*	Yes	Yes	Gray	No
Macintosh Portable	No	No	No	Gray	No
PowerBook 100	No	Yes	No	Gray	Yes
PowerBook 140	No	Yes	No	Gray	No
PowerBook 145	No	Yes	No	Gray	No
PowerBook 145b	No	Yes	No	Gray	No
PowerBook 150	No	No	No	Gray	No
PowerBook 160	No	Yes	No	Gray	Yes
PowerBook 165c	No	Yes	No	Gray	Yes
PowerBook 170	No	Yes	No	Gray	No
PowerBook 180	No	Yes	No	Gray	Yes
PowerBook 180c	No	Yes	No	Gray	Yes
PowerBook Duo 210	No	Yes	No	Gray	Yes**
PowerBook Duo 230	No	Yes	No	Gray	Yes**
PowerBook Duo 250	No	Yes	No	Gray	Yes**
PowerBook Duo 270c	No	Yes	No	Gray	Yes**
PowerBook 520/520c	No	No	No	Gray	Yes
PowerBook 540/540c	No	No	No	Gray	Yes
Duo Dock	No	Yes	Yes	Gray	No
Power Macintosh 6100!	Last device	Yes	Yes	Gray	No
Power Macintosh 7100!	Intrnl hd	Yes	Yes	Gray	No
Power Macintosh 8100!	Last device	Yes	Yes	Gray	No

! Power Macintosh information is valid for all speeds of the particular Power Macintosh model.

Apple Workgroup Server					
AWS 60	Intrnl hd	Yes	Yes	Gray	No
AWS 80	Intrnl hd	Yes	Yes	Gray	No
AWS 95	On cable	Yes	Yes	Gray	No

NOTES:

* An active termination circuit automatically terminates the internal device when it is the last device on the bus. If a terminated device is attached to the external SCSI port, the internal termination is deactivated.

** These PowerBook Duos work in SCSI Disk Mode with a minidock.

Printer Information

Here is a description of the information provided in each column of the following table:

Direct Connect

Indicates if the printer includes a direct SCSI connection.

External Port

Indicates if the printer includes an external SCSI port (for additional font storage).

Term. Type

Indicates the type of terminator required for the external port.

TPWR

Indicates if termination power is supplied and, if so, if it is internal or external.

Reserved SCSI IDs

Indicates if the printer includes a reserved SCSI ID and, if so, what ID number is reserved.

NOTE: The asterisks in the table correspond to footnotes that follow the table.

Printer Name	Direct Connect	External Port	Term. Type	TPWR	Reserved SCSI IDs
LaserWriter	No	No	n/a	n/a	n/a
LaserWriter Plus	No	No	n/a	n/a	n/a
LaserWriter IISC	Yes	Yes	Grey	No	7
LaserWriter IINT	No	No	n/a	n/a	n/a
LaserWriter IINTX	No	Yes	Gray	No	7
LaserWriter IINTXJ	No	Yes	Gray	No	7
LaserWriter IIf	No	Yes	Black	No	6
LaserWriter IIg	No	Yes	Black	No	6
LaserWriter Pro 600	No	No	n/a	n/a	n/a
LaserWriter Pro 630	No	Yes	Black	Int-Yes Ext-No	6&7
LaserWriter Pro 810	No	Yes	Gray	Yes	7
LaserWriter Select 300	No	No	n/a	n/a	n/a
LaserWriter Select 310	No	No	n/a	n/a	n/a
LaserWriter Select 360	No	No	n/a	n/a	n/a
Personal LaserWriter SC	Yes	Yes	Grey	No	7
Personal LaserWriter LS	No	No	n/a	n/a	n/a
Personal LaserWriter NT	No	No	n/a	n/a	n/a
Personal LaserWriter NTR	No	No	n/a	n/a	n/a
Personal LaserWriter 300	No	No	n/a	n/a	n/a
Personal LaserWriter 320	No	No	n/a	n/a	n/a
Apple Color Printer	Yes	No	***	No	****
StyleWriter	No	No	n/a	n/a	n/a
StyleWriter II	No	No	n/a	n/a	n/a
Color StyleWriter Pro	No	No	n/a	n/a	n/a

NOTES:

*** The Macintosh model determines which terminator to use.

**** Indicates the SCSI ID is user-selectable.

Article Change History:

ARA Client: Problems w/Installation from Hard Drive (10/95)

Revised: 10/17/95
Security: Everyone

ARA Client: Problems w/Installation from Hard Drive (10/95)

==========

Article Created: 21 February 1994
Article Reviewed/Updated: 16 October 1995

TOPIC ----------

I cannot install Apple Remote Access. When I double-click the Apple Remote Access Installer that came pre-loaded on my Macintosh PowerBook hard drive, I get a dialog box which asks me to insert the disk "Installer." I don't have a disk called "Installer." How can I install this software?

DISCUSSION ----------

Apple Remote Access (ARA) Client (version 1.0 or 2.0) comes bundled with several Macintosh PowerBook computers. Sometimes you may have problems running the ARA 1.0 Installer from your hard disk as described in the manual.

The following discussion describes a work around that will let you successfully run the ARA 1.0 installer. You will need one 1.4 Megabyte (MB) floppy disk.

NOTE: Before you begin, make sure you double-click on the Installer application, and not the script.

If you have tried double-clicking on the installer application, and still have problems with the installation, follow these instructions:

NOTE: This procedure only works for ARA Client software version 1.0. The ARA Client software version 2.0 or later installer does not show these symptoms and should install properly.

1) Format a 1.4 MB floppy disk and name it "Installer".
2) Locate and open the Apple Remote Access folder on the Hard Disk.
3) You should see four items inside the folder: ARA Installer, Remote Access Read Me, Remote Access Script and a folder called Installer. Copy all items but the Installer folder to the floppy disk.
4) Open the remaining folder "Installer," and copy all 8 items from inside this folder to the floppy disk.

5) Open the floppy disk window and verify that you see 11 items.
6) Open the Chooser and make AppleTalk active.
7) Restart the computer from the Special Menu.
8) Hold the shift key down after the start up chime. Keep holding the Shift key until you see "Welcome to Macintosh. Extensions Off." Release the Shift key.
9) Insert the "Installer" floppy disk.
10) Open the floppy disk window and click twice on the ARA Installer.
11) Restart. ARA is now installed.

Article Change History:
16 Oct 1995 - Clarified ARA 2.0 information.
14 Dec 1994 - Noted that process is for version 1.0 only.
26 Jul 1994 - Changed title, included ARA 2.0, clarified instructions.

Color Clasc, Perf 550/636CD & LC520: Flashing Menu Bar (8/94)

Revised: 8/31/94
Security: Everyone

Color Clasc, Perf 550/636CD & LC520: Flashing Menu Bar (8/94)

==========

Article Created: 18 February 1994
Article Reviewed/Updated: 31 August 1994

TOPIC -----

The Menu Bar constantly flashes on systems with built-in volume buttons such as the Color Classic, the LC 520, the Performa 550, and Performa 636 CD. Zapping the PRAM, booting from a floppy, and/or reinstalling the System Software made no difference.

DISCUSSION -----

The volume button on the front of the machine (labeled with a speaker icon) is stuck in the down position, and when the volume reaches zero, the menu bar flashes. To verify, open up the Sound control panel, and turn the volume to maximum. You will see the volume go all the way back to zero, with a beep at each increment, and the menu bar will start flashing again.

The solution is to press the sound button a few times to see if the button can be freed. If it cannot be changed, then the system will need to be repaired.

Article Change History:
31 Aug 1994 - Added Performa 636 CD to the list.

Removing PMSAM from Key Chain - Lost Mail (12/94)

Revised: 12/8/94
Security: Everyone

Removing PMSAM from Key Chain - Lost Mail (12/94)

==========

Article Created: 21 February 1994
Article Reviewed/Updated: 8 December 1994

TOPIC ----------

Removing a PMSAM (gateway) from your key chain will appear to remove all mail in your PowerTalk mail box associated with that PMSAM (gateway).

DISCUSSION ----------

Starnine ships a QuickMail and Simple Mail Transfer Protocol (SMTP) Personal Message Access Module (PSAM) for Macintosh computers running PowerTalk. The PMSAMs serve as mail gateways retrieving mail from other systems for your PowerTalk mail box, and their preferences are stored in the PowerTalk Setup Preferences file.

There are two ways to recover the missing mail:

1) Look in System Folder: PowerTalk Data: IPM Bin folder path. The IPM Bin folder contains all local queues like in and/or out mail. All of the messages are still there with blank icons and 8-digit file names. You can simply drag the files over the AppleMail application and they will launch and display your messages, attachments included. You can also open the files within AppleMail, and do a Save As to restore the original type and creator so the files are double-click able AppleMail documents again. Although untested, this procedure should apply to messages created by other PowerTalk applications.

2) Change the file type and creator of the files with the 8-digit file names found in System Folder: PowerTalk Data: IPM Bin using a file utility such as FileType, Disk Top or ResEdit. Set as follows:

type: lttr
creator: lap2

Then move the files out of IPM Bin, and open them with AppleMail (or other appropriate mail application).

Article Change History:
08 Dec 1994 - Added information on the PMSAM preferences and IPM Bin folder.

Deleting forgotten root password under A/UX (3/94)

Revised: 3/7/94
Security: Everyone

Deleting forgotten root password under A/UX (3/94)

==========

Article Created: 7 March 1994

TOPIC ----------

I have forgotten my root password under A/UX, how do I create a new one?

DISCUSSION ----------

There are several ways to delete the existing root password:

If Secure Startup is set:

1) Get a clean copy of A/UX startup from their distribution CD, and reinstall.

2) While booted under the Macintosh Operating System, launch ResEdit, and change the resource in the A/UX Startup application SASH ID=1 which is called “state.” Flip the "check passwords" field of this resource ID from 1 to 0 to disable password checking. You need not worry about the existence of the auxstartuprc file in /etc. To re enable switch the field back to 1.

   The existence of the auxstartuprc in /etc does NOT guarantee password checking. Even if the file is not there the bit in A/UX Startup application REALLY controls this behavior.

When Secure Startup is not set:

The actual commands that you will type are enclosed in <> characters for clarity.

1) Start the AWS 95 or launch A/UX Startup.
2) At the "Welcome to A/UX" dialog, click the Cancel button.
3) At the Startup# prompt, type <launch -S> . This will cause A/UX to come up in single user mode.
4) Type <cp /etc/passwd /etc/passwd.old>

5) Once A/UX comes up in single user mode, type <vi /etc/passwd> . This will start the vi text editor and open the passwd file. You will see the passwd file looks something like this:

```
root:CSFE80x0tKY92:0:0::/:/bin/sh
daemon:*:1:1::/:
bin:*:2:2::/bin:
sys:*:3:3::/bin:
adm:*:4:4::/usr/adm:
```

The character string CSFE80x0tKY92 in the first line is the encrypted root password. The encrypted password string will be different on every system. This is the part that must be deleted.

6) Use the arrow keys to move the cursor to the first character of the encrypted password string.
7) With the cursor sitting on top of the first character, in this example the letter C, press the <x> key to delete the characters of the password one at a time.

   BE VERY CAREFUL not to delete the colon (:) at the end of the password string or anything after.
   When you are done, the first line should look like this:

   ```
   root::0:0::/:/bin/sh
   ```

8) To save the changes you made type <:w!> and press return.
9) To exit the vi editor type <ZZ> . That's shift with two z's.
10) To restart the Macintosh type <reboot> at the command line prompt.
11) To log in, type <root> in the Name field and leave the Password field blank.

If you make any mistakes while editing the /etc/passwd file, type <:q!> to quit without saving changes. Then start over again.

Serial Port Arbitration and Apple Remote Access (2/96)

Revised: 2/8/96
Security: Everyone

Serial Port Arbitration and Apple Remote Access (2/96)

==========

Article Created: 7 March 1994
Article Reviewed/Updated: 8 February 1996

TOPIC -----

Article discusses Serial Port Arbitration and Apple Remote Access (ARA).

DISCUSSION -----

When an ARA connection is established (or being established when answering or making a call), ARA prevents other application programs from using the serial port you selected in the Remote Access Setup control panel. In this case, most programs will inform you that the port is in use.

If your Macintosh is set up to answer calls (the "Answer calls" checkbox in the Remote Access Setup control panel is selected), then other programs are allowed to use the serial port. When they are finished with the port, ARA re-enables your Macintosh to answer calls.

ARA Personal Server provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect this, remove the Serial Port Arbitrator file from the Extensions folder, restart your Macintosh, and try the program again.

NOTE: The Serial Port Arbitrator is not needed with ARA Client software. If you remove the Serial Port Arbitrator and use ARA Personal Server, you must either select, or deselect Answer calls in the Remote Access Setup control panel. Also the Serial Port Arbitrator will not work on a Macintosh if ARA Personal Server has not been installed.

AppleShare: Users & Groups Strange Entries (_SMU0000) (5/94)

Revised: 5/25/94
Security: Everyone

AppleShare: Users & Groups Strange Entries (_SMU0000) (5/94)

==========

Article Created: 7 March 1994

TOPIC -----

My Users and Groups file in AppleShare contains strange name entries such as: _SMU0000 through _SMU0099 and groups entries such as: _SMG0000 through _SMU0025. What has caused this?

DISCUSSION -----

Check to see if you have the Server Manager from TechWorks (Technology Works) installed on this machine. The Server Manager does create a duplicate users and group file called SMBasis. This file is created in order to allow the remote administration to change users and groups from another machine. Server Manager makes a private copy of the Users and Groups Data file (SMBasis) when making changes, and then swaps the temporary file with the original Users and Groups datafile when the change is complete.

This problem should be referred to TechWorks/Santorini.

Visual Effects Don't Work, HyperCard 2.2 (6/95)

Revised: 6/19/95
Security: Everyone

Visual Effects Don't Work, HyperCard 2.2 (6/95)

==========

Article Created: 7 March 1994
Article Reviewed/Updated: 16 June 1995

TOPIC ----------

I created a new button in my HyperCard 2.2 stack, and added visual effects to it using "Effect" in the Button info dialog box, but the visual effects don't appear to be working. What's wrong?

DISCUSSION ----------

In HyperCard 2.2, when Color Tools resources have been added to a stack, and the Color Tools palette is opened, the following handlers are added to the stack script:

```
on openCard
  Send colorMe to this card
  pass openCard
end openCard

on closeCard
  lock screen
  pass closeCard
end closeCard

on colorMe
  AddColor colorCard,stamp,30
end colorMe

on openStack
  AddColor install
  pass openStack
end openStack

on closeStack
  AddColor remove
```

```
  pass closeStack
end closeStack
```

As you can see, the on closeCard handler locks the screen, so unless messages have been locked in your button script, the visual effects will not be seen. Note that simply opening the "Coloring Tools" palette is what places these handlers in the home stack script; it doesn't matter whether the stack has actually been colored or not Removing the Color Tools resources does not remove these handlers.

The best solution here is to remove the black & white effect scripts from the buttons, turn on Color Tools, and use the Color Transitions menu for visual effects. You can set a transition for the entire stack, override that choice with a transition for a specific background, and then override that choice with individual transitions for individual cards within your stack.

You can use the visual effects that Color Tools provides by doing the following:

1) Select "Coloring Tools" under the "Color" menu
2) Select either stack transitions, background transitions, or card transitions from the "Effects" menu (see the Color Tools stack for more information).

Error messages such as "Can't Understand ColorMe" and Can't Understand AddColor" when opening and closing cards can be remedied by deleting the handlers from stack scripts, or use the lockmessages command. If you do lock out the commands, and you have added color to the card following the card with the button script that you edited, the color will not be there when you go to that next card. If you paste it and then come back to the card, the color will there. This is an anomoly of combining Color Tools with these locked out messages.

Color StyleWriter Pro: ColorSync Matching Methods (3/94)

Revised: 3/7/94
Security: Everyone

Color StyleWriter Pro: ColorSync Matching Methods (3/94)

==========

Article Created: 3 March 1994

TOPIC --

This article explains each of the ColorSync Matching Methods on the Color StyleWriter Pro printer.

DISCUSSION --

Photographic - Photographic matching is best for images with many different colors and shades, especially when the image included a neutral color (such as a white border). This method allows for better continuous tone changes from one color to another.

Business Graphics - Business Graphics matching is best for charts, graphs, and other images with large areas of single colors.

Spot Color - Spot Color matching works best for images that have a large area of similar colors or shades of one color, and for images that do not include a neutral color (such as a white border). This method allows continuous tone consistency with any selected color. For example, a small background color behind a heading.

AppleCD 300i Plus Drive: Specifications (Discontinued)

==========

Article Created: 7 March 1994
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article provides specifications for the AppleCD 300i Plus internal CD-ROM drive.

DISCUSSION ----------

Playback Medium

- 12 cm optical disc (any CD-ROM or audio compact disc is compatible) tray loading, no caddy required.

Capacity

- Mode 1: 656MB
- Mode 2: 748MB
- Recording surfaces: 1
- Data/block (available to user):
  - Mode 1: 2048 bytes
  - Mode 2: 2336 bytes
- Blocks per disc: more than 270,000

Audio Playback

- Playing time: more than 1 hour
- Frequency response: 20 to 20,000 Hz

Characteristics

- Rotational Speed:
  - Normal speed (1X): 230 to 530 rpm
  - Double speed (2X): 460 to 1060 rpm

- Average Access Time:
  - Normal speed (1X): 410 ms
  - Double speed (2X): 295 ms

- Data Streaming Rate, Normal Speed (1X)
  - Mode 1: 150KB/sec
  - Mode 2: 171KB/sec

- Data Streaming Rate, Double Speed (2X)
  - Mode 1: 300KB/sec
  - Mode 2: 342KB/sec

- Block Rate:
  - Normal speed (1X): 75 blocks/sec
  - Double speed (2X): 150 blocks/sec

- SCSI Bus Transfer Burst Rate (over one CD-ROM block):
  Asynchronous 2.5MB/sec
  Synchronous 2.1MB/sec

- Buffer Size: 256KB

Formats Supported

- Multisession Kodak Photo CD
  (QuickTime required)
- ISO 9660/High Sierra
- Macintosh HFS
- CD-ROM XA (requires additional ADPCM hardware to read compressed audio)
- CD+G
- CD+MIDI
- Standard Audio CDs
- CD Digital Audio Data Via SCSI Bus

Electrical Requirements

- Power Requirements:
  - +5V DC +/-5%, +12V DC +/-10%

- Power Consumption (typical):
  - 450 mA for +5V DC
  - 420 mA for +12V DC

Operating Environment

- Temperature:
  - 41° F to 122° F (5° C to 50° C)

- Relative Humidity: 5% to 90% noncondensing

Non-operating Environment

- Storage Temperature (6 months): -22° F to 122° F (-30° C to 50° C)

- Transportation Temperature (72 hours): -40° F to 149° F (-40° C to 65° C)

- Relative Humidity: 5% to 95% noncondensing

System Requirements

- Macintosh Quadra 610, 660AV, 650, 800, 840AV, 900, 950 with appropriate mounting hardware and cabling.

- AppleCD SC Setup software version 5.x or later.

AppleCD 300e Plus and 300i Plus: General Description (5/96)

Revised: 5/17/96
Security: Everyone

AppleCD 300e Plus and 300i Plus: General Description (5/96)

==========

Article Created: 7 March 1994
Article Reviewed/Updated: 16 May 1996

TOPIC -----

This article provides a general description of the AppleCD 300e Plus (external) and AppleCD 300i Plus (internal) CD-ROM drive.

DISCUSSION -----

Now your Macintosh computer can bring you into the world of CD-ROM–based multimedia with the double-speed AppleCD 300e Plus CD-ROM player. It's easy to connect and as simple to use as an audio CD player.

It can play audio CDs, but unlike a simple audio CD player, it also gives you access to the thousands of soft-ware programs, databases, educational and reference materials, QuickTime movies, clip art collections, and games now available on CD-ROM discs.

The AppleCD 300e Plus spins at double speed—the speed for which most CD-ROM titles are designed—and allows smoother playback of your QuickTime movies, video clips, and animated sequences.

The AppleCD 300e Plus also makes it possible to view photographs on your Macintosh—and use them in your documents.

This player is compatible with multisession Kodak Photo CD discs. To make your own Photo CD, just take your original film, negatives, or slides to an authorized Kodak photo processor for conversion into high-quality images on a disc. Then insert your disc into the AppleCD 300e Plus to view the images on your Macintosh. New photos can also be added to your Photo CDs at a later date.

You can connect the AppleCD 300e Plus to just about any Macintosh computer all by yourself. It attaches through the SCSI port on the back. No tools are required.

And if you have a Macintosh computer with a half-height, 5.25-inch removable-drive bay, you can have your local authorized Apple service provider (or reseller) add an AppleCD 300i Plus internal player right inside it.

Either way, your Macintosh will be equipped to bring you into the exciting, educational, and entertaining new world of CD-based multimedia.

Features

Performance

- Double-speed (up to 342 kilobytes per second) streaming data-transfer rate
- Access time of 290 milliseconds
- 256K cache and SCSI-2 inputs and outputs allow burst data-transfer rate of up to 2.5 megabytes per second

Compatibility

- Designed to work with Macintosh computers running system software version 6.0.7 or later, and Power Macintosh computers
- Connects to all computers with SCSI interface, including IBM PC compatibles and UNIX workstations
- Supports all major CD-ROM formats
- Can be shared over a network
- Plays standard audio CDs
- Exports audio CD tracks via SCSI port
- Exceeds Multimedia PC Level II specifications

Ease of use

- Loads CD via powered tray
- Set up and use in minutes
- Headphone jack and volume control (external model only)

Reliability

- Automatic lens cleaning
- Tested average life over 125,000 hours

Article Change History:
16 May 1996 - corrected spelling of SCSI-2
13 Feb 1995 - replaced entire discussion area.

Power Macintosh: DRAM Based Video Is Not Expandable (8/95)

Revised: 8/29/95
Security: Everyone

Power Macintosh: DRAM Based Video Is Not Expandable (8/95)

==========

Article Created: 4 March 1994
Article Reviewed/Updated: 29 August 1995

TOPIC ----------

Can I expand the DRAM allocated to video when using the HDI-45 port on my Power Macintosh computer?

DISCUSSION ----------

No. When using the HDI-45 connector, the computer senses the connection and automatically sets aside 640K of DRAM space for monitor support. There is no way to adjust DRAM allocation for monitor support on the following Power Macintosh models: 6100/60, 6100/66, 7100/66, 7100/80, 8100/80, 8100/100, and 8100/110.

If the monitor is connected in another way (through the DB-15 connector on an AV Video Technologies Card, or an VRAM Expansion Card on a Power Macintosh 7100/66 or 8100/80) the 640K of DRAM video allocation will become available for system use.

Article Change History:
29 Aug 1995 - Specified Power Macintosh models.
21 Mar 1994 - Clarified name of VRAM expansion card.

LW Pro 810: Reading UNIX Network Installer Utility (3/94)

Revised: 3/8/94
Security: Everyone

LW Pro 810: Reading UNIX Network Installer Utility (3/94)

==========

Article Created: 8 March 1994

TOPIC ----------

This article explains how to use the UNIX Network Utility Installer that comes with the LaserWriter Pro 810 when there is not a 3.5-inch floppy drive on the UNIX workstation.

DISCUSSION ----------

The UNIX Network Utility Installer is a tar formatted disk that is used when configuring the LaserWriter Pro 810 in a UNIX environment.

Customers who do not have a UNIX workstation with a 3.5-inch floppy drive can order the software as a QIC24 tape, or they can use a Macintosh Utility like the shareware program Suntar to read the tar formatted disk and copy the files to a Macintosh computer.

Once the files are copied to a Macintosh computer, then the files can be transferred to the UNIX host using XMODEM, Kermit, or ftp.

Ordering Information

LaserWriter Select 360: Paper-Out Lit With Envelope Tray (3/94)

Revised: 3/16/94
Security: Everyone

LaserWriter Select 360: Paper-Out Lit With Envelope Tray (3/94)

==========

Article Created: 8 March 1994

TOPIC ----------

When the optional envelope tray is attached to the LaserWriter Select 360 and I try to print, the Paper-Out LED comes on. This doesn't occur using the manual envelope feed.

How can I fix this?

DISCUSSION ----------

There is no option in the Page Setup menu to select the envelope cassette. If Universal Cassette is selected you get the paper out indication. You must select Auto Select in the Page Setup menu. You must do this because the software looks at what type of paper is being selected in the Page Setup and checks each cassette until it finds that size paper.

In order to print an envelope with the optional envelope tray on the LaserWriter Select 360, follow these steps:

1) Open the application program

2) Choose Page Setup from the File menu

3) Select envelope size (Comm 10 for business envelopes)

4) Select Landscape

5) Select OK

6) Choose Print from the File menu

7) Select Auto Select

8) Select Print

PowerBook Batteries: Types and How To Recycle (2/96)

Revised: 2/20/96
Security: Everyone

PowerBook Batteries: Types and How To Recycle (2/96)

==========

Article Created: 8 March 1994
Article Reviewed/Updated: 19 Febuary 1996

TOPIC ----------

This article describes the various batteries used in Apple portable products and how to properly dispose of a failed battery.

DISCUSSION ----------

Apple utilizes lithium, lead-acid, nickel-hydride, and nickel-cadmium batteries in our portable products. These batteries should be returned to Apple for recycling or proper disposal.

Customers can take their failed batteries to an Apple authorized service provider who can utilize the Apple Direct Air Shipping and Handling Program to return the failed batteries. Customers may not return the batteries themselves. If they do, it will be returned to them.

Authorized service providers may send failed batteries to the following address:

Apple Computer, Inc.
NiCd Battery Recycling
3011 Laguna Blvd.
Bldg. A
Elk Grove, CA 95758

Lithium Batteries

Lithium batteries require disposal when “dead,” but you cannot throw them away. In addition to being potentially explosive, lithium is water reactive, requiring these batteries to be disposed of as hazardous waste. Therefore, after removing a “dead” battery from a board, clip off the lead wires (necessary for soldered batteries) and place the battery into the zip-lock wrapper that the replacement battery was taken from. Mark the

battery “dead” and return it to Apple, where it will be disposed of following EPA guidelines.

Lead-Acid Batteries

The Macintosh Portable and Macintosh PowerBook 100 main batteries are sealed lead-acid batteries. These batteries, which contain hazardous materials (lead and sulfuric acid), should not be thrown away with regular trash. Send the Macintosh Portable and PowerBook 100 batteries to Apple for recycling. Return batteries that are not physically damaged in the same packaging that new batteries were received in. If the batteries are physically damaged (for example, leaking), do not return them to Apple. Dispose of them according to your local ordinances.

Nickel-Cadmium Batteries

The Macintosh PowerBook 140 and 170 main battery is nickel-cadmium (NiCad). The battery, which contains hazardous materials that can be reclaimed, should be returned to Apple for recycling. Return batteries that not physically damaged in the same packaging that the new batteries were received in. If the batteries are damaged, do not return them to Apple. Instead, dispose of them according to your local ordinances.

** WARNING **
Contacting the +/- terminals with metal objects such as paper clips or key chains can cause burns or start a fire. Always store the battery in its protective cover when not in use.

Nickel-Hydride Batteries

The Macintosh PowerBook Duo batteries are nickel-hydride (NiHy). These should be returned to Apple for recycling. Return batteries that are not physically damaged in the same packaging that the new batteries were received in. If the batteries are damaged, do not return them to Apple. Instead, dispose of them according to your local ordinances.

Article Change History:
19 Feb 1996 - Emphasized that only dealers are allowed to mail in batteries.
29 Apr 1994 - Clarified use of address is for authorized service provider only.
15 Mar 1994 - Added address to send batteries to.

Power Macintosh: Customer Issues Q & A (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: Customer Issues Q & A (3/94)

==========

Article Created: 8 March 1994

TOPIC -----

This article contains questions and answers related to customer issues for Power Macintosh.

DISCUSSION -----

Q) How do I briefly explain and position Macintosh with the PowerPC microprocessor?
A) Macintosh with PowerPC technology is the next generation of personal computing.
- A price/performance breakthrough based on RISC technology.
- Offers smooth migration paths for both Macintosh and PC users.
- Has excellent future growth on the Apple, IBM, and Motorola alliance.
- Introduced first in the mid to high end of product line.

Q) When should K-12 customers consider a PowerPC-based computer?
A) If a K-12 customer is currently considering a Macintosh Quadra or has cross platform needs (DOS, Windows), then the Power Macintosh would be an appropriate choice.

Q) Will a Power Macintosh "look" different than a Macintosh today?
A) The primary operating system for the Power Macintosh is System 7 the same operating system shipping with every Macintosh today. Apple is moving our mainstream operating system to PowerPC technology. Users get the power of RISC technology, familiar Macintosh user interface, and need no re-training.

Q) How do I position Power Macintosh to a DOS or Windows friendly audience?
A) Here we need to explain the advantages of making the technology leap to RISC technology, exemplifying Apple's technology leadership. Once people understand this, we can show why Apple has an excellent migration story.

Q) What sort of upgrade solutions will Apple have available at introduction, and how much will those upgrades cost?
A) Apple has stated that upgrades for Quadra and Centris models will be available at introduction. Additionally, Apple and third-party developers are working to create upgrades for other Macintosh models as well.

Q) Will important K-12 applications be compatible at introduction (for example, ClarisWorks, Mac School, HyperCard)?
A) Nearly any application that runs on current 680x0 models will be compatible on Power Macintosh. While the initial focus for native applications is targeted more towards mid-range and high-end customers, we expect most developers to start Power Macintosh projects soon if they haven't already. Claris has announced a Power Macintosh version of ClarisWorks.

Power Macintosh: Software Issues Q & A (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: Software Issues Q & A (3/94)

==========

Article Created: 8 March 1994

TOPIC -----

This article contains questions and answers related to software issues for Power Macintosh.

DISCUSSION -----

SOFTWARE ISSUES

Q) How compatible are today's applications with the PowerPC Macintosh?
A) Today's Macintosh applications should run, without modification, on Power Macintosh models. Apple expects their performance to be surprisingly responsive. In actual use, performance will range from a fast 68030 to a 68040 based Macintosh. Apple has been testing third party software at developer conferences throughout the world, as well as in our own labs. After testing over a thousand packages, we are confident that compatibility will be excellent.

Q) What about DOS or Windows?
A) Power Macintosh computers gives us a greatly improved story for DOS/Windows users. InsigniaSolutions is working on a native version of SoftPC, which they call SoftWindows, for Power Macintosh models. The PowerPC 601 microprocessor is a far better platform for their emulator than today's 68040. Consequently a DOS or Windows program can run at speeds comparable to a 486. With this technology, Power Macintosh offers a migration path for the two operating systems that really matter in the large marketplace today -— Macintosh and DOS/Windows.

Q) Will my existing peripherals work (CD-ROM, hard drives, scanners, printers)?
A) YES! AppleTalk devices (such as printers), SCSI devices (such as hard disks, scanners, and CD-ROMs), ADB devices (such as mice, trackballs and keyboards), and other Macintosh cards and peripherals are compatible with Power Macintosh. If a hardware device works with the new Macintosh

AV systems, the odds are excellent that it will work on Power Macintosh with no problems.

Q) Will PowerPC and 680x0 based microprocessor systems co-exist on the same network or environment?
A) Yes. You will be able to mix RISC based and 680x0 based Macintosh systems on the same networks, exchange files and disks between them, and enjoy all the other benefits expected from a Macintosh.

Q) Which applications will be ready at release and when will a substantial number of native applications be available?
A) Because Power Macintosh is being initially introduced at the mid to high range, areas of emphasis are business applications, high end graphics and publishing applications and higher education science and engineering applications.

Q) Will Apple be publishing a list of Power Macintosh compatible software?
A) Nearly all software that currently runs on 680x0 based Macintosh models will run on Power Macintosh. A list of exceptions is more likely than a list of compatibles, since most all applications will be running at introduction.

Power Macintosh: LAN Software Compatibility (5/96)

Revised: 5/27/96
Security: Everyone

Power Macintosh: LAN Software Compatibility (5/96)

==========

Article Created: 8 March 1994
Article Reviewed/Updated: 27 May 1996

TOPIC ----------

This article details the Power Macintosh compatibility of these Apple client and server software products:

- AppleSearch
- AppleShare family
- Apple Remote Access family
- Apple Internet Router
- A/UX
- System 7 Pro/PowerShare Collaboration Servers

DISCUSSION ----------

For each product, there is detailed information regarding compatibility at introduction for existing products, and revision schedules and distribution plans for Power Macintosh compatible upgrades. Some of these revisions coincided with the PowerPC Server introduction in May 1994.

Apple LAN Systems - Server and Client Software Compatibility

The following two tables summarize the compatibility and upgrade information. A more detailed description follows the tables.

Begin_Table

Apple LAN Systems – Power Macintosh Server Software Compatibility

PRODUCT	COMPAT. VERSION	UPGRADE METHOD	DATE AVAIL.	PRICE

AppleSearch Server	1.0.1	Patch - On AppleLink, ftp servers, or 1-800-SOS-APPL	May 94	Free
AppleSearch Trial CD	1.0.1	Patch - Delivered with AppleSearch 1.0.1 patch	May 94	Free
AppleShare 3	N/C*	Upgrade to AppleShare 4.0.2 via AppleShare Upgrade Kit Available through dealer	May 94	$699
AppleShare 4	4.0.2	AppleShare 4.0.2 Update Kit Available through fulfill-ment house	May 94	TBD
AppleShare 4	4.1	AppleShare 4.1 Update Kit Only for Power PC processor based computers. Available through fulfill-ment house.	May 95	$199
AppleShare Pro	N/C*	N/A	N/A	N/A
Apple Remote Access Multi-Port Server	2.0.1	Apple Remote Access Multi-Port Server 2.0.1 Update Kit	Jun 94	TBD
Apple Remote Access Per-sonal Server	2.0	N/A	Now	N/A
Apple Internet Router	3.0.1	Upgrades from version 3.0 on AppleLink and ftp servers or call 1-800-SOS-APPL	Now	Free
PowerShare Collaboration	1.0**	Available on AppleLink, ftp servers, and dealer channels	TBD	TBD
A/UX	N/C*	Distribution of upgrades from A/UX to PowerOpen to be announced at a later date	TBD	TBD

Product Upgrade Strategies
==========

AppleSearch

Compatibility as of Mar. 14 - AppleSearch 1.0 server is incompatible with Power Macintosh at the March 14th Desktop Introduction. AppleSearch Server 1.0 Demo Version on Trial CD is also incompatible with Power Macintosh. This is because AppleSearch Server 1.0 will only run on 68040-based Macintosh computers and the Power Macintosh 68000 emulator reports itself as a 68020.

The AppleSearch 1.0 client, running in emulation mode, is compatible with Power Macintosh on March 14th.

Power Macintosh version - AppleSearch 1.0.1 Patch will provide compatibility with Power Macintosh. Version 1.0.1 will be available as a Patch which can be installed over AppleSearch 1.0. server and will run in emulation mode on the Power Macintosh.

Version 1.0.1 will also run on 68040-based Macintosh computers, but there is no need to upgrade since there is no difference between version 1.0 and version 1.0.1 on 68040-based systems.

AppleSearch 1.0.1 Patch will be available in May 1994, and will contain two versions — one for the standard AppleSearch 1.0 server and one for the AppleSearch Trial CD.

Upgrade distribution -- AppleSearch Server 1.0.1 will be free and distributed via a Patch which will be posted on AppleLink, on Apple’s Internet ftp server, and on Service Provider’s servers. AppleSearch 1.0.1 Patch will also be added to the AppleSearch 1.0 kits for new AppleSearch purchases. The AppleSearch Trial CD 1.0.1 Patch will always accompany the AppleSearch 1.0.1 Patch.
In the United States, the AppleSearch 1.0.1 Patch will also be available, for free, directly from Apple at 1-800-SOS-APPL.

AppleShare

Compatibility as of Mar. 14 - AppleShare 3.0.3 is incompatible with Power Macintosh and is not supported by Apple. Apple recommends that all customers

wishing to run AppleShare on Power Macintosh upgrade to AppleShare 4.1.

AppleShare 4.0 and 4.0.1 servers are incompatible with Power Macintosh. Customers who wish to run an AppleShare server on a Power Macintosh computer should upgrade to AppleShare 4.1.

There are no differences between AppleShare 4.0.1 and AppleShare 4.0.2 when running on a 68040 processor based Macintosh, so there is no need to upgrade to 4.0.2 for this environment.

AppleShare 4.1 is only supported on PowerPC processor based Macintosh computers. AppleShare 4.1 shipped on many PowerPC WorkGroup Servers and is available as an upgrade for existing PowerPC WorkGroup Server customers.

AppleShare Pro is incompatible with Power Macintosh since AppleShare Pro only runs on A/UX, and A/UX does not run on Power Macintosh.

The AppleShare Workstation 3.5 (client software) is compatible with Power Macintosh on March 14th and ships with System 7.1.2 (System 7 for Power Macintosh). The same version (3.5) will also work as a client with Power Macintosh-based AppleShare servers (description to follow).

Upgrade Distribution - AppleShare 4.0.2 will be available for a nominal fee to all users of AppleShare 4.0 or 4.0.1 and will be distributed as an Update Kit in the U.S. via the Apple Order Center only. This special software kit contains the full AppleShare 4.0.2 software, but no manuals or serial numbers. A valid AppleShare 4 serial number is required to order the Update Kit.

Both the regular AppleShare 4 software kit and the AppleShare Upgrade Kit (for customers upgrading from AppleShare 2 or AppleShare 3) will be revised to version 4.0.2 and available through Apple’s standard software distribution channels.

Customers in the United States and Pacific region who buy a PowerPC Logic Board upgrade to their Apple Workgroup Server 60 or 80 will receive the AppleShare 4.0.2 Update Kit as part of the Logic Board accessory kit.

Customers in the U.S. wanting to upgrade from AppleShare 4.0, 4.0.1 or 4.0.2 to AppleShare 4.1 need to obtain the AppleShare 4.1 Update Kit (proof of 4.0.x purchase is required). The update can be obtained by calling the Apple Order Center. This program begins April 24, 1995 and ends December 29, 1995. Orders must be post marked by December 29, 1995.

Apple Remote Access

Compatibility at introduction -- AppleTalk Remote Access 1.0 Client and Server are incompatible with Power Macintosh.

The Apple Remote Access 2.0 Client and Personal Server are compatible with Power Macintosh running in emulation mode.

The Apple Remote Access MultiPort Server 2.0 is incompatible with Power Macintosh.

Power Macintosh Version -- Apple Remote Access MultiPort Server v.2.0.1 will provide Power Macintosh compatibility running in emulation mode. Version 2.0.1 is expected to ship in June 1994.

Upgrade Distribution -- Apple Remote Access MultiPort Server 2.0.1 will be available to all users of Apple Remote Access MultiPort Server 2.0 as an Update Kit via a fulfillment house for a nominal shipping and handling fee. The update kits will modify the Apple Remote Access MultiPort Server software only. No other changes are necessary. A valid Apple Remote Access MultiPort Server serial number is required to order the MultiPort Server Update Kit.

Owners of AppleTalk Remote Access Client/Server 1.0 wishing to run this software on a Power Macintosh must upgrade to version 2.0. These upgrades are available through regular Apple software distribution channels.

Apple Internet Router

Compatibility as of Mar. 14 - Apple Internet Router 3.0 is incompatible with Power Macintosh. The Apple Internet Router 3.0.1 is shipping now and is compatible with Power Macintosh running in emulation mode.

Power Macintosh Version - Apple Internet Router 3.0.1 is currently available as both a full kit for new purchases and as a Tune-Up to upgrade from version 3.0.

Upgrade Distribution - Apple Internet Router 3.0.1 is free to all users of Apple Internet Router 3.0 and is available as a Tune-up kit. The Tune-up kit provides a patch which can be installed over the Apple Internet Router 3.0. The Apple Internet Router 3.0.1 is available in the U.S. directly from Apple at 1-800-SOS-APPL, on AppleLink, and on Apple’s ftp servers. The regular Apple Internet Router 3.0.1 kits are available through Apple’s normal software distribution channels.

A/UX

Compatibility as of Mar. 14 - A/UX is incompatible with Power Macintosh.

Power Macintosh Version - Apple’s strategy is to migrate A/UX server (Apple Workgroup Server 95) customers to PowerOpen, which is based on IBM’s AIX UNIX operating system. PowerOpen availability dates have not yet been announced.

Distribution - The distribution plan for software upgrades from A/UX to PowerOpen will be announced at a later date.

System 7 Pro: PowerShare Collaboration Servers

Compatibility at introduction - PowerShare Collaboration Servers 1.0 and System 7 Pro (including PowerTalk) are incompatible with Power Macintosh at the March 14th Desktop Introduction. This is because the PowerTalk Manager needs to be revised to work with Power Macintosh.

Power Macintosh version - PowerTalk Manager 1.0.2 is required to use either

System 7 Pro or PowerShare Collaboration Servers on a Power Macintosh computer. A new Install Me First disk containing the PowerTalk Manager 1.0.2 will be available at the time of Power Macintosh introduction.

Upgrade distribution - This disk is available from the following electronic bulletin board services:

The Safe House DesignLink BBS
MacHaven BBS
America Online
Connect Inc.

Short Description Of The PowerPC 601 Processor (3/94)

Revised: 3/11/94
Security: Everyone

Short Description Of The PowerPC 601 Processor (3/94)

==========

Article Created: 8 March 1994

TOPIC ----------

This is a short description of the features of the PowerPC 601 processor which will be used for Apple Computer's first RISC products.

The organization of this description follows that of the PowerPC ISA document. Some familiarity with processor architectures, particularly of RISC processors, is assumed in the following. Since the PowerPC 601 is close to "traditional" RISC processors in many ways, the amount of detail in this document will reflect areas which are different. In areas where PowerPC (and/or the 601) are similar to normal chips, very little verbage will be spent.

DISCUSSION ----------

Architecture

The 601 is the first chip to implement the new PowerPC architecture (as described in the Version 1.01 documents). However, since it is intended as a bridge chip for IBM, it also includes the existing POWER instruction set. It is, therefore, the union of the two instruction sets.

There are several areas where the architectures differ in a rather fundamental way (for example, virtual address translation); in these areas, PowerPC prevails.

Branch Processor

The Branch Processor is logically responsible for all instruction fetching of the PowerPC architecture. It also decodes instructions to determine to which execution unit they should be sent for execution. The 601 uses pre-fetching to attempt to keep ahead of the execution units. Up to 9 instructions are contained within the Branch Processor, in a so-called "pre-fetch pipeline". In the 601, the bottom stage of the pipeline is what is normally referred to as the "Decode" stage of traditional RISC pipelines.

As instructions fall out of the bottom of the pipe (that is, proceeding from Decode to Execute, by being sent to the Fixed Point and/or Floating Point processors), the pipeline is filled by the pre-fetch logic.

Branch Instruction Processing:

The Branch Processor in PowerPC (as in POWER) "executes" all branch instructions. Note that "executing" a branch simply means to continue fetching from a different location than the current sequential stream implies. The 601 examines the last 4 stages of the pre-fetch pipeline, looking for branches.

Unconditional branches cause the pipeline stages above (and, including) the stage in which the branch is detected to be "flushed". Fetching of instructions to re-fill the pipe are then made from the "target address" of the branch. (Note that a conditional branch whose condition is determined early enough is processes the same as an unconditional branch.)

Conditional branches whose condition is not yet known when processed by the Branch Processor are "predicted". That is, instruction pre-fetching will be attempted along a path (taken vs. not taken) which is "guessed" by the hardware. In the 601, this prediction is based upon the direction of the branch (that is, the sign of its displacement). A "backwards" branch is predicted as taken; a "forwards" branch is predicted as not taken.

When the first instruction of a predicted path reaches the Decode stage (that is, the bottom of the pre-fetch pipe), and the condition is not yet known, the Branch Processor will stall, waiting for an indication of whether its prediction was correct. When the condition becomes known, the Branch Processor will either let the instruction in Decode proceed to Execute (if it predicted correctly) or flush the entire pipeline and re-fetch from the correct path.

When a branch is detected early enough, the pipe can be refilled before it would run "dry". As long as branches can be detected (and, for conditional branches, the proper direction can be determined) early enough, branches "execute" in "zero" time. In the 601, this translates into a general rule that branches which are separated by at least two non-branch instructions will execute without branch-induced delays.

In the 601, only one "predicted" conditional branch can be "outstanding" at any time.

Mini-TLB.

Code fetches have to be translated like any other memory access. In order to minimize the overhead of translating every code fetch, the Branch Processor contains a copy of the last four page translations which were most recently fetched. Any fetch to one of these pages will not cause any explicit address translation. However, when a branch is taken to a page not contained within this mini-TLB, the branch is sent to the Fixed Point Processor, which performs the address translation. The resulting translation will update one of the 4 entries in the mini-TLB.

Accesses to addresses not contained in the mini-TLB will not be attempted until the branch is known to be taken. Thus, conditional branches will incur extra delay if they are not to one of the 4 most recently used pages.

Non-Branches

PowerPC includes a group of instructions which primarily operate upon the Condition Register. They are described within the Branch Processor chapter, because they were processed by the Branch Processor in the original POWER chip-set.

However, in the 601, only branch instructions are processed by the Branch Processor. All of the other "branch processor" instructions are actually executed by either the Fixed Point Processor or the "Sequencer".

Fixed Point Processor

The Fixed Point Processor is primarily intended to execute the Fixed Point instructions of PowerPC. However, as mentioned above, the 601's Fixed Point Processor also executes most of the non-branch instructions described in the PowerPC Branch Processor chapter.

The Fixed Point Processor also performs all address translation. Thus, all loads and stores (both Fixed and Floating Point) have their address generation (that is, computing the Effective Address) and translation (converting from EA->VA->RA) executed within the Fixed Point Processor. (A complete description of Address Translation appears as a separate section in this document).

In general, all Fixed Point instructions execute in one clock, and the result of the operation is immediately avaiable to a successive instruction. The exceptions to this rule are Loads (discussed below), Multiplies (which take 5 clocks for short results and 9 clocks for long) and Divides (which take up to 36 clocks). Multply and Divide instructions actually "stall" in the Execute stage of the Fixed Point Processor, thereby preventing execution of any following Fixed Point instructions until they complete.

The important timing number of Loads is its "latency". For example, if one has a "dependent" operation, how many extra clocks are required. In the 601, assuming that the data is aligned and in the cache, one "extra" clock is required to load the register with the correct data. This implies a general rule that one should have at least one instruction between a load and any dependent instruction in order to eliminate extra clocks.

Floating Point Processor

The Floating Point Processor executes all of the Floating Point instructions of PowerPC. In general, Floating Point instructions take 3 clocks to produce a result, with the exception being FP Divide, which takes up to 31 clocks. Thus, sequences of dependent Floating Point computations will execute at 1 every 3 clocks. However, sequences of Adds, Subtracts and Multiplys which can overlap their computations so that no dependencies are within the 3 clock latency will execute at 1 per clock.

A Floating Point Add or Subtract can be "issued" every clock, as long as its sources are available. Floating Point Multiplys can be issued every other clock. A Floating Point Divide stalls the entire unit.

Note that all Floating Point Loads and Stores require processing by the Fixed Point Processor (for address computation and translation). Thus, they fill a slot in both units.

Address Translation

The 601 implements the PowerPC translation mechanism, which is different from that of the original RS/6000s and the RSC. (See the Storage Control chapter in the PowerPC Operating Environment Architecture document for details.)

The PowerPC documents define the memory structure which is used for address translation (the Hash Table). Like most processors, the 601 uses a Translation Lookaside Buffer (TLB) to "cache" recently used translations to minimize the overhead of a full "table lookup" for translations. Addresses which translate to "recently used" pages will be found within the TLB, thereby circumventing the complete process of table walking.

The 601's TLB is organized as a 2-way set-associative cache with 128 sets, using LRU updating. Thus, up to 256 translations are available with no extra processing time required. (Note: if an operating system uses the full capabilities of the PowerPC translation mechanism, no explicit "flushing" of the TLB is necessary.)

If a translation is not available within the TLB, the Sequencer is invoked to perform the actual Hash Table walking.

Cache

The 601 contains a 32 KB Unified cache, organized as 8-way set-associative, with 64 sets, using LRU updating. Each cache line is 64 Bytes, divided into two "sectors"; a sector is the unit which is processed as a single burst transaction on the bus. (The term Unified means that the cache is shared between Code and Data.)

The cache is normally run in "Store-In" (CopyBack). This means that stores are performed by updating the cache contents and marking that cache sector as "dirty". Subsequent re-use of the cache line will cause dirty sectors to be written to memory.

Sequencer

In addition to the "architected" functional units described in the PowerPC documents, the 601 also contains a micro-coded "Sequencer". This sequencer performs any of the "hard" tasks which the hardware can't. This includes such things as Loads and Stores to "I/O" space (that is, accesses where the Segment Register has its T-bit == 1), TLB misses, exception processing (that is, processing interrupts).

Note that the Sequencer is normally inactive. When it does become activated

(for example, by a TLB miss), all processing in the Branch and Fixed Point and Floating Point Processors is suspended. In other words, the Sequencer "takes over" the hardware.

(The only reason for mentioning the Sequencer is that it is referred to in various other documents.)

Power Macintosh: Audio Recording & Playback (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: Audio Recording & Playback (3/94)

==========

Article Created: 8 March 1994

TOPIC -----

How do you record audio from a camcorder or VCR into the AV versions on the Power Macintosh? These devices use a line level audio source while the Power Macintosh 6100/60AV sound in uses a mic level audio source? I'm evaluating a 6100/60AV, and I've done extensive testing but cannot get the sound to play. The video digitizes and the sound digitizes but does not play. I'm an advanced multimedia user having worked extensively with these various media sources. The speaker on the 6100/60AV works because you can hear normal Macintosh sounds from it. The 6100/60AV is configured with 16MB RAM. I've done the testing with both Fusion Recorder and native Video Vision.

DISCUSSION -----

If you try to start recording audio with the Fusion Recorder without doing anything else, the problem that is described here will occur. The sound input has to first be chosen from the Sound Control Panel in the System Folder. Select AudioVision Sound in the pop-up menu and then choose Line Level input as a selection.

QuickTime 2.0 and Audio AIFF (3/94)

Revised: 3/10/94
Security: Everyone

QuickTime 2.0 and Audio AIFF (3/94)

==========

Article Created: 10 March 1994

TOPIC -----

Does the audio side of QuickTime 2.0 use AIFF as the standard file format or do we use some other format?

DISCUSSION -----

QuickTime has its own internal audio file format. All versions of QuickTime can point to an AIFF file as a source file, but no version of QuickTime uses AIFF as a native file format.

Macintosh Display Card 24AC: Technical Specifications (12/94)

Revised: 12/21/94
Security: Everyone

Macintosh Display Card 24AC: Technical Specifications (12/94)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 21 December 1994

TOPIC ----------

This article gives the technical specifications for the Apple Macintosh Display Card 24AC.

DISCUSSION ----------

System Requirements

- To use the Apple Macintosh Display Card 24AC, you need a Macintosh II family with NuBus slot, Centris, Quadra, or Power Macintosh computer.

  Note: Certain Macintosh II family computers can use this card with an additional NuBus adapter card.

- Macintosh-compatible monitor

- Hard disk

- 2 MB of RAM or more (4 MB or more recommended)

- Macintosh System software version 7.1 or later

Operating Environment

- Temperature: 10 to 55 degrees C (50 to 131 degrees F)

- Humidity: 5% to 95% noncondensing

- Altitude: 10,000 ft. Maximum (3048 m)

Dimensions

• 6.5x4 in.

Technical Specifications

Interface: NuBus

Connector: 15-pin D-Style (RS-343A)

Display Modes: The Apple Macintosh Display Card 24AC works with any of the following monitor modes:

Macintosh Resolutions	Additional Resolutions
640x480 @ 67Hz	640x480 @ 60Hz
832x624 @ 75Hz	800x600 @ 60Hz
1024x768 @ 75Hz	1024x768 @ 60Hz
1152x870 @ 75Hz	
640x870 @ 75Hz	

Maximum Bit Depth: 24-bit (all resolutions)

Maximum Colors: 16.7 million

NuBus Power Consumption: The maximum power allowances form different voltage sources are:

Voltage	Current (A)
+5	1.8
+12	0.0
-12	0.01

Video Port Specifications

Pin	Output Signal
1	Red Return
2	Red Video
3	C Sync
4	ID 1
5	Green Video
6	Green Return
7	ID 2
8	Reserved
9	Blue Video
10	ID 3
11	C Sync and V Sync Return
12	V Sync

13	Blue Return
14	H Sync Return
15	H Sync
Shell	Shell Ground

Article Change History:
21 Dec 1994 - Added Power Macintosh to computers supporting the card.

Newton MessagePad 100: Specifications (3/94)

Revised: 3/10/94
Security: Everyone

Newton MessagePad 100: Specifications (3/94)

==========

Article Created: 7 March 1994

TOPIC ----------

This article discusses the technical specifications of the Newton MessagePad 100.

DISCUSSION ----------

Newton Recognition Architecture

- Recognizes handwriting: printed, cursive, or mixed-word recognition with the assistance of a 13,000-word built-in word list
- Allow addition of up to 1000 words by user
- Recognizes writing letter-by-letter or word-by-word
- Recognizes graphics and the inherent symmetry in objects
- Allows deferred recognition; can store notes in handwritten for later recognition

Newton Information Architecture

- Object-oriented data storage optimized for storing, finding, and linking small pieces of information
- Easy creation of custom forms applications via the flexible graphical view Toolbox
- Easy data sharing using standard tags
- Object-oriented database provides flexible view of data

Newton Communications Architecture

- Provides single interface for all communication services
- Integrated to support easy communications with minimum setup requirements
- Designed in modules to support new communications capabilities

Intelligent Assistance Architecture

- Assists users in completing repetitive tasks done in multiple categories, including communications, scheduling, finding, and reminding functions
- Contains smart defaults to reduce complexity
- Functions across applications transparently
- Allows extensions by third-party developers

Newton Hardware Architecture

- ARM 610 processor at 20 MHz
- Apple custom system ASIC
- Low-power, reflective LCD display (336 x 240 pixels)
- Transparent tablet with passive pen
- 4MB of ROM
- 640K of RAM
- One PCMCIA Type 2 card slot
- LocalTalk-compatible serial port
- Low-power, half-duplex, infrared transceiver (up to 38.4 kilo bits per second (kbps) at 1 meter)
- Protective screen lid

Communications Capabilities

- Print to Apple LaserWriters and StyleWriters with serial cable and to popular parallel printers using Newton Print Pack
- Fax with optional fax modem (9600 baud fax send, automatic cover-page generation, post-formatting)
- Send notes, name cards and appointments at up to 38.4 kbps within 1-meter (3.28 feet) using high-speed “beaming” via infrared technology
- Handle telephony needs with assistance for intelligent auto dialing (DTMF or modem dialing)
- Receive and store wireless messages using optional Messaging Card*
- Use NewtonMail* to exchange electronic mail with other Newton MessagePad users, as well as with Windows-based and Macintosh computer users with an optional modem

* This service may not be available in all countries

Size and Weight

- Height: 7.25 in. (184.75 mm)
- Width: 4.50 in. (114.3 mm)
- Depth: .75 in. (19.05 mm)
- Weight: .9 lb. (0.4 kg)

Operating Environment

- Temperature: 32 degrees to 104 degrees Fahrenheit (+0 to +40 degrees Celsius)
- Storage temperature: -4 to 117 degrees Fahrenheit (-20 to +60 degrees Celsius)
- Relative Humidity: 20 percent to 90 percent noncondensing

Power Requirements

- Power adapter:
  - -- Universal, 100 to 240 VAC, 50/60 Hz
  - -- Four plug configurations: U.S., U.K., Europe, and Australia
- Battery type: alkaline or nickel-cadmium
  - -- Alkaline output: 6.0V DC, 1.1 WH (nominal)
  - -- Nickel-cadmium output: 4.8V DC, 200 mAh (nominal)
- Lithium cell: CR2032
- Operating range: 3 V (nominal)
- Power source: Four AAA batteries (included), optional AC adapter or optional Rechargeable Nickel-cadmium Battery Pack

Connecting Kit System Requirements

- Works with PC compatible computers with 80386DX or better processors running Microsoft Windows 3.0 or later, using the Newton Connection Kit for Windows
- Works with Macintosh personal computers with 68030 or faster processors running system software version 7.1 or later, using the Newton Connection Kit for Macintosh

Printer Support

- Built-in printer support for the Apple StyleWriter and StyleWriter II, Personal LaserWriter LS and Personal LaserWriter 300 printers, and Apple PostScript laser printers from the LaserWriter Plus and up
- Works with most popular PC printers, including the Hewlett-Packard LaserJet, Hewlett-Packard DeskJet, Canon BubbleJet, and Epson LQ and FX using the Newton Print Pack option

Fax Machine Support

- Supports Group 3 fax machines

Newton MessagePad 100: Description (3/94)

Revised: 3/10/94
Security: Everyone

Newton MessagePad 100: Description (3/94)

==========

Article Created: 4 March 1994

TOPIC -----

This article describes the functions and capabilities of the Newton MessagePad 100.

DISCUSSION -----

The Newton MessagePad 100 personal digital assistant is the affordable member of the Newton family.

While it looks like the original Newton MessagePad, it has important new features that make it more powerful and more useful.

These features mean the Newton MessagePad 100 personal digital assistant can help you manage information, stay in touch via fax, e-mail, and paging, and exchange information with your computer.

It can help you stay in touch and communicate more effectively. You can send faxes and receive pages and messages. You're able to tap into on-line services or electronic mail. You can even exchange business cards via built-in infrared technology.

The MessagePad 100 can help you share and synchronize information with your Windows-based or Macintosh computer.

It can help you organize ideas, take notes, make sketches, format and print letters.

Additionally, you can expand its capabilities, with new software titles that help you keep track of your time, find your way around unfamiliar cities, and even deliver better-organized speeches.

The Newton MessagePad 100 has powerful handwriting-recognition capabilities for both printed and cursive writing. So it can transform your handwriting into

text letter-by-letter, or word-by-word. It can also leave your notes handwritten should you prefer to defer recognition until later.

As time goes by, it learns about you, your handwriting, and the way you work, helping you get more done.

It comes with a built-in-notepad, to-do list, datebook and name file to get you started. When combined with software titles offering new capabilities, the Newton MessagePad is likely to become your most treasured possession.

FEATURES

Built-in Applications

- Let you capture, organize, and communicate business and personal information
- Allow free-form notetaking, mixing handwriting, printed text and graphics
- Turn printed or cursive handwriting into typed text or leave it handwritten
- Recognize writing letter-by-letter or word-by-word
- Update daily to-do lists, help assign priority to tasks
- Let you create name files with a business-card look for hundreds people
- Help you plan monthly, weekly, and daily calendars
- Include information and productivity tools (such as time-zone maps, calculator, and currency-exchange formulas)

Communications Capabilities

- Send notes or messages, schedule appointments, or exchange business cards with other nearby Newton users via built-in, infrared beaming technology
- Print formatted letters and notes to serial and parallel printers
- Send faxes anywhere with an optional fax modem
- Receive and store wireless paging messages with the optional Newton Messaging Card
- Share your Newton information and keep files synchronized and updated with personal computers running Microsoft Windows or with Macintosh computers (requires optional Newton Connection Kit)
- Tap into electronic mail and on-line services with an optional fax modem

Intelligent Assistance

- Knows how you work and actively assists you in completing tasks
- Assists you in making phone calls, faxing, finding information, sending electronic mail, printing, scheduling meetings, and completing to-do lists

ORDERING INFORMATION

Newton MessagePad 100

Order No. H0123LL/A
- Newton MessagePad 100 personal digital assistant
- Stylus
- Batteries
- Welcome to Newton video
- Complete setup, learning and reference documentation
- Limited warranty statement

Newton MessagePad 100 Upgrade

This product will become available soon to upgrade original Newton MessagePad personal digital assistants to the capabilities of the Newton MessagePad 100.

Newton MessagePad 110: System Update and ROM Versions (5/94)

Revised: 5/16/94
Security: Everyone

Newton MessagePad 110: System Update and ROM Versions (5/94)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 16 May 1994

TOPIC ----------

This article describes the ROM and system update versions that shipped with the MessagePad 110 beginning on March 4, 1994.

DISCUSSION ----------

The Newton MessagePad 110 ships with ROM version 1.2. Installed at the factory is a system update bringing the ROM up to version 1.3. You can see which version of the system software you have installed on the MessagePad by going to the preferences screen. The version is listed at the bottom.

Starting with the release of the MessagePad 110, the version number also includes a special service control number, in parenthesis, designating the physical ROM the system update works with. For future system updates, this number will remain the same. Use this control number to identify which system update to install on your MessagePad.

The first update version number is "1.3 (344052)" and appears in the preferences screen.

The service control number in parenthesis are part of the ROM version number. If there is ever an update to the ROM, you would end up with a different ROM number. For example system software 1.31, 1.32, or 1.4.

Article Change History:
16 May 1994 - Added ROM update version information.

Power Macintosh: Description of Integrated Circuits (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: Description of Integrated Circuits (3/94)

==========

Article Created: 9 March 1994

TOPIC ----------

This article provides an overview of the various controller chips present on the Power Macintosh logic boards.

DISCUSSION ----------

Main Processor

The main processor in the Power Macintosh 6100/60, 7100/66, and 8100/80 computers is a PowerPC 601 microprocessor. The principal features of the PowerPC 601 microprocessor include:

- full RISC processing architecture
- parallel integer and floating-point processing units
- a branch manager that can usually implement branches by reloading the incoming instruction queue without using any processing time
- an internal memory management unit (MMU)
- 32 Kbit of on-chip cache memory

ROM

Power Macintosh computers contain 4MB of ROM with 100ns access time. Some of the system software that was on disk in previous Macintosh computers is in ROM in Power Macintosh models.

RAM

RAM for Power Macintosh computers is provided by dynamic random-access memory (DRAM) chips, of which the first 8MB of RAM capacity is soldered to the main logic board. Users may expand RAM capacity by adding 72-pin Single Inline Memory Modules (SIMMs) in pairs. Each SIMM contains two banks of DRAM with up to 16MB of capacity per bank.

High-Speed Memory Controller

The high-speed memory controller (HMC) is an ASIC (application specific integrated circuit) that controls all memory operations in Power Macintosh computers. The HMC has the following features that support data transfers to and from the PowerPC 601 microprocessor:

- support for all basic transfer protocols, including all single cycle accesses
- support for four-cycle 32-byte cache accesses
- translation of misaligned read actions into double-word read actions
- implementation of address-only transactions
- bus arbitration (of the address bus only)

The HMC does not support the following features:

- pipelining of memory bus transactions
- cache snooping
- recovery from transfer error acknowledge signals
- little-endian transfer mode

Apple Memory-Mapped I/O Controller

The Apple Memory-Mapped I/O Controller (AMIC) is a 160-pin gate array chip that performs most I/O logic and control for Power Macintosh computers. It supports the following functions:

- handling interrupts received through Versatile Interface Adapter (VIA) channels
- DMA for Ethernet I/O
- DMA for the SWIM III floppy disk drive controller
- DMA for the Serial Communications Controller (SCC) I/O
- DMA for Small Computer Systems Interface (SCSI) support
- DMA for sound I/O
- monitor support

The AMIC does not support the extended transfer protocols for the PowerPC 601 processor; using these protocols will cause a transfer error exception.

Data Path Chips

Two data path (DP) chips provide buffering between I/O and DRAM accesses and the cached CPU bus. They perform the following functions:

- route byte lanes between 8-bit and 16-bit I/O processes and the 64-bit CPU bus
- provide first-in, first-out (FIFO) buffering for video monitor data, which is fetched from RAM as eight-cycle bursts
- supply the Ariel II video chip with appropriate timing signals for video monitor data

The Ariel II video chip is described in the next section.

Ariel II Video Chip

The Ariel II video chip provides a color lookup table (CLUT) and digital-to-analog converter (DAC) for driving an AudioVision monitor.

SWIM III Floppy Disk Drive Controller

The SWIM III floppy disk drive controller is an extension of the SWIM II circuitry used in models such as the Macintosh Quadra 800 and Macintosh Quadra 650. It includes the following new features:

- support for DMA data transfers, which minimize use of the main processor
- no requirement that interrupts be disabled during floppy disk accesses
- support for GCR and MFM formats on 1.44MB disks
- compatibility with the manual-inject floppy disk drive

Floppy disk drives designed to be compatible with the New Age controller used in the Macintosh Quadra 840AV and Macintosh Quadra 660AV computers can easily be adapted for compatibility with the SWIM III controller.

Curio I/O Chip

The Curio is a multipurpose I/O chip that contains a Media Access Controller for Ethernet (MACE), a SCSI controller, and a Serial Communications Controller (SCC).

The SCC section of the Curio includes 8-byte FIFO buffers for both transmit and receive data streams.

Cuda Microcontroller Chip

The Cuda is a microcontroller chip. Its function is to:

- turn system power on and off
- manage system resets from various commands
- maintain parameter RAM
- manage the Apple Desktop Bus (ADB)
- manage the real-time clock
- let an external signal from either Apple GeoPort serial port control system power

AWAC Sound Chip

The audio waveform amplifier and converter (AWAC) is a 44-pin chip that combines a waveform amplifier with a 16-bit digital sound encoder and decoder (codec). It conforms to the IT&T ASCO 2300 Audio-Stereo Codec Specification and furnishes high quality sound I/O for Power Macintosh computers.

BART NuBus Controller

The BART NuBus controller chip provides the data gateway between NuBus and the CPU bus. It acts as a CPU bus master, transferring one-cycle or four-cycle transactions. It supports all NuBus burst transactions and is

compliant with the IEEE Standard 1196.

Squidlet Chip

Squidlet is a 28-pin chip that provides a set of synchronized system clocks for Power Macintosh computers.

Power Macintosh: 68LC040 Emulator (4/94)

Revised: 4/14/94
Security: Everyone

Power Macintosh: 68LC040 Emulator (4/94)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 14 April 1994

TOPIC

This article describes the 68LC040 emulator found on Power Macintosh.

DISCUSSION

The 68LC040 emulator provides an environment by which 680x0 applications can execute on a Power Macintosh computer. The emulator converts 680x0 instructions into PowerPC instructions and sends them to the PowerPC runtime environment. The emulator also maintains the emulated 680x0 environment (such as 680x0 registers).

This emulator uses the basic Motorola 68040 instruction set. However, it does not support instructions from the optional 68881 or 68882 floating-point coprocessor. Those applications which use the SANE math routines will be compatible with PowerPC systems and gain the benefit of the PowerPC's fast floating point unit.

A PowerPC implementation of System 7's Virtual Memory Manager is supported by the system. Applications that use the System 7 VM interface should work correctly, but those relying on directly accessing the 68K PMMU will break.

Note: The 680x0 emulator most resembles the Macintosh Centris 610. Applications or other software which runs on the Centris 610 will most likely run without problems under the emulator.

The emulator maintains tables which maps a 680x0 instruction to one or more PowerPC instructions. On average, one 680x0 instruction requires 10 PowerPC instructions. A PowerPC application will be slightly larger than its 680x0 counterpart because it generally takes more instructions to accomplish the same work on a RISC system than a CISC system.

Compatibility

The emulator has been designed to be highly compatible with those applications which adhere to the Macintosh programming guidelines. However, there are operational difference between the emulator and an actual 680x0 processor. The known exceptions are the following:

- No support for coprocessor's (FPU or MMU) instruction set (as mentioned above)

- The emulator will runs as fast as the system will allow. There is no attempt to maintain the same instruction timing as a 68040 microprocessor.

- The 68020 module calls, CALLM and RTM were deleted in subsequent 680x0 microprocessor. These calls are not supported by the emulator. Calling them will result in an illegal instruction exception. This should not be a problem for applications which run on 68030 or 68040 based systems.

- Within the 680x0 family, there are several instructions which have reserved fields. Although unlikely to have been intentionally done, accidental reliance on these fields may result in unexpected behavior when run under the 68LC040 emulator.

- Address error exceptions are handled differently under the emulator. A 680x0 microprocessor checks for address errors before completing the execution of a branch instruction. For performance reasons, the emulator checks after executing the branch with PowerPC systems. This may cause problems with applications which install an address error exception handler.

- Bus error exceptions are also handled differently under the emulator. Thus, applications with bus error handlers need to account for these differences.

- It may be necessary to modify some memory-mapped I/O calls to perform certain I/O accesses.

Note: For details on these compatibility issues refer to the Inside Macintosh: PowerPC System Software book. Available from Apple Programmer's Developers Association (APDA).

Power Macintosh: Mixed Mode Manager (3/94)

Revised: 3/21/94
Security: Everyone

Power Macintosh: Mixed Mode Manager (3/94)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 21 March 1994

TOPIC -----

The Mixed Mode manager is a new system level manager that handles switches between the native PowerPC and 680x0 environment.

DISCUSSION -----

Applications, device drivers, and even portions of system software which were not ported to PowerPC code will run under the 680x0 emulator. The Mixed Mode manager will make sure that the code is properly routed to the correct environment.

The Mixed Mode Manager is designed to be completely transparent to 680x0 applications. If, for example, an application makes a toolbox trap call, the Mixed Mode Manager may be invoked to call a PowerPC version of the trap, but the application is not aware of that fact.

PowerPC applications, however, will have to be aware of the Mixed Mode Manager. The Mixed Mode Manager performs the same services for 680x0 applications as for PowerPC applications. For example, a PowerPC application making a toolbox call could end up in a 680x0 implementation of the call via the Mixed Mode Manager.

More importantly for PowerPC applications is the case where the application expects to be called-back by the system, for example, with a ModalDialog filter procedure. In this case, the application must make the filter procedure Mixed Mode compatible by creating a data structure called a routine descriptor that is used by Mixed Mode when the system calls the function.

Assistance in avoiding mode switches is provided by fat traps. A fat trap is a Toolbox routine that is available in both 68000 and native implementations. The two versions are enclosed in a "routine descriptor" that tells the mixed mode manager how to call it from either environment.

Article Change History:
21 March 1994 - Added in-depth description of Mixed Mode Manager and its function.

Power Macintosh: Brief Description Of System Software (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: Brief Description Of System Software (3/94)

==========

Article Created: 9 March 1994

TOPIC -----

The Power Macintosh 6100/60, 7100/66, and 8100/80 require System software 7.1.2 and the appropriate system enabler.

DISCUSSION -----

This version of system software is based on System 7.1, with modifications to run on a PowerPC processor. It has been architected to support both 680x0 and PowerPC software. The mixed mode operation is accomplished using an efficient 68LC040 Emulator which emulate 680x0 instructions with PowerPC instructions.

If a 680x0 application conforms to the basic programming requirements imposed by System Software version 7.0 or later; it is highly probable that it will run with no problems on a Power Macintosh.

The Mixed Mode Manager handles switches between the PowerPC and 680x0 runtime environments. Note, even if a program is completely written in 680x0 or PowerPC instructions, there may be switches between runtime environments. Portions of the Macintosh Toolbox have been rewritten into PowerPC code to take advantage of the processor's speed. However, the entire Toolbox was not converted. Thus, a PowerPC application may call a 680x0 coded Toolbox routine.

A major change introduced with the new PowerPC runtime environment is a new method of organizing code and data. It is called a fragment. It can be an application, import library, or an extension. These fragments are handled by the new Code Fragment Manager. These fragments are the basis by which the Macintosh Operating System can be modernized (for example, the implementation of a microkernal).

In addition, the New Exception Manager allows applications to specify a call back routine that will be called if an exception is generated. At the very least applications will be able to make a more graceful crash. In some cases the application may actually be able to handle the exception and continue

execution.

Performa: Versions of ClickArt on computer (3/94)

==========

Article Created: 9 March 1994

TOPIC ----------

This article describes what versions of T/Maker's ClickArt come bundled with the Macintosh Performa computer and how to open the files.

DISCUSSION ----------

The spring 1993 line of Performa computers are bundled with "Best of ClickArt." These are in a MacPaint format and can be opened with the bundled ClickArt Clipout desk accessory.

The fall 1993 line of Performa computers are bundled with "ClickArt." These are in ClarisWorks 2.0 format and can be opened with the bundled ClarisWorks 2.0 application program.

Note: ClarisWorks 1.0 will not open ClarisWorks 2.0 graphic files.

Spring Line of Performa computers:
Performa 405
Performa 430
Performa 450

Fall Line of Performa computers:

At Ease 2.0: Cannot print with HP Deskwriter (8/95)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 9 August 1995

TOPIC ----------

With At Ease 2.0 for WorkGroups and a Hewlett-Packard DeskWriter 500c, the HP Print Monitor will not send documents to the printer. Documents print fine from the Finder, just not while in At Ease 2.0. Why?

DISCUSSION ----------

The problem is not with At Ease, but with the version of the DeskWriter printer driver that is installed. Customers with versions earlier than those listed below need to contact Hewlett-Packard to get updates.

Hewlett-Packard's phone number can be found by using Hewlett-Packard Co. as the search string.

Begin_Table

Printer	Printer Driver Version
DeskWriter C	3.0
DeskWriter 550c	2.0
DeskWriter	3.9

End_Table

Latest HP drivers are also available through HP dealers who can download it from the HP email system or CompuServe (Go HPPER).

Macintosh Quadra 840AV: Horizontal Line in Captured Video (3/94)

Revised: 3/10/94
Security: Everyone

Macintosh Quadra 840AV: Horizontal Line in Captured Video (3/94)

==========

Article Created: 10 March 1994

TOPIC ----------

When displaying live video from a video camera, or in a captured frame or movie on a Quadra 840AV there appears to be a horizontal line going through the image. It is more noticeable on curves or diagonal lines in the image.

The line stays in the same position so it doesn't appear to be a sync problem. I don't seem to get the same problem when capturing from a VCR. Is this a known issue?

DISCUSSION ----------

What you are seeing is a scaling artifact, and is normal in some situations. It may be seen whenever an image is scaled vertically; but it should be most noticeable when the image is scaled vertically so that it is smaller than full size and greater that half.

The scaler works by low-pass filtering and subsampling. In the vertical dimension, this means that some of the horizontal scan lines are dropped, but the data contained in the dropped lines is averaged into the remaining lines. This averaging minimizes the dropped line effect, but it is not perfect; it is an approximation of perfect (you may see perfectly scaled images on television, but the equipment that does this costs thousands more than the entire computer).

In the case where an image is scaled vertically by less than full but greater than half, the image displayed on the screen consists of two video fields interlaced onto the monitor. The video scaling processes fields and it takes two fields to make a frame. When a line is dropped in one field, the corresponding line in the opposite field is also dropped. When the two fields are reconstructed on the display, the effect is that two vertically adjacent lines are dropped, and this can be visible in some cases.

The most likely reason it is not as visible when using a VCR is that the

image from a VCR is lower resolution from the filtering done in the recording process. The artifact is still there, but the lower resolution hides it.

Apple Multiple Scan 20 Display: Specifications (10/95)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 17 October 1995

TOPIC -----

This article gives the technical specifications for the Apple Multiple Scan 20 Display.

DISCUSSION -----

Picture Tube

- 20-inch diagonal Trinitron CRT
. Minimum viewable area: 292.6 mm x 388.4 mm (11.52-inch x 15.29-inch)
- Multiple scan
- Resolution range: 640x480 to 1280x1024

Screen

- .31 millimeter (mm) pitch (Rev A)
- .26 millimeter (mm) pitch (Rev B)
- Bonded glass panel with antiglare/antistatic multilayer coating

Input Signals

Red, green, and blue signals; separate sync, composite sync, and composite video

Power Savings feature

Conforms to the Energy Star program of the United States Environmental Protection Agency

User Controls

- Power-on switch

- Automatic degauss at power-up; manual degauss by turning power switch
. off, then on (capable of full degauss after monitor is turned off for
. 20 minutes or more)
- Control buttons: Reset, Control, Command, Brightness, Contrast
- Additional picture controls available using the Command button:
. horizontal and vertical shift, horizontal and vertical size,
. rotation, horizontal and vertical convergence, and color temperature

Begin_Table

Active Video Image Area

Adjusted at the factory for the following standard modes:

Mode	Resolution	Vertical Refresh Rate (hertz)	Horizontal Scan Rate (kilohertz)
VGA	640x480	59.95	31.47
Macintosh	640x480	66.7	35.0
VESA	640x480	75.0	37.5
VESA	800x600	75.0	46.9
Macintosh	832x624	75.0	49.73
Macintosh	1024x768	74.93	60.24
VESA	1024x768	75.0	60.02
Macintosh	1152x870	75.0	68.7
VESA	1280x1024	75.0	79.98

End_Table

Input Electrical Requirements

- Voltage: 90-132, 198-264 V
- Frequency: 47-63 Hz
- Power: 180 W maximum (Rev A)
  165 W maximum (Rev B)

Weight

Approximately 66 pounds (30 kilograms)

Dimensions

- Height: 474 mm +/- 5 mm
- Width: 474 mm +/- 5 mm
- Depth: 501.5 mm +/- 5mm

Tilt Swivel Base

- Tilt: -5 to +15 degrees
- Swivel Range: +/- 45 degrees minimum

Interfaces

Apple Desktop Bus (ADB): one input port and two pass-thru output ports

Operating Environment

Temperature

- Operating: 10 to 40 degrees C (50 to 104 degrees F)
- Storage: 0 to 60 degrees C (32 to 140 degrees F)
- Shipping: -40 to 60 degrees C (-40 to 140 degrees F)

Humidity (noncondensing)

- Operating: 10% to 80%
- Storage: 5% to 90%
- Shipping: 5% to 95%

Altitude (maximum)

- Operating: 10,000 ft. (3048 m)
- Shipping: 35,000 ft. (1067 m)

Safety

Meets strict SWEDAC MPR-2 requirements for low-frequency (ELF and VLF) magnetic and electric emissions.

System Requirements

- Power Macintosh, Macintosh Centris, Macintosh Quadra, or any NuBus compatible Macintosh with a Macintosh Display Card 24AC.
- Macintosh II family, PowerBooks, Duo Dock* and MiniDock, Macintosh Performa, Macintosh LC, LC II, LC III, and Macintosh computers with 8•24, 8•24GC, 4•8 video cards installed work in the 640x480 video mode. Other modes are possible with additional adapters.
- System software version 7.1 or later

* - The Duo Dock requires a video display adapter to change resolutions unless System 7.5 is installed.

Article Change History:
17 Oct 1995 - Updated Rev. B specifications.
10 Oct 1995 - Added Rev. B specifications.

SoftWindows: Hard Disk File C (1/95)

Revised: 1/17/95
Security: Everyone

SoftWindows: Hard Disk File C (1/95)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 17 January 1995

TOPIC --

What is the Hard Disk File C in my SoftWindows folder? Can I delete it? Can I make it smaller?

DISCUSSION --

The Hard Disk File C is actually file where all of your MS-DOS and Windows applications and files are stored when running under SoftWindows. It is in fact your virtual hard drive when using SoftWindows. Deleting it causes you to lose everything installed or saved in on drive "C" while under SoftWindows.

The Hard Disk File C is created upon installation of SoftWindows and cannot be changed dynamically. It should be considered as a hard drive, and like a hard drive, would need to be reformatted to make specific partition changes (making it larger or smaller).

You can create a Macintosh Shared folder as another drive, and copy the contents of C into the newly created drive. You are then able to delete, and then recreate the "C" drive the exact size you want. If you delete the Hard Disk File C, you should also throw-away the SoftWindows Prefs file, located in the Preferences folder in your System folder.

Double-clicking on the Hard Disk File C launchs SoftWindows.

Article Change History:
17 Jan 1995 - added removing the SoftWindows Prefs file.

Performance Tips for SoftWindows (3/94)

Revised: 3/11/94
Security: Everyone

Performance Tips for SoftWindows (3/94)

==========

Article Created: 9 March 1994

TOPIC ----------

Here are some recommendations for SoftWindows setup when comparing the speed to a PC.

DISCUSSION ----------

If you're comparing SoftWindows with a 4 MB PC:

- 16 MB of RAM on the Power Macintosh is the minimal configuration.
- Set the Monitors control panel to 256 colors.
- In the Memory control panel, turn Modern Memory manager ON, Virtual Memory OFF, reduce Disk Cache to the minimum.
- Set SoftWindows' application size to 12000K.
- Launch SoftWindows
- Select PC Memory under the Setup Menu
- Set Expanded Memory (EMS) to ZERO, and Extended Memory (XMS) to 3 MB or 4 MB (this will leave between 1 MB and 2 MB of RAM unused, but will improve performance significantly).
- In Windows Desktop, set the size to 640X480, with 256 colors.

If you're comparing SoftWindows with a PC that has 8 MB RAM (or more):

- The Power Macintosh should have a minimum of 24 MB of RAM.
- Set the Monitors control panel to 256 colors.
- In the Memory control panel, turn Modern Memory manager ON, Virtual Memory OFF, reduce Disk Cache to the minimum.
- Set SoftWindows' application size to 18000K.
- Launch SoftWindows.
- Select PC Memory under the Setup Menu
- Set Expanded Memory (EMS) to ZERO, set Extended Memory (XMS) to 10 MB (this will leave about 2 MB of RAM unused, but will improve performance significantly).
- In Windows Desktop, set the size to 640X480, with 256 colors.

Additional Speed Tips:

1) Use the HPV video in the 7100 or 8100.
2) Add a cache card if you're using a 6100 or 7100, for a boost of about 20%.
3) Install a fast hard disk (such as a 1 GB drive) to significantly boost Windows performance in general, and database access in particular.

NOTE: Some applications may require even more RAM than the minimum stated.

The difference in performance between the worst settings and optimum settings can be more than 100%.

DISCUSSION ----------

Try the following:

1) Open the Chooser under the Apple Menu and choose the printer you want to use
2) Open the ReadMe in found in the SoftWindows folder (open with SimpleText)
3) Choose Print from the File Menu

If your document successfully prints, then continue with the next instructions. If not, then make sure your printer is on, double-check your network connection, and ensure that you have the correct printer drivers installed.

4) Launch SoftWindows
5) Under the Setup menu, choose printer
6) Make sure "Epson LQ 2500" is selected
7) Make sure that within the DOS or Windows application that the "Epson LQ" or "Epson Basic" is also selected

SoftWindows: CD ROM Problems (3/94)

==========

Article Created: 9 March 1994

TOPIC --

I'm using SoftWindows on my Power Macintosh and am trying to use a DOS CD-ROM. I can't seem to get it to work, what could be wrong?

DISCUSSION --

Try the following:

1) Launch SoftWindows
2) At the C:\> prompt, type 'usecd' (don't type the quotes) and hit Enter
3) Insert the CD

If this fails, then remove the file "Foreign File Access" from your Macintosh System folder and restart. Repeat items 1-3 again.
If that continues to fail, then do the following:

1) Put the "Foreign File Access" file back into your System Folder
2) Restart
3) Insert the CD (it should appear on the Desktop. If it does not, then you may have a bad CD)
4) Under the Setup menu, select "Mac/PC Shared Folders..."
5) Find the CD on the Desktop
6) Select the drive you want the CD mounted to (for example: G:\ )
7) Click on "Use Macintosh HD" button at the bottom of the dialog

You should now be able to access the files on the CD from SoftWindows.

Note: you can only use one CD-ROM drive under SoftWindows.

SoftWindows and the DOS Compatibility Card (3/94)

Revised: 9/29/95
Security: Everyone

SoftWindows and the DOS Compatibility Card (3/94)

==========

Article Created: 9 March 1994
Article Reviewed/Updated: 28 September 1995

TOPIC ----------

How does SoftWindows and the DOS Compatibility Card compare as far solutions for running DOS on a Macintosh?

DISCUSSION ----------

The Macintosh Quadra 610 DOS Compatible and the SoftWindows bundle on the Power Macintosh are complementary approaches to provide cross-platform compatibility solutions. The Macintosh Quadra 610 is the only Macintosh that supports the DOS Compatibility Card. The Macintosh Quadra 610 DOS Compatible includes both a Motorola 68040 and an Intel486sx microprocessor enabling customers to run Macintosh, DOS and Windows software concurrently. It comes with MS-DOS 6.21. The DOS Compatible Card does not provide NetWare, or any network support.

SoftWindows is a native Power Macintosh application that runs solely on the Power Macintosh Computers. It emulates the 80286/287 microprocessors, and provides application performance comparable to the speed of entry level 386 to 486 personal computers when running DOS and Windows applications. It comes with MS-DOS 6.21 and Windows 3.1. SoftWindows also provides PC network support such as Netware, LAN Manager, Windows NT Server, and TCP/IP.

SoftWindows on the Power Macintosh: Description (3/94)

Revised: 3/11/94
Security: Everyone

SoftWindows on the Power Macintosh: Description (3/94)

==========

Article Created: 9 March 1994

Power Macintosh with SoftWindows provides the increased performance of RISC microprocessing and the compatibility of Macintosh, DOS and Windows software.

SoftWindows is a native PowerPC application developed by Insignia Solutions which emulates a 80286 microprocessor and allows Power Macintosh computers to run MS-DOS and Windows applications at speeds of entry-level 386 and 486 personal computers.

SoftWindows 1.0 runs on Power Macintosh Computers only, and is not compatible with any 68000 processor. SoftPC is available from Insignia for MS-DOS solutions on a 68000 based Macintosh.

Processor emulated:	Intel 80286, and Math Co-processor 80287
Performance:	Speeds estimated between 386SX to 486SX (depending on the application)
Video Supported:	CGA (Color Graphics Array), EGA (Enhanced Graphics Array), and VGA (Video Graphics Array)
Memory:	640K Plus expanded and extended memory (up to 64 MB)
Dos:	Version 6.21
Windows:	Version 3.1
Networking:	Novell NetWare 3.11 Client, LAN WorkPlace for DOS, LAN Manager, Windows for Workgroups, and TCP/IP
Applications:	Tens of thousands of compatible applications for Windows, DOS and network applications are compatible
CD ROM:	PC CD ROM support
Minimum RAM:	Requires a Power Macintosh with a minimum of 16 MB RAM. Compatible with Virtual Memory

SoftWindows uses the Macintosh hardware to emulate a full range of PC devices including: COM, LPT ports, floppy drives, memory systems, video displays and the CD-ROM.

SoftWindows 1.0 Capabilities

Users can:

- Run Windows and DOS applications
- Run MS-DOS Shell
- Print from a DOS or Windows application
- Print to all Apple-compatible printers
- Print to a PC printer such as a HP LaserJet via the serial port
- Have support of PC-formatted CD-ROMs on all Apple-compatible CD-ROM drives
- Copy and Paste between Macintosh and PC applications (text and graphics supported in both directions)
- MS-Video/Windows-No audio support however
- Launch Windows from a server
- Share the Macintosh file system (up to 22 shared folders or Drives E: through Z:)

Performance

SoftWIndows will provide Power Macintosh customers with DOS and Windows application performance that is comparable to the speed of entry-level 386 and 486 personal computers (without a Math Co-processor). This will depend on the Power Macintosh system and configuration, as well as the specific applications used.

Compatibility

SoftWindows runs virtually all DOS and Windows applications in standard mode. Some Windows applications require a 386 processor to run in Windows enhanced Mode. Programs running in Windows Enhanced Mode will not run on version 1.0, but will be supported in later versions.

Support

Power Macintosh computers are supported by the Power Macintosh group at Apple Assurance. SoftWindows is supported by the publisher, Insignia Solutions. Search on Insignia Solutions to find specific company information.

SoftWindows Upgrade

Registered users of SoftPC and SoftPC Professional can upgrade to SoftWindows for $149; registered users of SoftPC with Windows can upgrade for $99 (pricing pertains to North American customers). Upgrades are available from Insignia Solutions.

• What's New in SoftWindows
• Memory settings - for best performance
• More Performance Tips - Getting the best out of SoftWindows
• Other Tips
• SoftNode - Networking Support for SoftWindows
• CD ROM Support
• AccessPC compatibility
• External floppy drive support
• Miscellaneous
• Acknowledgements
• Your Comments Please

2. What's New in SoftWindows
==========
This is the first version of SoftWindows for the Power Macintosh. If you are familiar with the SoftPC family of products for the 68k Macintoshes, then these are the key features introduced in SoftWindows:
• It's fast - running at entry level 486 speeds. This is achieved through: - being a PowerPC native application which takes full advantage of the performance of your Power Macintosh - Insignia's advanced emulation technology - Having access to the source code of Windows from Microsoft, which enables us to modify Windows to give extra speed, without jeopardising compatibility.
• Improved SmartCopy - the Windows utility that links the Macintosh and Windows clipboards now allows bi-directional transfer of text and bitmap graphics data between PC and Macintosh applications.
• Improved networking - the list of supported network operating systems now includes Banyan Vines, so you can connect to Novell NetWare, LAN Manager, LAN

Server, Windows NT Advanced server, and Banyan Vines servers. Also, using Novell's LAN Workplace for DOS, you can connect to UNIX fileservers through TCP/IP.
• Improved PC CD ROM support - Audio CD support is better and dual format CDs are supported.

3. Memory settings - for best performance
==========
The amount of memory that you dedicate to SoftWindows is set up by the SoftWindows installer, depending on the options you select during installation.

This determines three key features:
i) The maximum amount of PC memory available to your PC applications
ii) The maximum size and depth you may specify for the Windows desktop
iii) The performance of SoftWindows.

Stated simply, the more memory you give to SoftWindows, the better it will be. However, devoting a large portion of your Macintosh memory to running SoftWindows will limit your ability to run other Macintosh applications simultaneously.

If you want to dedicate more memory to SoftWindows:
• Make sure SoftWindows is not running: Quit SoftWindows if it is.
• Select SoftWindows in the Finder by clicking its icon once.
• Select “Get Info” from the Finder's File Menu
• Enter a higher number in both the Minimum and Preferred Size boxes.
• Click the close box for the dialog.
If you have given too much memory to SoftWindows, go through the above procedure typing a smaller number into the Minimum and Preferred Size boxes.

To see the effect of your changes, select PC Memory… from the SoftWindows Setup menu. The size of the “DeltaCache” (which controls the SoftWindows performance - bigger is better) is displayed in the top right hand corner of the dialog. This should be between 0k (slowest) and 1024k (fastest). For some applications, there is an extra performance boost with a DeltaCache of 2048k. Additional DeltaCache beyond 2048k will have little effect on SoftWindows performance.

4. More Performance Tips - Getting the best out of SoftWindows
==========
• Make sure that SoftWindows is set up to use at least 3Mb of PC Extended memory, by using the PC Memory… command from the SoftWindows Setup menu. Windows runs much better with 3Mb rather than the minimum 1Mb of extended memory - even on a hardware PC.
• Make sure the setting in your Macintosh “Monitors” Control Panel matches the number of colors you have selected for the Windows Desktop. This is displayed by selecting the Windows Desktop… command from the SoftWindows Setup menu.
• Make sure the Windows Desktop is entirely on one monitor.
• Make sure the Windows Desktop is unobscured by other windows.
(Note that when the Windows desktop is in an optimal position, the title bar will have a check mark (√) appended. If there is no title bar then holding down Command and option keys will display a hand icon with a dot in the middle).
• Try boosting the DeltaCache to about 2048k, as described above.
• Try turning File Sharing off, it can slow down your applications on the Power

Macintosh.
• Make sure you do not have the MacsBug debugger installed - it slows down the entire Power Macintosh.

5. Other Tips

5.1 Loading DOS High

In order to maximize the amount of available conventional memory to PC applications, you may load DOS high by adding the line

```
DOS=high
```

to the CONFIG.SYS file.

5.2 DoubleSpace

DOS 6.2 is supplied with the DoubleSpace utility which enables the available disk space on a SoftWindows hard disk file to be doubled. Type "HELP DBLSPACE" at the DOS prompt for more information.

6. SoftNode - Networking Support for SoftWindows

6.1 Ethernet card compatibility

SoftNode is compatible with the on-board Ethernet fitted in all Power Macintoshes and virtually all Macintosh Ethernet cards.

If you are using third party Ethernet solutions, please ensure with the manufacturer that you have the latest version of the driver software.

The Apple Ethernet NB card has had a number of problems in the past. These are all believed to be addressed in version 1.4.2 of Apple's Network Software Installer disk.

SCSI based Ethernet - A number of SCSI Ethernet adapters have drivers which pad out the packets of the Ethernet II frame type. This causes illegal instructions in PC applications using this frame type, although other frame types work well. If it is not possible to use a different frame type, this problem may be solved by connecting via a SoftNode Ethernet Gateway for IPX protocols. This applies to the Focus Nuvo-Link SC and to Dayna's DaynaPORT SCSI/Link products.

6.2 Token Ring card compatibility

SoftNode is compatible with Token Ring cards which support the Apple .TOKN standard. At the time of writing, only the Apple 4/16 card works, and it has some restrictions. Other third party cards are likely to be fixed by the time the Power Macintoshes are available. These include cards from DCA, Asanté and CableTron (which work in SoftPC on today's 68k Macintoshes). Please contact the relevant manufacturers to check on the PowerPC compatibility of their cards.

The driver for Apple's Token Ring cards does not support the Token Ring 802.2 frame type. However, Apple are aware of the problem and a fix is expected from

Apple shortly.

You can use SoftNode in an environment where other cards are installed by:

- installing a supported card in one Macintosh
- installing a SoftNode Token Ring Gateway on that Macintosh
- using the SoftNode ATALK.BAT batch file from other Macs to access the Novell file server via the SoftNode Gateway

6.3 Windows for Workgroups Support

There is a problem with two files in the \INSIGNIA\SOFTNODE directory on newly created SoftWindows hard disks. The files NET.WFW and NET.WFT are example NET.CFG configuration files for using Windows for Workgroups client software over Ethernet and Token Ring respectively. Both contain the line:

```
protocol IPX 0  ETHERNET_802.3
```

instead of the line:

```
protocol SMB f0  ETHERNET_802.2
```

This stops Windows for Workgroups working when the Network Control Panel is set up to use the Ethernet or Token Ring card for AppleTalk. There is no problem if the Network Control Panel is set up to use LocalTalk.

To fix the problem, you must replace the first line with the second line, or if you need simultaneous NetWare and Windows for Workgroups support, you may add the second line to the file, immediately after the first line.

7. CD ROM Support

Audio CD ROM support is much improved over previous versions of SoftPC. In addition, it is now possible to use CD ROMs that have both a Macintosh (HFS) partition and a PC (ISO 9660) partition. Use of these hybrid CDs requires that you have a CD ROM driver that is capable of accessing both partitions. The Apple CD ROM driver is not one of these, but Insignia's RapidCD product will replace the Apple CD driver to enable this functionality. FWB's CD ROM Toolkit is also compatible.

8. AccessPC compatibility

Insignia's AccessPC product allows you to mount SoftPC hard disk files on the Macintosh desktop so that you can see the DOS files and directories as documents and folders. Version 3.0.2 of AccessPC also allows you to mount SoftWindows hard disk files. If you have an earlier version (3.0 or 3.01) you may patch it to give this extra feature. Simply run the application called “PatchAccessPC” which is on the first SoftWindows installation disk and follow the instructions in the subsequent dialogs. Note that the AccessPC control panel should be closed when you patch it, and you will need to restart the Macintosh afterwards.

9. External floppy drive support

At the time of writing, the only diskette drive that may be set up as SoftWindows A: or B: drive is the internal FDHD drive (also known as the “SuperDrive”) in the Power Macintosh. Other diskette drives supplied by third party manufacturers work with SoftPC on 68k Macintoshes and are expected to work as soon as the drivers for these devices are fixed to work on Power Macintoshes.

Since every Power Macintosh is equipped with a SuperDrive, lack of support of 3rd party 3.5" drives is not expected to be a big issue. If you really need to use 5.25" PC diskettes, the DaynaFile drives from Dayna Communications and the DOSFloppy from PLI work with SoftPC on 68k Macintoshes. No information is currently available for when these devices will work on Power Macintoshes.

10. Miscellaneous

10.1 Tutorial Error

Some configurations of SoftWindows are NOT supplied with a tutorial diskette. If this is the case, you may install the tutorial application from your SoftWindows hard disk. To do this, you should choose Run… from the Windows Program Manager File menu, and type C:\WNPST\SETUP in the command line field and click OK. (The manual incorrectly uses the WINPST directory instead of the WNPST directory).

10.2 Windows Desktop Size

Note that changing monitors, or monitor resolutions, between invocations of Windows, can lead to a Windows Desktop which is larger than the current monitor size. This may be fixed by manually resizing the Windows desktop from the SoftWindows Setup menu. The changes will take effect the next time Windows is run.

11. Acknowledgements

11.1 WinPost

The tutorial Windows application supplied with SoftWindows is WinPost, by Eastern Mountain Software. Please note that this is a shareware version of WinPost: if you decide to continue using it, please send the registration fee of $30 (USA/Canada/Mexico) or $35 (all other countries) to
Eastern Mountain Software, P.O. Box 6394, Bellevue, WA 98008-0394, USA.
Telephone: (206) 391-3483.

11.2 DEVLOD

SoftWindows is supplied with a version of DEVLOD.COM from "Undocumented DOS" by Schulman et al. (Addison-Wesley, 1993). Copyright (c) 1993 Andrew Schulman, Ralf Brown, Jim Kyle, David Maxey, Ray Michels.

11.3 DOS for Dummies/ Windows for Dummies

The SoftWindows User Guide is not intended to be a reference guide for using DOS and Windows. If you need a DOS or Windows reference, we recommend DOS for Dummies by Dan Gookin and Windows for Dummies by Andy Rathbone, both by IDG

books. These excellent books are used and recommended by the Insignia Technical Support specialists who are certainly not “dummies”!

12. Your Comments Please

The SoftWindows User Guide has details of how to contact Insignia's Technical Support or Customer Service departments. Please contact these departments if you have any problems with the software or wish to get further product information.

If you have any comments about the SoftWindows software or documentation, please send them by letter, fax or AppleLink to:

LC 575, Quadra 650: Maxtime Cable Message Upon Startup (6/94)

Revised: 6/29/94
Security: Everyone

LC 575, Quadra 650: "Maxtime Cable" Message Upon Startup (6/94)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 29 June 1994

TOPIC ----------

In booting up a Quadra 650 or Macintosh LC 575, a message that says "Sending handshake byte in postburn. Please plug in Maxtime cable for postburn." may be generated.

This article describes how to get rid of this message.

DISCUSSION ----------

This message occurs when the burn-in software is not erased off of the hard drive at the factory prior to shipping.

To remove the software:

1) Boot from the Disk Tools diskette or the InstallMeFirst CD.
2) Trash the files in the Startup Items folder.

Or another alternative is to reinitialize the drive and reinstall system software.

Article Change History:
14 April 1994 - Added Quadra 650 to the article title and discussion.
29 June 1994 - Cleaned up the discussion.

JLK 1.0: Compatibility with Overseas Power Macintosh 1/96

==========

Article Created: 3 May 1994
Article Reviewed/Updated: 26 January 1996

TOPIC ----------

This article describes a problem with the Power Macintosh and Japanese/Chinese Language Kit (version 1.0) installer in Japan. This does not affect Power Macintosh computers running version 1.0 of the Japanese/Chinese Language Kits in the United States. The Power Macintosh and the Japanese/Chinese Language kits version 1.0 are compatible in the U.S.

DISCUSSION ----------

Version 1.0 of the Japanese Language Kit installer will replace the NuScript manager with an old version. Version 1.1 of JLK/CLK is available internationally to fix this problem. This issue does not affect the systems used in the United States in any way.

Article Change History:
26 Jan 1996 - Made minor technical updates.
03 Mar 1995 - Changed title slightly, added Japanese Language Kit 1.1.
03 May 1994 - Updated article to reflect this as an international issue, not a U.S. issue.

Power Macintosh: Run Time Environment (3/95)

Revised: 3/6/95
Security: Everyone

Power Macintosh: Run Time Environment (3/95)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 6 March 1995

TOPIC ----------

This article provides a technical description of the Run Time Environment and the switch from the 680x0 segment loader to the new Code Fragment Manager.

DISCUSSION ----------

A run-time environment is a set of conventions that determine how code and data are loaded into memory and managed. The PowerPC run-time environment is significantly different from the one provided in 680x0-based Macintosh System Software. Fortunately, this change is for the better. The most significant change is the use of fragments to organize code and data in memory. Fragments can be an application, import library (such as system software), or extension. Fragments provide the following benefits:

• Fragments let software in import libraries be easily shared with other programs.

• Fragments provide a simplified means for all software components to address global data. With 680x0 systems, it was provided only for applications.

• The use of fragments is one of the elements that allow future modernization of the Macintosh operating system. It lets new system features such as a microkernal be easily implemented.

Fragments

A fragment is a method of organizing code and data. Fragments can loosely be categorized into three areas:

• An Application is a fragment launched by the user.

• Extensions are fragments which extend the capabilities of other fragments.

• Import library -- These fragments can be shared with other fragments. System software is an example of this type of fragment. Since this fragment can be shared, an import library is also referred to as a shared library. In addition, since import libraries are linked dynamically at application launch time (that is, not when the application was created or installed), they are also referred to as dynamically linked libraries.

At application launch time, the Code Fragment Manager makes sure all the necessary fragments are loaded to memory and prepared for execution. This manager uses the Code Fragment Loader to perform the loading into memory.

Fragment Storage

The physical storage for a fragment is called a container. A container can be any logically contiguous memory location such as a data fork of a file, Macintosh ROM, or a resource.

PowerPC executable code is stored in the data fork of the application file. A 'cfrg'0, is added to the resource fork to indicate that this application is a PowerPC application. In contrast, 680x0 applications place executable code as 'CODE' resources in the resource fork.

This arrangement of code and resources allows the creation of a single application that can run on both 680x0- and PowerPC-based Macintosh computers. By combining the two structures together, you get what is called a fat application.

Fat Applications

If a fat application is executed on a 680x0-based Macintosh computer, the system software ignores the 'cfrg'0 resource because it is an unknown type and loads just the 680x0 'CODE' resources. If executed on a Power Macintosh, the system software recognizes the 'cfrg'0 resource and loads the PowerPC code from the data fork.

A fat application is very useful when supporting mixed 680x0 and PowerPC environments. However, it may not be desirable to have a fat application. For example, there may be cases where the 680x0 performance is insufficient to run the application. In this instance, a 'CODE' resource should be installed so when the PowerPC-only application is run on a 680x0 system, a dialog box shows up to explain the situation.

A developer can distribute a single fat application. With Installer 4.0, the user has the option of installing only PowerPC or 680x0 executable application or both.

Import Library

==========

An import library (shared library or dynamically linked library) makes applications be smaller. Since import code is loaded dynamically at application launch time, this code does not have to be part of the application. If only one application utilizes this library, there is little advantage unless the import library is stored in ROM (like system software).

The big advantage of an import library is when multiple applications utilize the same import library since a library is loaded into memory only once. Thus, several applications can have access to the library, without each having to have the RAM overhead to support the functionality.

In addition, centralizing functionality lets updates be made easily. By changing only one set of code, many applications are updated simultaneously.

An import library can be created for such sharable functions such as a spell checker. In addition, it can be used to support infrequently used application functions. The Code Fragment Manager can load these functions on demand after application launch. This results in smaller RAM usage and quicker launching.

Memory Organization

==========

The organization of memory in the PowerPC run-time environment is reasonably similar to the 680x0 environment. The system partition occupies the lower memory addresses while applications take the remaining space starting at the higher memory addresses. As with the 680x0 application partition, the Process Manager allocates space for a stack, heap, and global variable space.

The main difference between the PowerPC and 680x0 memory organization is the location of an application's code section and global variables. This difference varies depending on whether the Power Macintosh has virtual memory turned on or not.

In 680x0 environment, virtual memory uses a single monolithic file on a single volume as backing store. This backing store is mapped to a virtual memory address space. Its size is set via the Memory Control Panel. Unused pages of memory are written to this backing store and loaded into main memory as needed.

This backing store is necessary because the Resource Manager is not re-entrant. Since 68K code is found in code resources in the resource fork of an application, it is accessed by the Resource Manager. However, since it is not re-entrant, the manager cannot be accessed at an interrupt level. Therefore when a page fault occurs, the code must be written to the system wide backing file because it cannot be retrieved from its original location.

A backing store sometimes prolongs the launch of an application. This occurs when an application’s code is loaded into main memory only to be immediately written out to the backing store file.

This virtual memory delay is eliminated by the use of a scheme called file

mapping. The Virtual Memory Manager uses the data fork of the application as the paging file. The entire code fragment is mapped to logical address space. Assuming the application code does not change (this is a guideline), it can be presumed to be read-only. As such, only the needed portions of code are actually loaded into physical memory.

NOTE: This file mapping only applies to native applications. These applications have code stored in the data fork.

As a result of this file paging scheme, native applications have a special note attached to their Get Info boxes. At the bottom of Get Info window, there is a message indicating that if virtual memory is turned on, the application’s RAM requirements change.

The same application's memory requirement changes when Virtual Memory is turned on (which is indicated in the note). This change in memory requirements is made automatically by the system.

If virtual memory is not turned on, code is loaded into the application heap. The Finder and Process Manager will automatically expand the memory as necessary. This is similar to the 680x0 run-time environment.

Article Change History:
06 Mar 1995 - Added keyword; made multiple technical updates.
11 May 1994 - Changed Title to better reflect the article.
21 Mar 1994 - Made various corrections to the Fragment section.

Power Macintosh: New Control Panels (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: New Control Panels (3/94)

==========

Article Created: 10 March 1994

TOPIC ----------

This article describes the changes made to the Monitors and Memory Control Panels.

DISCUSSION ----------

The Monitor Control Panel has been modified so a change in the desktop (moving of the menu bar for example) takes affect either after restart or upon close of the control panel. This option is selected using the radio button located on the bottom left hand corner of the window.

With the new Memory Manager (called Modern Memory Manager), there is a modification to the Memory Control Panel. It is possible to disable this new Memory Manager and revert to the old Memory Manager in ROM for software compatibility. This is done through the Modern Memory Manager section in the Memory Control Panel. The default setting is using the new Memory Manager.

Article Created: 10 March 1994

TOPIC -----

This article describes sampling rate playback change.

DISCUSSION -----

The sampling rate of 22.05 kHz replaced the sampling rate of 22.254 kHz in older Macintosh models. This new rate was changed for compatibility with the 44.1 kHz audio CD sampling rate.

For sound samples made at the 22.254 kHz rate, playback at the 22.05 kHz results in a 1% change in pitch (lower).

Power Macintosh: Upgrade Card and Card Control Panel (3/94)

Revised: 3/11/94
Security: Everyone

Power Macintosh: Upgrade Card and Card Control Panel (3/94)

==========

Article Created: 10 March 1994

TOPIC --------------------

This article briefly describes the new Control Panel that comes with the Power Macintosh Upgrade Card.

DISCUSSION --------------------

Macintosh computers with a 68040 processor direct slot can be upgraded to a PowerPC processor via an expansion card. In order to support this card, a Power Macintosh bootable system folder is required. Within this system folder is a Power Macintosh specific system enabler and a new control panel.

The Power Macintosh Card Control Panel allows the user the option of selecting which processor to use. This selection is made via the Power Macintosh Card control panel. It is a simple off or on selection. The system has to be restarted for the new selection to take effect.

LaserWriter 8.x: Configuring Paper Trays (3/94)

Revised: 3/14/94
Security: Everyone

LaserWriter 8.x: Configuring Paper Trays (3/94)

==========

Article Created: 14 March 1994

TOPIC ----------

How can I configure the LaserWriter 8.x software so that it uses the 500 sheet tray?

DISCUSSION ----------

Once the LaserWriter 8.x software is installed, it needs to be configured.

1) Open the Chooser
2) Select the LaserWriter 8.x driver
3) Select your printer
4) Click "Setup"
5) Click "Configure". If you don't see the "Configure" button, Click the "More Options" button
6) Select your cassette preference:
   - Not Installed
   - Installed
   - Installed and Preferred

After configuring the print driver, those paper tray options appear in the Print dialog.

Memory Configurations: Portables & PowerBook (9/96)

Revised: 9/24/96
Security: Everyone

Memory Configurations: Portables & PowerBook (9/96)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 23 September 1996

TOPIC ----------

What are the memory configurations for the Portable and PowerBook computers?

DISCUSSION ----------

The following table includes the memory configurations for Portable and PowerBook computers.

For information about upgrading the memory in another Macintosh computer, use the search string "memory configurations" to locate the following articles:
"Memory Configurations: Power Macintosh (1 of 4)"
"Memory Configurations: Servers (2 of 4)"
"Memory Configurations: Other Desktop Macintosh (4 of 4)"

This article has two parts:

- A table of portable Macintosh computers' RAM Configurations.
- A series of notes, each with a number corresponding to a number in the table's "Notes" column.

Begin_Table

Portable Macintosh RAM Configurations

System	MB of RAM Soldered on Board	Number of Expansion Slots	Possible RAM Configs (MB)	RAM Speed	Notes
Portable*	1	1	1,2,3,4,5,6, 7,8,9	100ns	2,3,4
Portable*	1	1	1,2,3,4,5,6,	100ns	2,3,4

(backlit)			7,8		
PowerBook 100*	2	1	2,4,6,8	100ns	1,5
PowerBook 140*, 145*	2	1	2,4,6,8	100ns	1,6
PowerBook 145B*	4	1	4,6,8	100ns	1,7
PowerBook 150	4	1	4 to 40	70ns	1,10
PowerBook 160*	4	1	4,6,8,10,12,14	100ns	1,7
PowerBook 165*	4	1	4,6,8,10,12,14	85ns	1,7,8
PowerBook 165c*	4	1	4,6,8,10,12,14	85 or 100ns	1,7,8
PowerBook 170*	2	1	2,4,6,8	100ns	1,6
PowerBook 180*	4	1	4,6,8,10,12,14	85 or 100ns	1,7,8
PowerBook 180c*	4	1	4,6,8,10,12,14	85 or 100ns	1,7,8
PowerBook 520/520c	4	1	4 to 36	70ns	1
PowerBook 540*/540c	4	1	4 to 36	70ns	1
PowerBook Duo 210*	4	1	4 to 24	70ns	1,9
PowerBook Duo 230*,250*	4	1	4 to 24	70ns	1,9
PowerBook Duo 270c*	4	1	4 to 32	70ns	1,9
PowerBook Duo 280*/280c	4	1	4 to 40	70ns	1
PowerBook 190, 190cs	4 or 8	1	4 to 36 or 40	70ns	1,14

PowerBook 5300	8	1	8 to 64	70ns	1
PowerBook 5300c, 5300cs	8 or 16	1	4 to 64	70ns	1,11
PowerBook 5300ce	16	1	4 to 64	70ns	1,12
PowerBook 2300c	8	1	4 to 56	70ns	1,13

End_Table

Notes
=====

* Product no longer being produced by Apple.

1) These systems have 32-bit-clean ROMs. Computers with 32-bit-clean ROMs can take advantage of more than 8 MB of physical RAM under System 7 or higher.

2) The ROMs in these systems are not 32-bit-clean, but with the 32-Bit System Enabler under System 7.1 or MODE32 with versions of System 7 prior to 7.1, they can run in 32-bit mode and can take advantage of more than 8 MB of physical RAM.

3) The Macintosh Portable has 1 MB of RAM soldered to the main logic board. You can add more RAM using an expansion card. The Macintosh Portable memory expansion card can have from 1 MB to 4 MB of RAM. The backlit Macintosh Portable memory expansion card can have 1 MB to 3 MB of RAM.

4) If the processor-direct slot (PDS) is used for other peripherals, the maximum RAM is 5 MB for the Macintosh Portable and 4 MB for the backlit Macintosh Portable, using a memory expansion card.

5) The PowerBook 100 has 2 MB of pseudostatic RAM on the main logic board and one expansion slot. Additional RAM can be added using a RAM expansion card for a maximum of 8 MB.

6) The PowerBook 140, 145, and 170 have 2 MB of pseudostatic RAM on the main logic board and one expansion slot. The 4 MB configuration shipped from Apple has a 2 MB RAM expansion card installed. To expand up to 8 MB, replace the 2 MB RAM expansion card (if installed) with either a 4 MB or 6 MB RAM expansion card.

7) The PowerBook 145B, 160, 165c, 180 and 180c have 4 MB of pseudostatic RAM on the main logic board and one expansion slot. The 4 MB configuration shipped from Apple has no RAM expansion card installed. To expand up to 6 MB, 8 MB, or 14 MB, install a 2 MB RAM expansion card, 4 MB RAM expansion card, or 10 MB RAM expansion card, respectively (note

that the PowerBook 145B can be expanded to a maximum of 8 MB).

8) For the PowerBook 165, 165c, 180, and 180c, we suggest 85ns pseudostatic RAM. Use of 100ns pseudostatic RAM results in a performance decrease of approximately 5-10%.

9) The PowerBook Duo 210, Duo 230, Duo 250 and Duo 270c have 4 MB of low-power DRAM on the main logic board and one expansion slot. The 4 MB configuration shipped from Apple has no RAM expansion card installed, while the 12 MB configuration has a 8 MB expansion card installed. To expand your Duo, add the appropriate size memory expansion card.

10) The PowerBook 150 uses Duo type memory. However in order to add more RAM, you must first have a memory adapter installed. The part number for this adapter is M3179LL/A.

11) The PowerBook 5300cs and 5300c come with either 8 or 16 MB of RAM soldered on to the logic board. Either configuration is expandable to 64 MB of RAM.

12) The PowerBook 5300ce comes with a 16 MB expansion card installed.

13) The PowerBook 2300c has 8 MB of RAM on the main logic board and one expansion slot. The 8 MB configuration shipped from Apple has no RAM expansion card installed, while the 20 MB configuration has a 12 MB expansion card installed.

14) The PowerBook 190 and 190cs come with either 4 or 8 MB of RAM soldered on the main logic board and one expansion slot. The model that comes with 4 MB on the logic board is expandable to 36 MB. The model that comes with 8 MB on the logic board is expandable to 40 MB.

Article Change History:
23 Sep 1996 - Updated title and added blurb for related articles.
18 Oct 1995 - Removed irrelevant column from table.
12 Oct 1995 - Added new PowerBook computers to table.

Newton Connection Kit 2.0: Description (3/94)

Revised: 3/31/94
Security: Everyone

Newton Connection Kit 2.0: Description (3/94)

==========

Article Created: 8 March 1994
Article Reviewed/Updated: 31 March 1994

TOPIC -----

This article describes the Newton Connection Kit 2.0.

DISCUSSION -----

Newton Connection Kit 2.0 makes it simple for people to exchange Newton information with common Macintosh and Windows applications.

Newton Connection Kit 2.0 enables users to exchange and share their MessagePad information---notes, letters, name-cards, to-do lists, appointments, and even information created with many third party applications---with common desktop personal information management (PIM), word-processing, spreadsheet and database applications. It also enables users to access and edit MessagePad information easily using common desktop applications with which they may already be familiar.

Direct Export and Import from Macintosh applications

Newton Connection 2.0 enables people to import and export native files directly from many common supported Macintosh applications to Newton's address book, calendar and notepad, by incorporating portions of the award-winning MacLinkPlus file translation library, a product from DataViz Inc. (Trumbull, CT). Supported Macintosh applications include common titles such as: Portfolio Software's Dynodex; Symantec's Act!; Now Software's Now-Upto-Date; Aldus' DateBookPro; PowerUp's Addressbook Plus; Microsoft's Excel, Word and Works; Lotus 1-2-3; WordPerfect; Nisus; and WriteNow, among others.

Industry Standard Text Files

Newton Connection v 2.0 enables people to create, save and modify industry

standard tab-separated and comma-separated text files for exchanging (importing and exporting) Newton information with numerous PIM, database and spreadsheet applications, such as Aldus' TouchBase Pro, Claris Corporation's FileMaker Pro and Hypercard Address Stacks, among others. For example, a list of names, addresses and phone numbers stored in Claris' Filemaker Pro can easily be imported into the MessagePad address book.

Newton Connection File Format

Newton Connection has a rich intermediate text file format which supports all Newton information, enabling cooperating desktop applications to synchronize, as well as exchange information with a Newton MessagePad. Many desktop application developers are already working with Apple to support this format directly within their applications.

System Requirements

Newton Connection Kit 2.0 for Macintosh requires 2000K of RAM, but preferably 2500K, System 7 or later, Apple SuperDrive, and at least a 68030 processor. The Windows version requires at least a 386SX with 4MB RAM and Windows 3.1 or later.

Compatibility

Backup files created with Newton Connection Kit 1.0 are not compatible with version 2.0. Customers are advised to backup with version 1.0, then with version 2.0 before erasing any backup files.

Special Software Offer

In a limited special offer, the Newton Connection kit for both Windows and Macintosh will include several sample Starcore Newton applications, while supplies of these samples last: Columbo's Mystery Capers, Silicon Casino, GoFigure, Fortune 500 Guide To American Business and Dell Crossword Puzzles and Other Word Games (demo versions). In addition, Newton Book--an electronic book containing descriptions of numerous Newton commercial and shareware applications--will be included in the special offer, as will the Newton DataViewer, which enables the import and export of spreadsheet data. The Newton DataViewer allows people to manipulate spreadsheet data from their desktop on their Newton MessagePad by scrolling horizontally and vertically, sorting by column, and exporting back to the desktop spreadsheet.

Free Upgrades

Apple will send all registered purchasers of Newton Connection v 1.00 a free upgrade to Newton Connection v 2.0. Customers who received a complimentary preview version of the Newton Connection Kit at MacWorld Expo in Boston in August 1993 will also be receiving a free upgrade to Newton Connection v 2.0.

Registered users may expect to receive their upgrades in the latter part of March. The Windows version should arrive approximately eight to ten weeks after the Macintosh version ships. If you do not receive the upgrade, call the Newton Fullfillment Center at 1-800-242-3374.

Article Change History:
31 March 1994 - Added additional system requirements for Macintosh connection.

Quadra 700: Power Macintosh PDS Upgrade Blocks NuBus Slot (3/94)

Revised: 3/10/94
Security: Everyone

Quadra 700: Power Macintosh PDS Upgrade Blocks NuBus Slot (3/94)

==========

Article Created: 10 March 1994

TOPIC --------------------

If I install the Power Macintosh PDS Upgrade Card in my Quadra 700, can I still use both NuBus slots?

DISCUSSION --------------------

No, the $E NuBus slot (the one closest to the outside case) must be empty in order to install the Power Macintosh PDS Upgrade Card. The PDS and NuBus slots are in line with each other in the Quadra 700, you can install either a PDS card or a NuBus card but not one of each.

Power Macintosh: SimpleText, Extras Folder, System 7.1.2 (1/95)

Revised: 1/19/95
Security: Everyone

Power Macintosh: SimpleText, Extras Folder, System 7.1.2 (1/95)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 09 January 1995

TOPIC

This article describes the new SimpleText application and the contents of the Extras Folder that come with System 7.1.2 on the original Power Macintosh 6100, Power Macintosh 7100 and Power Macintosh 8100.

DISCUSSION

The three Power Macintosh systems initially were loaded with System 7.1.2. This release of system software was modified to support the PowerPC processor. In addition, the following items were included with System 7.1.2:

SimpleText

TeachText has been updated. This new version is called SimpleText. It allows the selection of different fonts, font sizes and styles. It also supports sound. A SimpleText document can store a single digital recording. In addition, there are menu selections which support PlainTalk of the text.

Extras Folder

In addition to the PowerPC system changes the following items are bundled with the system and installed in an Extras folder:

- AppleScript 1.1 extension including Script Editor application, sample scripts and "Getting Started With AppleScript" in DocViewer format.

- CPU Energy Saver (for Power Macintosh 7100/66, 7100/66AV, 8100/80, and 8100/80AV computers): The computer can be set to turn on or off automatically, using the CPU Energy Saver control panel.

  IMPORTANT: CPU Energy Saver does not work on Power Macintosh 6100/60 or 6100/60AV computers.

- Energy Saver (for monitors): This control panel allows the monitor to go into low power mode after the computer has been idle for a specified amount of time.

  The Energy Saver can be used in the following situations:
  - A Power Macintosh computer (or a Macintosh Quadra, Centris, or LC III computers)
  - 2 MB of available RAM
  - System Software version 7.1
  - An Apple monitor that complies with the United States Environmental Protection Agency's Energy Star guidelines for energy conservation (the monitor must be plugged into the built-in monitor port, not into an expansion card)

- FusionRecorder: This audio and video capture program records and plays high-quality sound and, if you have an AV-equipped Power Macintosh, QuickTime video movies.

- LaserWriter 8.1.1: The LaserWriter 8.1.1 driver is installed in the Extras folder. The System folder has the LaserWriter 7.1.2 driver installed.

- Graphing Calculator: This program demonstrates your Power Macintosh computer's speed, and shows how speed can improve a Macintosh application program's performance. For more information about this program, start the program and select Help from the Equation menu. A self-running demonstration program can be viewed by selecting Full Demo from the Demo menu.

- Video Monitor: The Video Monitor program allows the computer to display a live video image in a window on the screen and to capture one frame of the video image. A Power Macintosh 6100/60AV, 7100/66AV, or 8100/80AV computer is required. In addition video equipment must be connected to your computer's video ports.

- DocViewer: To view the AppleScript Guide or the FusionRecorder Read Me file, a program called DocViewer is required. DocViewer displays files for you to read on the screen. It can be used to search for specific topics in files, and print out pages of information. The DocViewer Read Me file explains how to use DocViewer.

Article Change History:
09 Jan 1995 - Noted that 7.1.2 was installed on the early Power Macintosh computers.

At Ease 2.0: Problems with Color Selection Dialog (8/95)

Revised: 8/9/95
Security: Everyone

At Ease 2.0: Problems with Color Selection Dialog (8/95)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 9 August 1995

TOPIC ----------

When I hold down the Option key to select the number of colors an application can use when launching, I can't choose the down arrow to display more choices.

DISCUSSION ----------

This is actually a problem with At Ease 2.0 in both Workgroups and the Non-Workgroups version when setting monitor bit depth.

There are two issues:

• The options will include "thousands" and "millions of colors" and other choices, whether your video card supports it or not.

• The 'hot spot' on the pull down selection is mapped to the wrong spot. Clicking and holding on the actual name (to the left of the triangle) will display all the available options for color choices. You can then set the color selection for that particular application.

Article Change History:
09 Aug 1995 - Added keyword and reviewed for accuracy.
26 May 1994 - Added info that gives you options your system may not support.

CD Sampler.BW Gives an Error in HyperCard (3/94)

Revised: 3/11/94
Security: Everyone

CD Sampler.BW Gives an Error in HyperCard (3/94)

==========

Article Created: 10 March 1994

TOPIC ----------

The CD Sampler.BW on Apple's CD-ROM Titles Sampler give error T63 when attempting to run demos. The CD Sampler.Color works fine.

To duplicate: Open the CD Sampler.BW stack, click on Topics. Click on Entertainment. Click on Baseballs Greatest Hits. Click on "Run Demo." Error T63 occurs. Also occurs for other demos.

DISCUSSION ----------

Opening the stack with the complete version of HyperCard 2.2 instead of the Player will generate a different error. At the point where the t63 error had appeared, the error "Don't understand "colorizeHC" now appears. The colorHC reference is to a series of XCMDs that add color to the HyperCard interface.

This XCMD has been used with the Sampler stacks. There appears to be a problem with properly handling the color depth when using these XCMDs. This should be handled more gracefully than it is.

Unfortunately, there is no workaround for this problem. Since the stack is a protected stack, there is no way to workaround the presentation of the error messages.

A/UX: Can't Connect to the Toolbox, Can't Launch Macgetty (3/94)

Revised: 3/29/94
Security: Everyone

A/UX: Can't Connect to the Toolbox, Can't Launch Macgetty (3/94)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 29 March 1994

TOPIC ----------

I'm getting the error on the A/UX console stating:
"Can't Connect to the ToolBox environment - Can't launch macgetty-Launching getty instead." Then the startup fails.

DISCUSSION ----------

Here are some trouble-shooting steps you should try if you are getting this error:

1) ls -l /etc/macgetty should give you
   -rwxr-x--- root sys (for the permissions, owner, and group)
   if they aren't set that way
   chmod 750 /etc/macgetty will change the permissions
   chown root /etc/macgetty will change the ownership
   chgrp sys /etc/macgetty will change the group

2) If you notice in step 1. above that both owner and group are set to root, issue the command:
   ls -l /etc

If you notice that every file is set with root ownership and root groupship, it is probably time to reinstall the core A/UX.
The only way to tell how many files and directories are messed up is to mount the installation cd and check all the files.
This is often the vestige of someone having changed permissions on a folder from the file menu's "UNIX permissions ..." choice and having checked the "make all currently enclosed ..." option.

3) If the file permissions seem to be set correctly, try the command:
   su sys

If that fails with an error like "can't execute /bin/sh",
issue the commands:

cd /
ls -la
make sure that the entries for "/etc" and ".." (which is "/" itself)
are set to:
drwxrwxr-x   bin sys   for /etc
drwxr-xr-x   root root   for ..
as long as they are listed as "d" for directory chmod 775 /etc ;
chown bin /etc; chgrp sys /etc will fix "/etc"
and
chmod 755 /; chown root /; chgrp root /
will fix "/"

4) If the permissions seem OK on the files and directories, and the error specifically refers to the ToolBox, then the solution may be to replace the /mac/lib/Patches/Patch* files from the CD or from a working A/UX machine running the same version of A/UX (open a command shell and type uname -a to find A/UX version number). The easiest way to get these files would be to ftp them over from another machine.

Filenames are: Patch.0178 & Patch.067C

To get them from the CD-ROM, you must mount the CD as a Unix Filesystem using the mount command:

mount -o r /dev/dsk/c10xdos0 /mnt where the 'x' indicates the SCSI id of the CD ROM drive, and the 'c1' on an Apple WorkGroup Server 95 could be c1-4, depending to which SCSI bus the CD-ROM drive is attached. Once mounted, you can copy the files using the cp command:

cp /mnt/mac/lib/Patches/Patch* /mac/lib/Patches/*

5) If none of the above troubleshooting tips help, then a complete reinstall of core A/UX is most likely in order. Remember to backup any system specific files (such as hosts, or NETADDRS, Users and Groups datafile, etc.) whenever doing a reinstall.

Article Change History:
29 Mar 1994 - Added trouble-shooting tips for problem. Combined can't launch toolbox and Macgetty into one. Added reinstall as final option.

MacTCP: Invalid Address (3/94)

==========

Article Created: 10 Mar 1994

TOPIC --------------------

Every time I manually enter an address in the MacTCP control panel, and then close the Control Panel, I get an error that the address is invalid.

DISCUSSION --------------------

First verify with your network administrator that the address you are using is indeed a valid address, and that there are no duplicate addresses on your network.

If your address is valid, make sure when you enter the address that no additional characters are accidentally added. Characters such as <Return> and <Ctrl> accidentally added after entering the address can cause this error.

A/UX: mail and not a typewriter (2/95)

Revised: 2/27/95
Security: Everyone

A/UX: mail and "not a typewriter" (2/95)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 27 February 1995

TOPIC ----------

What does "not a typewriter" mean when sending mail in A/UX?

DISCUSSION ----------

The "user unknown: not a typewriter" error message is most likely caused by the sendmail program mapping the user's name to lowercase before checking /etc/password for the user's account. For example, a username of Mike or Jim would be mapped to 'mike' or 'jim', and then the passwd file is checked for those names. This is the way login names are supposed to appear in the passwd file.

The solution would be to create a username in the passwd file all in lowercase. "Jim" would have an entry of "jim" as well.

The error saying "not a typewriter" is a historical error. The text for this error message was created when the terminals attached to the system were teletypes. The error is saying that there is no terminal attached to the process where the process can send messages generated by either STDIO (standard output) or STDERR (standard error). This message is common on processes that are started from a script, from cron, or from inittab. It can also be encountered if a process is started as a background process. If the process generates any kind of output, the message "not a typewriter" is displayed.

Article Change History:
27 Feb 1995 - Added historic information on "not a typewriter".

Macintosh AV: Noise With Sampled Audio (3/94)

Revised: 3/23/94
Security: Everyone

Macintosh AV: Noise With Sampled Audio (3/94)

==========

Article Created: 11 March 1994
Article Reviewed/Updated: 23 March 1994

TOPIC ----------

Customers are complaining about hiss and popping within a recorded audio sample. They are sampling from their internal CD-ROM drive using the CD-Remote DA with Fusion Recorder or MacroMedia's SoundEdit Pro v1.0.5.

• Configuration:
  Macintosh Quadra 840AV 8/230/Int.CD 300i & External CD 150
  System Software: Clean Installed 7.1 from CD;
  Express Modem Software;
  Virtual Memory: OFF
  File Sharing: OFF
  Express Modem: OFF
  Sound Out: 44 kHz; 16 Bit & Stereo
  Sound In: Internal CD & Playthrough selected
  **For Internal Sampling Sound In: External Audio & Playthrough selected

  **For External Sampling:

1) Sampling a sound via the internal CD 300i OR external audio source using both SoundEdit Pro v1.0.5 and Fusion Recorder v1.0.1 and the Apple CD Remote DA produces a poor quality sound with "hiss", "popping" and hesitation or skipping through both the internal speaker and external headphones.

NOTE: With Fusion Recorder we also heard a high pitched tone at random times of a sampled sound. During the recording of the audio, the sound is perfect while playing through internal speaker or head phones.

2) Sampling a sound via the internal CD 300i using the Apple ATG Group's Zounds(1/20/93) application products a clean and acceptable sound (AIFF format) on playback. Appears to just dump the sound right to the hard drive during recording in a "ZoundsTemp1", "ZoundsTemp2", etc. file.

3) Converting audio track via the internal CD 300i using Fusion Recorder v1.0.1 and QuickTime 1.6.1 produces a clean and acceptable sound (MooV format) on playback.

The questions raised are:

- Can the Sound Manager be interfering in our samplings?
- Is there a setting that we have overlooked to eliminate the additional sound introduced in the sampling?

DISCUSSION ----------

There are several issues to be considered here. First, the firmware present in most CD300 drives has difficulty correctly transferring digital audio. The problem has been corrected in the newer CD300 Plus drives.

Second, there is a basic throughput issue. In order to correctly read digital audio data, you need to read a chunk of audio, byte swap it, write it to disk, and issue another read command to the CD ROM drive before the drive overruns its read buffer. If you try this on a Macintosh with synchronous read and write calls, it is impossible to do.

There are a few things which the user can do to get the best performance from the Macintosh AV machines:

- Disable File Sharing. File sharing slows down overall system performance. For best results, disable file sharing before using digital audio software. Use the "Sharing Setup" control panel to disable file sharing.

- Unmount File Servers. For the reason mentioned above, unmount any network file servers before using digital audio software.

- Turn off Virtual Memory. Virtual Memory (VM) allows you to use part of your hard disk as if is was RAM. In general, sound editing applications do not work well with VM enabled. Use the Memory control panel to turn off VM and reboot your Macintosh.

- Turn off Speech Recognition. Apple's Speech Recognition software on the 660 and 840AV uses the DSP (Digital Signal Processor) to do its processing. Digital audio software requires nearly 100% of the DSP to perform its operations. Use the Speech setup control panel to disable Speech Recognition.

- Turn off the Express Modem. Apple's Express Modem software also makes heavy use of the DSP. Use the Express Modem control panel to turn off the Express Modem before using digital audio software.

- "Run Lean". Disable any unnecessary Extensions and Control Panels in the System Folder. Many Extensions and Control Panels use up some of the processing power of your Macintosh. To get the best performance from digital audio software, disable any unnecessary Extensions and Control Panels.

- Use High Speed Hard Disks. High Speed internal or external hard disks with SCSI-2 interfaces will work best for recording digital audio. You should also look for disks that don't use thermal recalibration or do it in the background when you are not recording audio.

- Optimize Your Hard Disk. Recording digital audio places a large burden on your hard disk. For best results use a hard disk optimizing program such as Speed Disk which is included in the Norton Utilities or the FWB Toolkit from FWB Software.

Power Macintosh: SNA•ps Is Compatible (5/94)

==========

Article Created: 14 March 1994
Article Reviewed/Updated: 26 May 1994

TOPIC ----------

The following compatibility information was provided by Wall Data, Inc. and describes compatibility of the SNA•ps product line with Power Macintosh.

DISCUSSION ----------

The SNA•ps product line is compatible with Power Macintosh computers running in emulation mode.

Details of SNA•ps Compatibility

The entire SNA•ps product line was tested with prototypes of the Power Macintosh. SNA•ps 3270 Gateway Client (GC) (v1.1.3), SNA•ps 5250 GC (v1.2) and SNA•ps Print (v1.2) were all found to be compatible running in the emulation mode. The SNA•ps Gateway (v2.0.1) configuration and administration applications were also compatible. The SNA•ps Gateway code extension loaded correctly and did get downloaded to the various NuBus cards (4/16 Token Ring, Serial NB, and Coax). Be sure to use A/ROSE 1.2.1 with Macintosh Coprocessor Platform (MCP) NuBus cards (4/16 Token Ring and Serial NB) in Power Macintosh computers; it is expected that all gateways will operate in a stable fashion on released Power Macintosh hardware and system software. Below is a list of SNA•ps software versions which are compatible with Power Macintosh, however be sure that the Power Macintosh Modern Memory Manager is ON before attempting to launch any SNA•ps software:

SNA•ps 3270	V 1.1.2 or later
SNA•ps 3270 GC	V 1.1.2 or later
SNA•ps 5250	V 1.0 or later
SNA•ps 5250 GC	V 1.0 or later
SNA•ps Print	V 1.0 or later
SNA•ps Gateway/10	V 2.0 or later
SNA•ps Gateway/35	V 2.0 or later

SNA•ps Gateway/70 V 2.0 or later

Also, there seem to be some system extension and Control Panel device conflicts between SNA•ps and other third-party software running in emulation mode on a Power Macintosh. The known incompatible software with SNA•ps is NOW Up-to-Date and Norton Utilities Disk Light, and there may be others. If problems are encountered while attempting to boot a Power Macintosh or launch SNA•ps software, it is recommend the user remove all other third-party system extensions and Control Panel devices from the System Folder. The Power Macintosh should boot and SNA•ps should then run OK. Then go through a process of elimination to determine which third-party system extension or Control Panel device is conflicting with SNA•ps.

Native Power Macintosh Version

As of March 1994, there is no delivery date for native versions of the SNA•ps product line.

Upgrade Distribution

The Wall Data upgrade program for SNA•ps is expected to start June 13, 1994. Wall Data will manage upgrades through a FAX program using a Wall Data SNA•ps Registration form. The customer must complete the form, and FAX it to Wall Data at the California FAX number to get the upgrade. All upgrades are priced but most are offered at 100% discount until August 31, 1994. There will always be a charge for SNA•ps 5250 upgrades. The Registration form calls for details about proof of purchase and how to pay for any upgrades. To get an Registration form FAXed to you, call Wall Data's Inside Sales group or the regular 408 area code number. Customers can also mail forms to Wall Data's California address.

To locate a vendor's address and phone number, use the vendor name as a search string.

The versions of SNA•ps software offered by Wall Data is NOT native Power Macintosh software, and you may experience the same problems with Modern Memory Manager and/or third-party extension conflicts. Available from Wall Data are the following versions of SNA•ps:

SNA•ps 3270	V 1.1.3
SNA•ps 3270 GC	V 1.1.3
SNA•ps 5250	V 1.2
SNA•ps 5250 GC	V 1.2
SNA•ps Print	V 1.2
SNA•ps Gateway/10	V 2.0.1
SNA•ps Gateway/35	V 2.0.1
SNA•ps Gateway/70	V 2.0.1

Power Macintosh: Both Serial Ports Support GeoPort (3/94)

==========

Article Created: 10 March 1994

TOPIC -----

Does it matter if I use the printer serial port, or modem serial port on a Power Macintosh when making a GeoPort connection?

DISCUSSION -----

No. Both serial ports support the GeoPort protocols, and they utilize a 9-pin mini-DIN connector.

Apple, DayStar PowerPC Upgrade Cards Compared (3/94)

==========

Article Created: 11 March 1994

TOPIC ----------

This article compares the Apple PowerPC Upgrade Card with the DayStar PowerPro 601 PowerPC Upgrade Cards

DISCUSSION ----------

Feature:	Apple PowerPC Upgrade Card	DayStar PowerPro 601
RISC processor	PowerPC 601	PowerPC 601
Processor Speed(s)	66 MHz	66 MHz, 80 MHz*
Restart with 68040	No	Yes
Maximum Operating Speed:		
- Centris 650	50 MHz	80 MHz
- Quadra 700, 900	50 MHz	80 MHz
- Quadra 650, 800, 950	50 MHz	80 MHz
Memory Expansion (on the card)	0 MB	128 MB
Maximum System Memory		
- Quadra 700	68 MB	196 MB
- Centris 650	136 MB	264 MB
- Quadra 650, 800	136 MB	264 MB
- Quadra 900, 950	256 MB	384 MB
Cache size available	1 MB	1 MB
Direct access to 64-bit memory	No	Yes

* The DayStar PowerPro 601 comes in two versions: one with a 601 chip running at 66 MHz and the second with a 601 chip running at 80 MHz.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Calculator: Divide by 0 gives Infinity (3/94)

Revised: 3/11/94
Security: Everyone

Calculator: Divide by 0 gives Infinity (3/94)

==========

Article Created: 11 Mar 1994

TOPIC -----

When I divide the number 1 by the number 0, using the Calculator DA, I get the answer ‘infinity.’ Why does the calculator give me this answer?

DISCUSSION -----

Any number divided by “nothing,” or “zero” is undefined.

You can take the limit of 1/n as n->0 and you’ll see that as ”n” is in the whole number domain and decreases from +∞ toward 1, and that the result approaches “1.” As “n” decreases from 1 toward 0 (.9,.8,.7,...,.0000003, ...,.00000000002, etc.) the result gets larger (for example: 1/.2 = 5, 1/.02 = 50, 1/.002 = 500, etc.). As the “n” gets smaller, the result gets larger. As “n” approaches 0, the result approaches +∞.

In Calculus, lim (1/n) as n->0 => +∞ which is undefined, so either “infinity” (∞) or “undefined” is the correct answer.

Macintosh Displays: Overview of Sense Codes and Adapters (5/95)

Revised: 5/5/95
Security: Everyone

Macintosh Displays: Overview of Sense Codes and Adapters (5/95)

==========

Article Created: 10 March 1994
Article Reviewed/Updated: 5 May 1995

TOPIC ----------

This article describes sense codes and sense adapters and why they are used.

DISCUSSION ----------

Apple computers and video cards rely on sense codes in the display's video cable to determine what resolution at which to run. For example, an Apple 13-inch RGB monitor tells the Macintosh that it supports 640x480, so the Macintosh computer responds by displaying that resolution. When an Apple Multiple Scan Display is connected, it signals to the Macintosh that it can run in a range of resolutions. For example, a Multiple Scan 20 Display can support resolutions from 640x480 up to 1152x870. Sense Code technology is how Apple displays know what resolution to display.

Older Macintosh computers and Apple video cards do not have reprogramable video drivers that allow them to switch to higher resolutions. If a Multiple Scan Display is connected to an older Macintosh or video card, it will be limited to 640x480 resolution.

Macintosh computers and video cards that fall into this class are:

Video Cards - 4•8, 8•24, and 8•24GC
LC , LC II, LC III (except 475, 476, and 630)
Performa (except the 475, 476, and 630 family)
PowerBook
Duo Dock and MiniDock*
Macintosh II family

The sense adapter attaches to the display's video cable, and has a sense code for a higher resolution.

* - The Duo Dock does not require a video adapter to change resolutions when

System 7.5 is installed.

Sense Adapters

Sense code cable adapters allow older Macintosh and video cards to display higher resolutions on multiple scan displays. The adapters have a sense code for a higher resolution. This tricks the Macintosh into thinking it is hooked to a fixed frequency display like our 16-inch and 21-inch RGB displays.

The other solution when using a multiple scan display, is to use a programmable display card like a Macintosh Display Card 24AC. Because this card is fully capable of recognizing the multiple scan sense codes and changing resolutions without restarting, even older Macintosh Systems work fine if they have a 24ac card.

Sense Code Adapter Specifications

832x624 Adapter - 16-inch Display

4•8, 8•24, 8•24GC	Yes	Yes	

Notes:
1) No built-in video. Video is limited only by the video card used.
2) Limited to a resolution of 640x480 with built-in video.
3) Limited to a resolution of 832x624.
4) The Duo Dock does not require a video adapter to change resolutions when System 7.5 is installed.

End_Table

Display Adapters

The Apple Multiple Scan 20 Display has several resolutions. Macintosh computers designed before the introduction of Apple Multiple Scan 20 Display will only recognize the display as a 14-in color display without an adapter. The adapters, available through Apple Resellers and third party companies, contain a sense code that tells the Macintosh that the display is fixed frequency 16-in. or 21-in. display. Without the adapter, the display will be fixed at a 640x480 resolution.

Display adapters are available from several third-pary companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Article Change History:
08 Feb 1996 - Added additional adapter information.
16 Nov 1995 - Removed part numbers for cable adapters.
20 Apr 1995 - Added information on System 7.5 and Duo Dock.

Macintosh LC 500 Series: Flashing ? At Startup (3/94)

Revised: 3/14/94
Security: Everyone

Macintosh LC 500 Series: Flashing "?" At Startup (3/94)

==========

Article Created: 14 March 1994

TOPIC -----

Upon startup, my Macintosh LC 5xx shows a flashing question mark on the screen. When I insert my Install Me First CD and restart the computer, it still refuses to boot up.

Trying to force it to startup from the CD by pressing the Command, Option, Shift, and Delete key combination to bypass the hard drive doesn’t allow the system to boot either. What could be wrong?

DISCUSSION -----

Resetting the PRAM (Parameter RAM) by holding down the Command, Option, P, and R key combination at startup can fix this problem. If it will boot from the CD but not the hard drive, proceed with a clean reinstallation of the system software.

** NOTE: When trying to do keyboard commands before start up make, sure the CAPS LOCK key is not depressed.

Apple Personal Diagnostics:Emergency Disk Fulfillment (5/96)

Revised: 5/24/96
Security: Everyone

Apple Personal Diagnostics:Emergency Disk Fulfillment (5/96)

==========

Article Created: 14 March 1994
Article Reviewed/Updated: 24 May 1996

TOPIC ----------

The emergency disks that come with Apple Personal Diagnostics v 1.0 (APD) do not cover my Macintosh, what do I use?

DISCUSSION ----------

If you use APD Version 1.0 on one of the system configurations listed below, you may encounter a situation that requires an emergency disk not included in the APD package. Please call Apple Order Center and request that the appropriate disk be mailed to you.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

System Configurations Affected

The emergency disk called "APD Emergency Disk 3 - Miscellaneous Macintoshes" supports these systems:

- Macintosh Quadra 610, 650, 660AV, 800, 840AV
- Centris 610, 650, 660AV
- Macintosh TV
- Apple Workgroup Server 60, 80

The emergency disk called "APD Emergency Disk 4 - 800K Drives Only" supports any Macintosh CPU that does NOT have a 1.44 MB floppy drive.

Version 1.1 of Apple Personal Diagnostics comes with emergency disks that cover all Macintosh models except the Workgroup Server 9150.

Article Change History:

24 May 1996 - Updated for technical accuracy.
21 Feb 1995 - Added keyword; made minor technical updates.
05 Jan 1995 - Added information on version 1.1.

Apple Personal Diagnostics: Low Memory Alerts (3/94)

Revised: 3/14/94
Security: Everyone

Apple Personal Diagnostics: Low Memory Alerts (3/94)

==========

Article Created: 14 March 1994

TOPIC ----------

This article deals with the issue of low memory and Apple Personal Diagnostics.

DISCUSSION ----------

Apple Personal Diagnostics returns a low-memory alert when the APD application does not have enough memory to run or is running low on memory. For example, if you've created a report that requires more memory than is currently available. To allocate more memory to the APD application, you can do one or more of the following:

If you are using System 7, or System 6 with MultiFinder:

- Quit other applications that may be running at the same time as APD
- If you have sufficient RAM installed in your system, quit the APD application, open the Apple Personal Diagnostics Get Info box and increase the "preferred" application memory size to 1500K. (The application memory size is initially set to 1200K.)
- Close any open report.
- Reduce the size of any installed RAM disk and the system RAM cache.

If you are using System 6 with Finder rather than MultiFinder:

- Close any open report.
- Reduce the size of any installed RAM disk and the system Disk cache.

Chinese Language Kit: Description (2/95)

==========

Article Created: 18 October 1993
Article Revised/Updated: 15 February 1995

TOPIC --------------------

This article describes the features of the Chinese Language Kit, and gives the technical specifications.

DISCUSSION --------------------

Solutions

• Create documents and presentations in both Chinese and English, or Chinese and other languages supported by your system.
• Produce promotional materials, foreign-language textbooks, bilingual educational materials, and more.
• Insert Chinese text into letters, presentations, spreadsheets, and other documents.
• Boost language learning by using interactive practice drills and other learning tools.

Ease of Use

• Fast, simple installation.
• Enables you to easily create, edit, and print Chinese.
• Comes with an input guide which includes instructions in Chinese and English.

Compatibility

• Runs applications that have been localized, including WordPerfect or Nisus, or localized applications such as ClarisWorks Chinese, and TurboWriter.
• Recommended for all QuickDraw printers; also works with Postscript-compatible printers.

Flexibility

- Comes with TrueType fonts: LiSung for traditional and Song for simplified.
- Provides four additional fonts on the compact disk.
- Allows you to use simplified Chinese characters, traditional characters, or both.
- Provides a choice of input methods: Pinyin, Zhuyin, Cangjie, and others.

The Apple Chinese Language Kit contains everything you need to easily add Chinese text in your letters, presentations and reports.

Whether you're a desktop publisher or business professional, you can use the Language Kit to develop Chinese-language materials such as brochures, posters, business cards, presentations, and restaurant menus. Students and teachers can use it to run interactive Chinese-language programs and produce compelling term papers in Chinese. Although the Chinese Language Kit does not translate text, it does let you easily input, edit, and print in Chinese.

The Chinese Language Kit works as an extension to System 7.1 (or higher) and allows you to run Chinese applications. Because the Language Kit uses the operating system you already have, there's no need to store an additional system on your hard disk. The Chinese Language Kit also contains simplified and traditional characters, as well as a wide choice of input methods.

Many major software programs have a version that has been localized for use in Chinese-speaking countries. All you need to run them is the Chinese Language Kit and System 7.1 (or higher). You can even use non-localized programs, such as Nisus 3.4, that take advantage of WorldScript. WorldScript, introduced with System 7.1, simplifies the way in which a single operating system can support multiple languages.

The Chinese Language Kit comes with several TrueType fonts, which produce high-quality output from any Macintosh-compatible printer. Documentation is provided in both Chinese and English, making the Language Kit easy to use, whether you're a native speaker or just learning Chinese.

Technical Specifications

- Compatible applications

You can use the Chinese Language Kit with a variety of Chinese-localized applications. They include:

Canvas 3.5 Chinese, from Deneba
ClarisWorks 1.0 Chinese (Simplified) from Claris
ClarisWorks 1.0 Chinese (Traditional) from Claris
FileMaker Pro 1.0 Chinese (Traditional) from Claris
Imprint 1.35 Chinese, from Ivy Systems
Lotus 1-2-3 1.0 Chinese (Simplified) from Lotus
Lotus 1-2-3 1.0 Chinese (Traditional) from Lotus
NewsMaker Chinese, from Compose
Nisus 3.50 Chinese (Simplified) from Nisus
Nisus 3.50 Chinese (Traditional) from Nisus
PageMaker 3.0 Chinese (Simplified) from Aldus

PageMaker 3.5 Chinese (Traditional) from Aldus
TurboWriter 2.0.5 Chinese (Traditional) from Transpac
WordPerfect 2.2 Chinese (Simplified) from WordPerfect

• You can use the Chinese Language Kit with many non-localized programs that employ Apple WorldScript software technology.

These programs include:

AllPage 1.82, from MicroMacro
AllScript 1.81, from MicroMacro
FreeHand 3.1 Asian, from Aldus
Imprint 3.5, from Ivy Systems
In Control 2.0, from Attain
Nisus 3.482, from Nisus
Persuasion 2.1 Asian, from Aldus
Sindex 2.0, from WinSoft
StatView 4.01, from Abacus Concepts
WinFile 1.7, from WinSoft
WinText 2.7.1, from WinSoft
WinView 1.7, from WinSoft
WordPerfect 2.1.4, from WordPerfect

Note:
Apple has tested only a limited number of applications; these lists aren't intended to be comprehensive. Many non-localized applications that don't employ WorldScript software technology may provide limited functionality and allow input of Chinese characters.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Supported Fonts

The Chinese Language Kit contains several fonts, some automatically installed and some manually installed.

These CD-ROM based fonts are automatically installed with Traditional Chinese:

• Taipei (Bitmap font)
• Apple LiSung Light (TrueType font)

These CD-ROM based fonts are automatically installed with Simplified Chinese:

• Beijing (Bitmap font)
• Song (TrueType font)

These CD-ROM based fonts can be manually installed by putting them in your Fonts folder (found inside your System Folder):

• Apple LiGothic Medium (TrueType font for Traditional Chinese)
• Fang Song (TrueType font for Simplified Chinese)

• Hei (TrueType font for Simplified Chinese)
• Kai (TrueType font for Simplified Chinese)

Printers supported

Recommended: QuickDraw printers, including the Apple StyleWriter line, the Apple Personal LaserWriter, and the ImageWriter line. PostScript-compatible printers, including Personal LaserWriter NTR printers and other LaserWriter printers. (Although PostScript printers can produce Chinese, performance may vary.)

System requirements

• Apple Macintosh computer with at least 4 MB of RAM (5 MB recommended for multiple applications)
• Hard disk with at least 10 MB of space available (17 MB for both Simplified and Traditional Characters)
• Apple SuperDrive floppy disk drive
• Apple Macintosh System 7.1 or later (Updater required for System 7.5)
• An application that is Chinese-localized or that uses WorldScript software technology
• CD-ROM drive to use additional Chinese fonts

Kit Components

The Chinese Language Kit includes:

• Chinese Language Kit on thirteen 1.4 MB floppy disks
• WorldScript II system extension
• Chinese Language Kit Installation and User's Guide
• Macintosh Chinese Input Method Guide (simplified)
• Macintosh Chinese Input Method Guide (traditional)
• CD-ROM with additional fonts

Ordering Information

In the USA, order number M2368LL/A
Outside the USA, order number M2368Z/A

Article Change History:
15 Feb 1995 - Updated to include info on System 7.5.
26 Jan 1994 - Added ordering info and updated list of Chinese localized applications.
19 Jan 1994 - Added a list of supported fonts.

Newton Connection Kit: Syncing After PowerBook Sleeps (3/94)

Revised: 3/14/94
Security: Everyone

Newton Connection Kit: Syncing After PowerBook Sleeps (3/94)

==========

Article Created: 14 March 1994

TOPIC -----

When using the Newton Connection Kit and a PowerBook through AppleTalk, I have to reboot the Newton Connection for Macintosh to synchronize the units again after the PowerBook goes into the sleep mode. Why?

DISCUSSION -----

This is the expected behavior if any PowerBook is set up to "synchronize automatically" using AppleTalk. The Newton Connection for Macintosh does not know to revive the AppleTalk connection.

What happens is comparable to a file server connection between a PowerBook and an AppleShare server when the PowerBook goes to sleep and is awakened. The AppleTalk connection between the machines is broken when the PowerBook goes to sleep. After the PowerBook wakes up, the connection is still broken unless the control panel AutoRemounter is installed and remounts the server. With the Newton Connection for Macintosh, when configured to synchronize automatically, AppleTalk is being utilized to broadcast the PowerBook's name continuously on the network. When the PowerBook goes to sleep, the broadcasting stops because AppleTalk is shut down. When the computer is awakened, the Newton Connection application does not resume the broadcasting because it is unaware that AppleTalk has started up again.

Workarounds

- Go to preferences, deselect "synchronize automatically", click OK, go to preferences again, and select "synchronize automatically." This causes the software to check for AppleTalk again and start up broadcasting.

- Quit the Macintosh Connection Kit and restart. This causes the software to check AppleTalk and start broadcasting.

- Do not use "synchronize automatically". Then AppleTalk broadcasting only happens when the synchronize button on the Macintosh Connection Kit is activated. Only activate the synchronization when the PowerBook is awake.

AddMotion: No Missing Disks in Apple Bundle (3/94)

Revised: 3/14/94
Security: Everyone

AddMotion: No Missing Disks in Apple Bundle (3/94)

==========

Article Created: 14 March 1994

TOPIC ----------

AddMotion from Motion Works is bundled with HyperCard 2.2 from Apple. Due to a change, cusomters may report that they are missing a disk mentioned in the AddMotion manual.

DISCUSSION ----------

Customers are not missing any disks. There is a change mentioned in the manual, but many customers are overlooking the change. Included in the AddMotion manual is a "Changes to Installation Procedure" sheet that clearly notes that "There is no longer a Media Sampler Disk" and "There is no longer a Principles of Animation Disk".

All customers who call inquiring about these disks should be informed of these changes, and reminded to call Motion Works USA, not Motion Works Canada for tech support. The Motion Works USA phone number is printed on a sticker applied to the front of the manual.

Apple Displays: No Shielding Suggestions For Interference (3/94)

Revised: 3/15/94
Security: Everyone

Apple Displays: No Shielding Suggestions For Interference (3/94)

==========

Article Created: 15 March 1994

TOPIC -----

A customer has multiple Apple monitors that shake and jiggle. None of the VGA monitors connected to MS-DOS computers exhibit this behavior. The company is located next to some older electrical lines and believes these to be the source of the problem. Are there any suggestions for shielding the monitors that will prevent the interference?

DISCUSSION -----

There is good chance that the problem could very well be related to arcing electrical lines. The reason the problem does not affect the VGA monitors is because they operate at a refresh rate of 60 Hz. The 60 Hz noise occurs at the exact time intervals that these displays are in refresh and therefore does not interfere with the screen display. When higher refresh rates are used, as in the case of Macintosh Displays, 60 Hz noise can adversely affect the display.

There are two things to try. First, turn off all the fluorescent lights in the office. If that cures the problem, you most likely have an arcing fluorescent lamp operating near the monitors. Replacement of the defective lamps or ballast should cure the problem. Also, try turning the monitor on its axis to see if that helps. There are no practical shielding solutions for a problem of this type.

AppleDesign Powered Speakers: AM Stations Amplified (3/94)

Revised: 3/15/94
Security: Everyone

AppleDesign Powered Speakers: AM Stations Amplified (3/94)

==========

Article Created: 15 March 1994

TOPIC --------------------

A pair of the AppleDesign Powered Speakers (M4475LL/B) are picking up AM radio signals. What can I do to prevent this?

DISCUSSION --------------------

This problem is very common, and does not reflect on the design of the speakers. The audio/video industry has been plagued with complaints of this nature for years. The problem is the speaker wires act as an AM antenna. The AM signal is picked up by the wires, and sent to the amplifier to be amplified along with the intended signal. If the pre-amp stage has a noise gate, like the inputs on the Apple Powered Speakers, the amplitude of the AM signal is usually not high enough to pass the gate, and it is not amplified.

The only thing that can be done to alleviate this problem is to purchase some higher quality shielded cables. Two possible sources are TASCAM and Monster Cable.

Again, this is not a design flaw in the speakers. Apple is responsible for designing equipment that adheres to Federal Communications Commission (FCC) regulations, and have done so with the AppleDesign Powered Speakers.

Another option is to log the interference complaint with the FCC. The FCC is the governing body for Radio Frequency (RF) emissions in the United States.

QuickTime 1.6.1: ReadMe (3/94)

Revised: 3/15/94
Security: Everyone

QuickTime 1.6.1: ReadMe (3/94)

==========

Article Created: 14 March 1994

WELCOME TO QUICKTIME 1.6.1

The QuickTime 1.6.1 software consists of

- the QuickTime system software extension
- a new version of the Macintosh Scrapbook
- a Scrapbook file with a sample movie

The QuickTime system software extension adds capabilities that let your application programs integrate graphics, sound, video, and animation into documents. By providing a standard way for all Macintosh programs to control these multimedia elements, QuickTime makes them easier to use.

In the new Scrapbook, you can cut, copy, paste, and play QuickTime movies. Larger images will also shrink to fit so that you can see the entire image in the Scrapbook window. This Scrapbook is otherwise identical to the standard Macintosh Scrapbook.

If you obtained QuickTime by purchasing it separately, by ordering it over the phone, or by downloading it from an electronic mail system, follow the instructions below to install the QuickTime extension and the new Scrapbook.

If QuickTime was already installed on your hard disk when you bought your computer, skip ahead to the section "Installing the Scrapbook."

INSTALLING QUICKTIME

To install QuickTime:

1. If you received a floppy disk labeled "QuickTime," insert it into your computer and open it. If you downloaded QuickTime electronically, make sure the QuickTime files you downloaded are visible.
2. Drag the QuickTime and Scrapbook icons from the QuickTime disk to your System Folder icon (not into the open folder).

3. Click OK in the dialog box that appears.
4. Restart your Macintosh.

INSTALLING THE SCRAPBOOK

Before you install the new Scrapbook file:

Installing the new Scrapbook File in your System Folder will delete your current Scrapbook File. If you have stored any items in your current Scrapbook that you want to keep, drag the Scrapbook File from your System Folder to any other folder. This prevents the file from being deleted when you install the new Scrapbook File. (To open the old Scrapbook File in the future, you'll need to move the new one out of your System Folder and move the old one back in.)

To install the new Scrapbook File:

1. Find the folder called Replacement Scrapbook File. (If QuickTime was already installed on your computer, this folder is on your computer's hard disk. If you obtained QuickTime separately, this folder is on the QuickTime disk.)
2. Drag the contents of the Replacement Scrapbook File folder to your System Folder icon.
3. If you haven't moved your old Scrapbook File out of the System Folder, a message asks you whether you want to replace it. Click OK to replace your old Scrapbook File.

To use the new Scrapbook File:

1. Choose Scrapbook from the Apple menu.
2. When a picture appears in the Scrapbook window, use the buttons in the movie control bar, to play the movie.

You can use standard Cut, Copy, and Paste commands to copy movies to and from the Scrapbook. To copy a movie from the Scrapbook to a document, you need to use a program that supports QuickTime movies. If the program doesn't support movies, only a single PICT image is pasted into the document (the first frame of the movie segment in the Scrapbook).

NEW FEATURES OF QUICKTIME 1.6.1

Smaller Size
The QuickTime 1.6.1 system extension takes up only about 20K of memory when it is not in use.

Converting Audio Tracks to Movies
You can convert tracks from audio compact discs into movies and add the sound to your own movies. To convert an audio track, you must be using a program that can play QuickTime movies, and you must have an AppleCD 300 or 300i CD-ROM drive connected to your Macintosh. Follow these steps:

1. Insert an audio CD into your computer's CD-ROM drive.

2. In the program you are using, choose Open from the File menu.

3. Click Desktop, then double-click Audio CD.

4. Click the name of the audio track you want to convert to a movie.

5. Click Convert.

6. Type a name for the new movie, and choose a place to save it.
To choose additional settings or to trim the length of the movie, click Options.

7. When you are ready to convert the movie, click Save.
The audio track is saved as a QuickTime movie. You can now copy and paste sound from it into other movies.

Macintosh Easy Open Support
QuickTime 1.6.1 supports the Macintosh Easy Open system extension. You can use this extension to translate sound and image files from a variety of formats into QuickTime formats--just by double-clicking them.

ColorSync Support
QuickTime 1.6.1 supports ColorSync. You can use the ColorSync control panel to obtain accurate color in your compressed still-image files, for all the devices connected to your Macintosh.

Improved Grayscale
QuickTime 1.6.1 now supports 4-bit grayscale dithering, providing a wider range of shades of gray.

Smoother Text
You can now have smoother-looking (anti-aliased) text in the text track of movies.

Cinepak Compression-Decompression Software
The Apple Compact Video compression-decompression software is now called Cinepak. The features and functionality of the software have not changed.

USING THE QUICKTIME EXTENSION

You do not interact directly with the QuickTime extension. It works behind the scenes as part of your system software, providing new features to the application programs that support QuickTime. The specific features of QuickTime that you use and how they are presented depend on the programs you use.

TO LEARN EVEN MORE

The best way to get started with QuickTime is to purchase the QuickTime Starter Kit from Apple Computer. This kit contains four programs with which you can play and edit QuickTime movies, convert existing files to movies, record video or audio movies (with digitizing hardware), and compress still photos. The kit also includes a CD-ROM disc filled with examples of QuickTime video, animation, and photos, and a catalog of products that work with QuickTime.

The QuickTime Starter Kit is available from your local hardware or software dealer.

Macintosh Application Environment (MAE): Description (10/94)

Revised: 10/13/94
Security: Everyone

Macintosh Application Environment (MAE): Description (10/94)

==========

Article Created: 15 Mar 1994
Article Reviewed/Updated: 13 October 1994

TOPIC ----------

This article describes the Macintosh Application Environment (MAE).

DISCUSSION ----------

The Macintosh Application Environment (MAE) is an X-Windows client that currently runs on a Sun SPARCstation or an HP 9000/700. MAE provides you with a complete Macintosh environment in an X Window.

Within this environment you can use Macintosh applications, print, move files, create folders, and copy and paste between Macintosh applications and UNIX applications.

MAE works within the industry-standard X Window System running on UNIX workstations. This means that you realize all the benefits of the Macintosh desktop while still gaining access to the UNIX environment and X Windows. You are able to resize the Macintosh X Window to any size desired.

MAE Emulation
==========

MAE emulates the Motorola 68LC040, but a number of the most used instructions have been translated into native UNIX code, thereby taking advantage of the native performance of the system CPU.

The 68K emulator handles instructions from the application by reading the application’s 680x0 code, and performing the equivalent sequence of instructions for the host’s RISC processor. To increase efficiency and processing speed, the emulator works hand-in-hand with a Mixed Mode Manager to make direct calls to the RISC processor whenever possible.

System 7 Support

==========

MAE supports System 7 version 7.1 features on top of UNIX. It is well integrated into the standard UNIX graphics system and the X Window System. You have access to Macintosh System 7.0 features such as Aliases, TrueType, AppleEvents, publish-and-subscribe, Balloon Help, QuickDraw, and 32-bit addressing. Version 1.0 of MAE does not support system extensions such as QuickTime. The Sound Manager and Serial Managers are also not supported. Any software product that requires direct access to the Macintosh hardware does not work.

You can access Macintosh high-density floppy disks and CD-ROMs using MAE.

Because the native UNIX operating systems don't handle floppy or CD interrupts in the same way that the Macintosh operating system does, a new button has been added for CD and floppy inserts. The button appears at the bottom of the Macintosh X Window. You insert the floppy or CD, and choose this button to have it mount on your desktop, within the Macintosh X Window.

MAE supports the Network File System (NFS), which lets you access, display, and manipulate remote and local Macintosh, PC, and UNIX files. The first version of MAE does not support AppleTalk, and behaves just like a Macintosh with AppleTalk networking turned off. This means that the Network extension, the File Sharing control panel, the Sharing Setup control panel, and the Users & Groups control panel are not shipped with MAE. Other areas normally associated with the Finder that are a part of MAE include: Finder Help, Labels control panel, and the Views control panel.

MAE lets you print UNIX and Macintosh files on printers that support PostScript, using the Apple Chooser and the Print command. It also includes QuickDraw to manage all graphics operations required by Macintosh applications.

MAE Components

Macintosh Application Environment consists of three distinct components:

Macintosh Desktop Services

Windows, menus, general Macintosh look and feel.

Macintosh Application Engine

Complete Macintosh run-time layer existing within the X Window. Macintosh applications and control panels and other elements of the Macintosh run as if on a Macintosh computer.

Macintosh System Services

File management, memory management, and system services. This is the portion that lets you manipulate both Macintosh files and UNIX files and applications.

The file manager seamlessly integrates the UNIX file system with the Macintosh file system. Similarly, UNIX printing is be accessible to Macintosh applications

through the Print Manager. A Macintosh user who happens to be using MAE should not see a major difference between it and a Macintosh.

Hardware Requirements

- Sun SPARC workstation running Solaris 2.3 or later
- HP workstation running HP-UX 9.01
- X Window System 11 release 4 or later
- Window Manager such as Motif or Open Look
- RAM: 16 MB minimum, 32 MB recommended
- Hard disk space: 16 MB minimum, 22 MB recommended for greater performance

Performance

You can expect anywhere from Macintosh LC to Quadra performance, depending on the platform, processor speed, and system resources of the system that it is installed on.

Application performance on MAE very much depends on the system in which it is installed. MAE is designed so that key components execute as native RISC code. Therefore, the more powerful the system and the greater the system resources (system cache, hard disk, and RAM) the better the MAE performance. It also employs an Operating System Access library to further take advantage of the native performance. The library lets the Macintosh Application Environment directly access the services provided by the host operating system, such as system calls or graphics library routines.

Language Kits: Changing File Names and Renaming Folders (3/94)

Revised: 3/15/94
Security: Everyone

Language Kits: Changing File Names and Renaming Folders (3/94)

==========

Article Created: 15 March 1994

TOPIC ----------

I have the Japanese Language Kit installed, and am trying to rename a folder in the Finder. The keyboard menu changes from U.S. System 7 (a blue diamond) to Kotoeri (a red sun with an apple) automatically. If I select U.S. System 7 in the keyboard menu, I can enter the name in English. Why does the keyboard layout switch occur?

DISCUSSION ----------

Apple Language Kits provide Finder support for English in addition to the other language each installs. When you modify a file or folder name, the language kit defaults to its primary keyboard layout: Japanese to Kotoeri; Traditional Chinese to Pin yin; Simplified Chinese to Shuru Fangfa.

The Japanese Language Kit displays keyboard layouts based on the 'Font for views' selected in the Views control panel. When 'Osaka' is selected, the keyboard menu will offer U.S. System 7 and Kotoeri because Osaka supports both character sets. Selecting a Roman-only font like Palatino or Helvetica displays U.S. System 7 in the keyboard menu.

The Chinese Language Kit behaves the same way. Selecting 'Beijing' as the 'Font for views' will display 'Shuru Fangfa' and U.S. System 7 layouts in the keyboard menu because 'Beijing' supports both Simplified Chinese and Roman character sets.

Similarly, selecting 'Taipei' displays Traditional Chinese and U.S. System 7 layouts in the keyboard menu because 'Taipei' supports both Traditional Chinese and Roman character sets.

LaserWriter Select 300: Word 4.0 Incompatible (3/94)

==========

Article Created: 11 Mar 1994

TOPIC ----------

There is an incompatibility between the LaserWriter select 300 and Word version 4.0.

DISCUSSION ----------

The word wrap is incorrect when using Word 4.0 and printing to a LaserWriter Select 300. Words are printed in the margins, or are printed on top of one another.

Version 4.0d is needed for compatibility. Contact Microsoft Corporation for an upgrade to Word 4.0.

Peter's Adventures CDs: System Freeze (3/94)

==========

Article Created: 15 March 1994

TOPIC --------------------

This article describes a problem with Peter's Adventures CDs with Virtual Memory (VM) running on a LC II. The system freezes.

DISCUSSION --------------------

On an LCII with 4 MB RAM running System 7.0, with Virtual Memory is active (4 MB real memory and VM set to 8 MB). When Peter's Alphabet Adventure is launched, the system locks or freezes when the first QuickTime element is played (at the first musical note).

This does not occur on the same Mac LCII running with VM turned off.

This occurs for Peter's Alphabet, Peter's Magic, and Peter's Number Adventures (versions that do not include the Sound Manager 3.0 fix).

There is no known workaround other than to turn VM off. In general, MultiMedia CDs should not be used in conjunction with VM since this will severely degrade the performance.

Rescue CD-ROM: Software Restoration Toolkit (3/94)

==========

Article Created: 15 March 1994

TOPIC -----

I've heard there's a Rescue CD-ROM called the Software Restoration Toolkit which contains net install versions of System Software, as well as bundled software for all Macintosh computers. How can I purchase a copy?

DISCUSSION -----

The Rescue CD-ROM you refer to is called the Software Restoration Toolkit and is solely for Authorized Service Providers to restore software bundles (System Software and bundled applications) to computers that have had hard disks repaired or replaced during service. If you are an Authorized Service Provider, you can purchase one from the Apple Service order line.

SAM 3.5.x & Apple File Exchange: Error Type 33 (3/94)

Revised: 3/15/94
Security: Everyone

SAM 3.5.x & Apple File Exchange: Error Type 33 (3/94)

==========

Article Created: 15 March 1994

TOPIC ----------

Using SAM 3.5.x and Apple File Exchange (AFE) together on any Macintosh, can cause AFE to quit with a type 33 error.

DISCUSSION ----------

There is a known conflict between SAM 3.5.x and Apple File Exchange. If SAM is turned on, and Apple File Exchange is used with only the translator that comes with it, then Apple File Exchange will quit with a Type 33 error.

Symantec is aware of the problem, and has suggested as a workaround to install additional translators in the Apple File Exchange folder. Even just one additional translator seems to fix the problem. It will also work if there is just one translator, as long as it is not the one that came with Apple File Exchange. Symantec is sending out a "dummy" translator to customers that isn't functional, but the presence in the AFE folder solves the problem. Any other translator will also work, MacLink translators for example.

Version 3.5.9 of SAM does not fix the problem, but a future version of SAM will. There is currently no estimated release date for a version that will fix this problem. Customers can either be referred to Symantec for the workaround translator, or encouraged to use PC Exchange instead of Apple File Exchange.

Writing Center: Reinstall Problems (3/94)

==========

Article Created: 15 March 1994

TOPIC ----------

I am trying to reinstall my Writing Center application from my Apple Early Language Connections Backup CD. When I click on Customize, I do not see it listed. Where is it?

DISCUSSION ----------

When you click on Customize on the Apple Early Language Connections Backup CD, the Writing Center is not one of the options available. If you click on Teacher's Software (either version 7.0 or 7.1), you will find the Writing Center as an option to install. So, first click on Teacher's Software for your specific System Software version, and then click install.

Radius Video Cards: Pointer Freezes With System 7 (6/95)

==========

Article Created: 15 March 1994
Article Reviewed/Updated: 6 June 1995

TOPIC ----------

After installing System 7.x on my Macintosh computer with a Radius video card, the pointer freezes in the upper left corner of the display. What is causing this?

DISCUSSION ----------

This is caused by incompatible ROMs on the Radius Video card.

Workarounds

- Go back to an earlier version of Apple System software (6.0.8 or earlier).

- Contact Radius to update the ROMs. If the card is under warranty, the upgrade is free. If the card is not under warranty there is a cost to upgrade the ROMs.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Radius, for additional information.

CD300i Plus: Removing Stuck CD-ROM (3/94)

==========

Article Created: 16 March 1994

TOPIC ----------

I have a CD-ROM installed in my CD300i Plus drive, but I don't have an icon for it on the desktop and the tray will not open when the Open/Close button is pushed. How do I remove a stuck CD-ROM?

DISCUSSION ----------

WARNING: Turn off your computer before you attempt to eject the tray using a paper clip. If you don't turn off the computer, you may damage the CD-ROM drive.

1) Turn off your computer

2) Locate the small pinhole to the lower right of the CD-ROM tray opening.

3) Insert the end of a large straightened paper clip firmly and horizontally into the pinhole.

4) Push gently until the tray is released, then carefully pull the tray open.

Do not force the tray open; wait until the paper clip has dislodged it or you may break the front of the tray.

Macintosh AV Series: Common Video Playthrough Solutions (5/95)

==========

Article Created: 16 March 1994
Article Reviewed/Updated: 31 May 1995

TOPIC

This article discusses a few common problems on the Macintosh AV computers and using video capture or playthrough.

DISCUSSION

Video Application Does Not Show A Video Window

If you launch a video application, such as VideoMonitor or FusionRecorder, and do not get a video image, there are two possible reasons:

• Your monitor is connected to a NuBus video card instead of the on-board video. To do capture or playthrough, the computer must have a monitor connected to the on-board video, even if you have a second monitor connected to a NuBus video card and are running the video application on that monitor.

• The video application may already be launched. Check the Application Menu to see if the video application is already open. If so, make the application the current window. Then for VideoMonitor, choose Open from the File menu. For FusionRecorder, choose Show Record Window from the Record menu.

Cannot Display Video While In The Current Number Of Colors

If you get the error message "The Built-In Digitizer cannot display video while in the current number of colors". Use your Monitors control panel to select Thousands or 256 colors. This is necessary because the video RAM (VRAM) must be shared between the monitor and the incoming video.

No Built-in Digitizers Are Available

If you are trying to switch the image from your Macintosh monitor to a TV monitor and you get the message "there are no built-in digitizers available", it is because your monitor is connected to a NuBus video card. You must have a monitor connected to your on-board video for this to work.

Other possible causes include the AV card being loose and not seated properly, or system software corruption. The affected component is usually the QuickTime extension. Reinstallation of the QuickTime extension would be the first troubleshooting step followed by a clean system software install.

The Image In Your Video Window Has Black Lines And Scrolls Upwards

---

You need to change the video source to NTSC. In Video Monitor, go into the Monitor menu, choose Video Settings, then from the pop-up menu in the upper left, choose Source, and for Format select NTSC. In FusionRecorder, go into the Record menu, choose Video Settings, and choose Format: NTSC. In any other application, refer to the documentation or software publisher for assistance.

Kid Works 2: File Menu Items Grayed Out (1/95)

Revised: 1/19/95
Security: Everyone

Kid Works 2: File Menu Items Grayed Out (1/95)

==========

Article Created: 17 March 1994
Article Reviewed/Updated: 09 January 1995

TOPIC ----------

When running Kid Works 2 on my Macintosh I cannot select Quit from the File menu. The Preferences menu item in the Options menu is also grayed out.

DISCUSSION ----------

You have most likely turned on Child Safety Mode. This option grays out Quit in the File menu and the Preferences menu item in the Options menu. This feature also does not allow you to select another item in the Applications menu.

There are two ways to resolve this issue. You can throw away the Kid Works 2 Preferences file from the Preferences folder inside the system folder.

The other alternative is to hold down the Command and Shift keys before opening the File menu which will allow you to select Quit. You can also hold down the Command and Shift keys while opening the Options menu, select Preferences, and turn off Child Safety Mode.

Power Mac 8100/80: PDS Video Card vs. Third-Party Cards (4/95)

==========

Article Created: 17 March 1994
Article Reviewed/Updated: 26 April 1995

TOPIC -----

I need the specification on the 4MB Power Macintosh Video Card for the Power Macintosh 8100. I'm interested in refresh speed and a quantifiable way to compare the performance of this card to an accelerated video card.

DISCUSSION -----

Given equivalent VRAM configuration and price range, the 4MB Power Macintosh Video Card should run faster than any comparable third party video accelerator cards in today's marketplace. This is due to the video card's high data transfer rate, which is in part attributed to its 64-bit data bus as compared to the 32-bit data bus available to NuBus video cards.

FAX Blind Dialing and LaserWriter Select 360 (3/94)

Revised: 3/18/94
Security: Everyone

FAX Blind Dialing and LaserWriter Select 360 (3/94)

==========

Article Created: 17 March 1994

TOPIC ----------

Is there a way to have the FAX card on the LaserWriter Select 360 perform a "blind dial" (dial without needing a dial tone)?

DISCUSSION ----------

There is a %Fax% PostScript device parameter WaitForDialTone which controls this. This is a boolean parameter which if set to FALSE, will permit the FAX card to do "blind dialing". If set to TRUE, the FAX card will insist on receiving a dial tone first. The following PostScript segment will set this parameter:

```
(%Fax%) <</WaitForDialTone false>> setdevparams
```

If you would like this setting to persist beyond power cycles, then the following PostScript code which exits the PostScript server loop, must precede the command line above:

```
serverdict begin 0 exitserver
```

LaserWriter Select 310: No support for 8.x Driver (3/94)

Revised: 3/18/94
Security: Everyone

LaserWriter Select 310: No support for 8.x Driver (3/94)

==========

Article Created: 18 March 1994

TOPIC -----

Does the LaserWriter Select 310 support any of the LaserWriter 8.x features? I specifically want to know this information:

- Can the Select 310 use an "installed and preferred" option for selecting paper trays as does the LaserWriter 8.x driver?
- Can the Select 310 driver continue to draw paper from an additional cassette if the first cassette runs out?
- Can the 310 draw the first sheet from one tray and all remaining pages from a second tray?
- Can the Select 310 handle "n-up" reductions when printing multiple pages?
- Does the Select 310 offer any kind of resolution enhancement?
- Is Apple considering releasing a serial version of the LaserWriter 8.x driver?

DISCUSSION -----

The LaserWriter Select 310 does not support the LaserWriter 8.x printer driver, and so does not support a lot of the features you asked about.

- Can the Select 310 use an "installed and preferred" option for selecting paper trays as does the LaserWriter 8.x driver?

  This is not possible as the LaserWriter Select 310 driver does not save any preference information in the LaserWriter 8 Prefs file as does the LaserWriter 8 driver, nor does it have the "Auto Select" feature to execute it.

- Can the Select 310 driver continue to draw paper from an additional cassette if the first cassette runs out?

  No. Tray Switching is not implemented in the LaserWriter Select 310 Driver.

- Can the 310 draw the first sheet from one tray and all remaining pages from a second tray?

  This is a built-in feature of the LaserWriter Select 310 driver and can be used via the Print dialog box.

- Can the Select 310 handle "n-up" reductions when printing multiple pages?

  No. This feature was not implemented in the LaserWriter Select 310 driver, so you cannot print multiple pages on one sheet of paper.

- Does the Select 310 offer any kind of resolution enhancement?

  The only type of enhancement offered is via the ability to change "Print Density" in the Options dialog within the Print dialog.

- Is Apple considering releasing a serial version of the LaserWriter 8.x driver?

  No, Apple has no plans to release a serial version of the LaserWriter 8.x printer driver.

Color StyleWriter Pro: Color Discrepancies (7/95)

==========

Article Created: 18 March 1994
Article Reviewed/Updated: 17 July 1995

TOPIC ----------

I cannot get the Color StyleWriter Pro to print Reflex Blue. When I try it looks purple. How true of a blue can I print?

DISCUSSION ----------

Colors may differ from the screen when printed to the Color StyleWriter Pro. For example, Reflex Blue may look purple when printed. This is due to the following:

• Monitors "emit" colored light, whereas, colors on a printed page are "reflected" by whatever the light source may be. This has a large effect on the colors our eyes perceive.

• The Apple monitors are for the most part blue-ish in color, so this component also affects the colors that we see.

• There is a limitation of the ink and the color space that can be produced by printers. Basically, all printers (including non-Apple color printers) in this price range can only produce a subset of the CMYK color space. With some programs, you may be able to modify the CMYK values to alter the numbers a bit, which may help to produce specific colors you need.

ColorSync goes a long way in synchronizing the monitor with the printer, so Apple suggests that you use ColorSync and select the respective Color Matching Methods for your monitors or printers.

ARA, Personal FileSharing: Can't Find File Server On Net (3/94)

==========

Article Created: 16 March 1994

TOPIC -----

If I dial into a network with Apple Remote Access (ARA) 2.0 and the Macintosh that is dialing in has personal file sharing turned on with a name the same as a server on the dialed-in network zone, the server becomes unavailable. Sometimes I see two servers sometimes one server, but every time I try to log in to a server I log in to the ARA Client.

What I've found as a short term solution is to move the ComServer to its own zone with nothing else on it, but this problem still exists. Users can still setup individual ARA servers on their Macintosh computers thus opening up the possibility of further problems on the network.

DISCUSSION -----

Some quick workarounds are:

- Use the Remote Only setting in the Network control panel, this is exactly one of the situations it was designed to handle.

- Turn off FileSharing at the ARA client.

- Advertise the names of the servers on the ARA Server's zone and tell people not to use them as their personal server names.

NOTE: If you were to try to bring up a personal server with the same name as an existing one while already connected to the network you are told the name is in use and to select another. You will get the same error if you attempt to change the name of an existing FileSharing server to that of an existing server. This is not an ARA limitation, it just gets more complicated with ARA since both servers are already up when the ARA client joins the network.

SNA•ps Gateway to AS/400 Configuration (3/95)

Revised: 3/29/95
Security: Everyone

SNA•ps Gateway to AS/400 Configuration (3/95)

==========

Article Created: 14 March 1994
Article Reviewed/Updated: 29 March 1995

TOPIC ----------

This article outlines the SNA•ps Gateway software configuration for connection to an IBM AS/400.

DISCUSSION ----------

The first part of this article shows a Token Ring configuration; the second part shows an SDLC Serial configuration. There is no SNA•ps support for Twinax connections to the AS/400.

The SNA•ps software will only run on Apple 4/16 Token Ring or Serial NB communications cards. Apple Computer's cards are MCP (Macintosh Coprocessor Platform) compliant. Before beginning the SNA•ps software configuration, be sure you have installed an Apple 4/16 Token Ring or Serial NB card and that the card has a minimum of 1 MB RAM installed (Use Macintosh Coprocessor Platform Memory Expansion Kit - M0145LL/A).

NOTE: Apple Computer's MCP communications cards (Apple Token Ring 4/16 NB Card, and Apple Serial NB Card) will NOT fit in the Centris or Quadra 610, 660AV, Power Macintosh 6100/60, or Workgroup Server 6150. The Apple Token Ring NB/c card does not support the SNA•ps Gateway, SNA•ps 5250 or SNA•ps 3270 software.

Token Ring
==========

From the Macintosh Control Panel, open the Token Ring control panel window and note the Apple 4/16 Token Ring card's network address. This will correspond to the AS/400 Controller LAN remote adapter address.

SNA•ps TR Line Description

TR Line Name:	LINE01
All timers at default values	
Maximum I-Field Length:	2057

SNA•ps Partner Description

Partner Name:	HOST01
Peer (Node type 2.1)	
SAP Address:	04
Link Address:	Corresponds to AS/400 TR Line local adapter address
Partner XID:	056XXXXX - AS/400 TR Line exchange ID
Gateway XID:	050XXXXX - AS/400 Controller exchange ID
Gateway Network Name:	AS/400 Controller remote control point
Gateway Network Qualifier:	AS/400 default network ID

SNA•ps Local LU

Name:	PASSTHRU - Apple default
LU ID:	01 - Must be unique
Max TPs:	Must match the AS/400 Mode maximum sessions (Typically 10, 35, or 70)
Network LU Name:	LU01 - AS/400 Device remote location name
Network Qualifier:	APPN - AS/400 Local network ID

SNA•ps TPs

TP Name:	* - Allows all transaction programs
All other parameters at Apple default.	See SNA•ps Gateway Configuration Guide for details.

SNA•ps Remote LU

Name:	AS400
Parallel Sessions	
Network LU Name:	AS400 - AS/400 Default local location name
Network Qualifier:	APPN - AS/400 Local network ID

SNA•ps Mode

Name:	MACMODE - Must match AS/400 Mode name. You cannot use QPCSUPP.
Queue Binds	
Maximum Sessions:	Same value as AS/400 Mode description maximum sessions
Contention Winner:	Same as maximum sessions. AS/400 Mode locally controlled sessions=0.
Prebound Sessions:	Same as maximum sessions. AS/400 Mode Pre-established sessions=0.
Pacing at default	
Maximum RU Upper:	2048
Maximum RU Lower:	256

SDLC
====

SNA•ps SDLC Line Description

Name:	LINE01
Port:	1A and 1B for use with V.35. 2A and 2B for use with V.24. Use Half Duplex for dial-up and multidrop lines. Be sure AS/400 line data link role is set to negotiated. Set SNA•ps line to Secondary.
All timers at default values.	

SNA•ps Partner Description

Name:	HOST01
Peer (Node Type 2.1)	
Link Address:	C1 - Must match AS/400 SDLC Line station address
Partner XID:	056XXXXX - AS/400 Line exchange ID
Gateway XID:	050XXXXX - AS/400 Controller exchange ID
Gateway Network Name:	AS/400 Controller remote control point name
Gateway Network Qualifier:	APPN - AS/400 local network ID

SNA•ps Local LU

Name:	PASSTHRU - Apple default
LU ID:	01 - Must be unique
Max TPs:	Must match the AS/400 Mode maximum sessions (Typically 10, 35, or 70)
Network LU Name:	LU01 - AS/400 Device remote location name
Network Qualifier:	APPN - AS/400 Local network ID

SNA•ps TPs

TP Name:	* - Allows all transaction programs
All other parameters at Apple default.	See SNA•ps Gateway Configuration Guide for details.

SNA•ps Remote LU

Name:	AS400
Parallel Sessions	
Network LU Name:	AS400 - AS/400 Default local location name
Network Qualifier:	APPN - AS/400 Local network ID

SNA•ps Mode

Name:	MACMODE - Must match AS/400 Mode name.
.	You cannot use QPCSUPP.
Queue Binds	
Maximum Sessions:	Same value as AS/400 Mode description
.	maximum sessions
Contention Winner:	Same as maximum sessions. AS/400 Mode
.	locally controlled sessions=0.
Prebound Sessions:	Same as maximum sessions. AS/400 Mode
.	Pre-established sessions=0.
Pacing at default	
Maximum RU Upper:	2048
Maximum RU Lower:	256

Before starting the gateway, verify that the AS/400 Line, Controller, and Device are Active or Varied On. Also, verify the AS/400 system value QAUTOVRT. This value must be a non-zero number in order for the AS/400 to automatically configure the virtual controller and virtual devices required by the Display Station Pass-Through application.

See the SNA•ps Gateway Configuration Guide Appendix B for more details on AS/400 configuration.

Article Change History:
29 Mar 1995 - Added Workgroup Server 6150 and updated format.
19 Sep 1994 - Added info on Token Ring NB/c card.

CD Speed Switch: Compatibility With 68LC040 Computers (4/95)

Revised: 4/5/95
Security: Everyone

CD Speed Switch: Compatibility With 68LC040 Computers (4/95)

==========

Article Created: 29 March 1994
Article Reviewed/Updated: 05 April 1995

TOPIC ----------

I have a LC 475 with an external AppleCD 300 drive. When sound is played from my Time Almanac CD, the sound is choppy. When I double-click on the CD Speed Switch Control Panel, as explained in Apple's documentation, I get a message that the control panel can't be used on that model of Macintosh.

DISCUSSION ----------

There are two separate issues involved in this situation. First, the AppleCD Speed Switch software is not compatible with computers using the 68LC040 microprocessor. This includes the LC 475, 476, 575, Quadra 605, Quadra 610, and many PowerBook models. Check the specification sheet for your computer to verify it it has a 68LC040 processor.

You should install version 5.0 or greater of the CD-ROM software for the CD-300 external drive. This version is fully compatible with the LC 475 and has the equivalent of the Speed Switch integrated into the driver. This version of the CD-ROM driver has been tested with the LC 475 and it works just fine, it did not solve the choppy sound problem however.

The second issue revolves around the Time Almanac CD itself. Testing the Time 1993 Almanac with the LC 475 produced the same audio results as the you encountered. Playing the Almanac's movies with the Apple MoviePlayer program works fine. So, it seems that the problem was with the Time Almanac application.

Compact Publishing, Inc. said they were aware of the problem and are working on a patch to resolve it. Contact them directly to receive the patch when it becomes available.

To find the latest version of the CD-ROM software, search for these articles:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates
- Obtaining Apple Product Support in the USA
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Article Change History:
05 Apr 1995 - Added Centris 610 to list of 68LC040 computers
05 May 1994 - Made article more generic on version numbers and on-line software resources.

A/UX 3.1 Console Emulator Problem and Workaround (3/94)

Revised: 6/22/94
Security: Everyone

A/UX 3.1 Console Emulator Problem and Workaround (3/94)

==========

Article Created: 23 March 1994

TOPIC ----------

The A/UX 3.1 console emulator will hang if CONTROL-S is used to stop the display from scrolling. This is due to a bug in the streams code. The following ADB patch addresses this problem. Engineering does not expect this to be a significant problem since the large majority of our customers do not use the Console Emulator.

DISCUSSION ----------

NOTE: This problem has to do with the console emulator, not the console in the command shell.

Patch to fix the problem:

```
cd   /etc/config.d
adb -w newunix
getq_loop1+16?W   0x2e8a4eb9
getq_loop1+1a?W   0x100540a4
getq_loop1+1e?w   0x602e
```

To confirm that the patch has been entered correctly, the disassembled code should closely resemble the following:

```
getq_loop1+16?i     mov.l   %a2,(%a7)
getq_loop1+18?i     jsr     qenable
getq_loop1+1e?i     bra.b   getq_done1
```

After applying this patch with adb, you must run:

```
newconfig
```

and restart the system

Portable StyleWriter: Print Dialog Box Time Varies (3/94)

Revised: 3/25/94
Security: Everyone

Portable StyleWriter: Print Dialog Box Time Varies (3/94)

==========

Article Created: 24 March 1994

TOPIC ----------

The Portable StyleWriter manual states that after you click Print in the Print dialog box, a message appears on your screen for a few seconds, then disappears. The Dialog box stays on my screen longer, is the manual incorrect?

DISCUSSION ----------

The proper time frame for seeing the Print dialog box is actually dependent on if background printing is enabled or disabled, as well as the length of the print job. Thus, the dialog can remain on the screen for as little as a few seconds, or may last much longer if background printing is OFF or if you are printing a large job.

Performa 550: Description of Backup Partition (3/94)

Revised: 3/22/94
Security: Everyone

Performa 550: Description of Backup Partition (3/94)

==========

Article Created: 22 March 1994

TOPIC -----

What is the Backup Partition on the Performa 550?

DISCUSSION -----

The Apple Backup application creates a backup recovery partition that allows the Performa to boot even when the System Software on the main hard drive has been corrupted. The partition is invisible to the user.

When a system problem (one that prevents the Performa from booting) is detected, a dialog is displayed that informs the user of a system problem. The user can choose to fix the problem manually or to reinstall software from the backup partition's Mini System Folder. If the user chooses to install software from the Mini System Folder, the cursor becomes a watch, the hard disk spins for a brief time, the Mini System Folder is copied to the main volume and the system restarts booting from the main volume. The backup is then reset to invisible. The user can then copy the System, Finder and System Enabler to the main System Folder.

There is no built-in limit to the number of times the backup partition can be used. However, the partition will be lost if the hard drive is re-formatted. At this time the backup partition is used only on the Performa 550.

ARA: Modifying Serial Port B & MacEKG (3/94)

Revised: 3/22/94
Security: Everyone

ARA: Modifying Serial Port B & MacEKG (3/94)

==========

Article Created: 15 March 1994

TOPIC --------------------

MacEKG shows that ARA is touching, and modifying the node id of serial port B, even though the modem in the modem port, port A. The node id bounces around whenever he chooses "answer Calls" in the setup. Why is ARA doing anything to serial port B?

DISCUSSION --------------------

Micromat Tech Support indicates that they have had similar problem reports recently. MacEKG should be performing its tests before any other software is loaded, including ARA.

The workaround is to rename the control panel "•MacEKG" to " MacEKG™" (three spaces at the beginning of the name) and to move it from the Control Panels folder to the Extensions folder. This should ensure that MacEKG is indeed loading first. Once this is done MacEKG should no longer report that port B is being "touched", according to Micromat Tech Support.

HyperCard:Problem Pasting Fields-Bad Script (3/94)

Revised: 3/22/94
Security: Everyone

HyperCard:Problem Pasting Fields-Bad Script (3/94)

==========

Article Created: 22 March 1994

TOPIC --

I am trying to paste the card number field from "Display the card number" from Readymade Fields Stack into the Addresses stack in HyperCard 2.2, but it's not working. It pastes fine into a new blank field. Both stacks come on the standard HyperCard distribution disks.

DISCUSSION --

The problem is with the script in the stack that came with HyperCard.

Below is a portion of the original script.

```
on addStackScript fieldType
  get script of fieldType
  if "openCard" is in it then
    if (fieldType && "field id" && id of me) is not in it then
      put scriptBody(fieldType) & return after char ¬
      (offSet("openCard",it) + 8) of it
      set script of fieldType to it
    end if
  else
    if it ≠ empty then
      if last char of it = return then put return after it
      else put return & return after it
    end if
    -- write the full handler
    put "on openCard" & return & scriptBody(fieldType) & return & ¬
    "pass openCard" & return & "end openCard" after it
    set script of fieldType to it
  end if
end addStackScript
```

The first "if" statement (if "openCard" is in it then) should really test for

"on openCard" instead of "openCard". Many stacks list handlers included in a script at the top of the script. This allows programmers to easily search a script for a particular handler. The addresses stack does this. When this button is pasted into it, the "openCard" in the handler list makes the conditional true and the script to include the card number is pasted into the handler list (where it will never execute).

Change"openCard" to "on openCard" in two places (as below in line 3 and 6) and the script works as advertised.

```
on addStackScript fieldType
  get script of fieldType
  if "on openCard" is in it then
    if (fieldType && "field id" && id of me) is not in it then
      put scriptBody(fieldType) & return after char ¬
      (offSet("on openCard",it) + 8) of it
      set script of fieldType to it
    end if
  else
    if it ≠ empty then
      if last char of it = return then put return after it
      else put return & return after it
    end if
    -- write the full handler
    put "on openCard" & return & scriptBody(fieldType) & return & ¬
    "pass openCard" & return & "end openCard" after it
    set script of fieldType to it
  end if
end addStackScript
```

Express Modem: Fax Queue & Phone Number Limits (3/94)

==========

Article Created: 23 March 1994

TOPIC ----------

How many fax documents can be placed in a queue, and how many addresses can be added to the phone number data base for the Express Modem software?

DISCUSSION ----------

There is no actual limit to the number of faxes you can have in the queue. You will be limited by hard drive space, and memory allocation. In testing we were able to get up to 145 recipients in the Send To without any problem.

The address book will hold up to 1000 addresses.

Apple Multiple Scan 20 Display: Text Appears Large (3/94)

==========

Article Created: 24 March 1994

TOPIC --------------------

Shopping around for monitors today, I looked at 14, 16 and 20-in monitors. The spreadsheet file we had been using as a sample was not much wider on the 20-in monitor. In fact, the type was about 25% larger on the Apple Multiple Scan 20 Display than on a 14-in or 16-in display. Why?

DISCUSSION --------------------

Depending on the resolution of the monitor, the text can appear to be 25% larger. This monitor can display information in one of four selectable resolutions. The resolution changes are implemented through the Monitors control panel. All changes take place immediately, so you do not have to reboot to see the resolution change.

The four resolutions are:

- 640x480 --Presentation view (this is the one that you probably saw)
- 832x624 --Publishing view
- 1024x768 --Two-page layout view
- 1152x1024 --Enlarged layout view

QuickTake 100: No OCR Support (3/94)

==========

Article Created: 23 March 1994

TOPIC -----

Can I use the Apple QuickTake 100, like I would a scanner and take pictures of a document, then use Optical Character Recognition (OCR) software to convert the picture into text?

DISCUSSION -----

Apple does not support this. One of the main problems would be the focal range. The QuickTake 100 has a 4-foot focal range. At 4-feet, the document image is too small to use with OCR software.

LaserWriter Pro 810: Time Out Error Using LocalTalk (3/94)

Revised: 3/23/94
Security: Everyone

LaserWriter Pro 810: Time Out Error Using LocalTalk (3/94)

==========

Article Created: 17 March 1994

TOPIC ----------

What causes time out errors when two or more documents are spooled to the LaserWriter Pro 810 connected using AppleTalk?

DISCUSSION ----------

When additional RAM is added to the LaserWriter Pro 810, the configuration changes, and the Macintosh needs to be aware of these changes. If extra memory is added without changing the memory configuration, then time out errors occur.

Changing Memory Configuration
---

1) Open the Chooser
2) Select the LaserWriter 8 icon
3) Click the Setup button
4) Click the Configure button
5) Change the memory configuration to match the amount installed in the LaserWriter Pro 810

Newton MessagePad 100: Clock Gains Time (3/94)

Revised: 3/23/94
Security: Everyone

Newton MessagePad 100: Clock Gains Time (3/94)

==========

Article Created: 17 March 1994

TOPIC -----

What causes the clock in the Newton MessagePad 100 to gain time and how can I fix it?

DISCUSSION -----

There are two things that could cause the clock to gain time.

1) The Newton was previously in a diagnostic mode. The clock's speed is too fast in the diagnostic mode for everyday use. If the Newton is not reset after leaving diagnostic mode, then the clock continues to run fast. Reseting the Newton returns the clock to normal speed.

2) A faulty battery cell also causes the clock to skip ahead. Usually this happens if you are using the rechargeable battery pack but it can also happen with alkaline batteries. If you are using a rechargeable battery pack, try to drain the battery and then recharge the battery in the Newton recharger. If the clock still has problems, have the rechargeable battery pack serviced. One of the battery cells may not be charging properly. If you are using alkaline batteries, make sure all the batteries are from the same package. You should not mix old and new batteries.

LaserWriter Select 360: Fax Dates & Times Incorrect (2/97)

Revised: 2/21/97
Security: Everyone

LaserWriter Select 360: Fax Dates & Times Incorrect (2/97)

==========

Article Created: 23 March 1994
Article Reviewed/Updated: 21 February 1997

TOPIC ----------

On all the faxes I send or receive, the time and date is incorrect. The year is always set to 1980 and the time does not change. How can I correct this?

DISCUSSION ----------

The optional fax card for the LaserWriter Select 360, uses a clock chip with a 3.6 volt lithium battery. If the fax card was shipped without setting the time and date, then it must be set before the clock starts keeping time. The LaserWriter Fax Utility allows you to set the date and time.

If the fax card contains a dead battery, then you could set the proper time and date, but the card would continually lose the time and date. If this happens, you need to replace the battery (service part number 742-0011*).

*NOTE:
Service parts can only be ordered by authorized Apple Service technicians. These parts are not available to the general public because only authorized Apple technicians are approved to install them.

The part numbers mentioned in this article are accurate as of this writing. Before ordering or inquiring about an order, you need to verify the number is still correct, as they are subject to change.

Article Change History:
21 Feb 1997 - Added info about part number.

Apple IIe Card: How To Partition the Hard Drive (7/96)

Revised: 7/15/96
Security: Everyone

Apple IIe Card: How To Partition the Hard Drive (7/96)

==========

Article Created: 23 March 1994
Article Reviewed/Updated: 9 July 1996

TOPIC ----------

This article explains the steps needed to partition a hard disk for the IIe Card for the LC series, Performa 400 series, Performa 550, Quadra 605 and the Color Classic computers.

DISCUSSION ----------

Protecting the disks

Before proceeding, lock the disks that came with the Apple IIe Card

- "IIe Installer Disk"
- "IIe Startup Disk"

Locking a disk protects its files from being changed or erased.

To lock a disk, slide the plastic tab on the back upper left-hand corner of the disk from the bottom to the top. When you can see through the hole, the disk is locked.

Reserving hard disk space for Apple IIe files

You can use a portion of the hard disk connected to your Macintosh computer to store Apple IIe files. The hard disk can be built into the Macintosh or connected by a SCSI cable. The process of reserving part of the hard disk for Apple IIe files is called partitioning the hard disk.

Partitioning a hard disk completely erases all files stored on it. Before partitioning your hard disk, you must make backup copies of any files you want to keep. This section explains:

- Backing up the contents of your hard disk
- Creating an Apple IIe partition on your hard disk
- Restoring the original contents of your hard disk

Backing up your hard disk

To back up your hard disk, follow the steps in this section. If you normally use another method of backing up your files, such as copying them to another hard disk or to a tape cartridge, you can use that method instead.

You do not need to back up your System Folder, because you have System disks. You only need to backup things you have added to the System Folder. In addition, you don't need to back up any applications that you have on original disks.

Performa Owners - Use the Apple Backup program that was installed on your computer to perform your backup. Make sure that you backup your entire hard drive, not just the System folder. Once you finish backing up with Apple Backup, skip to the section "Partitioning Your Hard Disk".

Step 1

Turn on your Macintosh computer. If your computer is already on, quit any programs you are running.

Step 2

Insert a blank 3.5-inch floppy disk into the built-in disk drive. If you see a message asking if you want to initialize the disk, click Initialize. If you are using an 800K disk, click Double-Sided.

Note:
If you are using PC Exchange, choose Macintosh 800K. Double-Sided does not appear when you use PC Exchange.

Step 3

Copy your files and folders to the floppy disk. Drag each icon from your hard disk to the floppy disk's icon until you get a message that the floppy disk is full. Then eject the floppy disk and repeat the procedure until you've backed up all the files you want to save.

Some folders may be too big to fit on floppy disks. If so, you can open the folder and drag its contents one icon at a time to the floppy disk icon.

For more information about copying files and folders, see the manual that came with your Macintosh computer.

Step 4

Label the disks so you can remember what is on them.

Partitioning your hard disk

This section explains how to partition your hard disk using a program called Apple HD SC Setup.

- The procedure described in this section sets aside 10 MB (megabytes) of space for Apple IIe files. If you need a different amount, turn now to Appendix C. "Creating Custom Partition", of the Apple IIe Card Owner's Guide. When you finish, skip to the next section in this chapter, "Restoring the Contents of the Hard Disk."

- Follow these steps to partition the hard disk:

WARNING:
Partitioning erases all information stored on your hard disk. To preserve your information, see the previous section, "Backing Up Your Hard Disk".

Step 1

Turn off your Macintosh computer. Choose the Shut Down command from the Special menu. You do not have to turn off the power.

Step 2

Insert the Disk Tools disk (from System 7 disks) into the built-in disk drive. Performa owners - Use the Utilities disk in place of the Disk Tools Disk.

Step 3

Turn on the Macintosh. Click the Restart button if your Macintosh is already on; otherwise, turn on the power.

Step 4

If necessary, open the Disk Tools or Utilities disk by double-clicking its icon. The disk's window appears.

Step 5

Double-click the Apple HD SC Setup icon. The Set up program opens.

Step 6

If you have more than one hard disk, click the Drive button to select the one that you want to partition.

Step 7

Click the Initialize button. A dialog box appears to confirm that you want to

erase your hard disk.

Step 8

Click Init in the dialog box. Once the initialization is complete, click the Partition button. A dialog box appears to confirm that you want to erase your hard disk.

Step 9

Click OK in the dialog box.

Step 10

Click "10 MB ProDOS, Maximum Macintosh", then click OK. The program takes a few moments to partition the disk drive and then asks you to name the new Apple IIe partition.

Step 11

Type a name and then click OK. The dialog box appears with a suggested name in it. As soon as you start typing, the suggested name is replaced by what you type.

You can give the new partition any legal ProDOS name, and you can use lowercase letters. ProDOS names can not have any special characters, and they must begin with a letter, as opposed to a number. The program does not let you continue if you used an illegal name. The program informs you of any illegal names.

Step 12

Click Quit. You return to the regular desktop.

(NOTE: The new partition appears only after you reinstall the Macintosh system software and then install the IIe Card software - see the following steps).

Reinstalling your System 7.x Software
=====================================

After completing the Partition, choose Restart from the Special menu. The computer will turn on and you will see a disk with a flashing or blinking ?.

Insert the Install or Install Me First disk that came with your Macintosh computer. When you get to the "Welcome to the Apple Installer" screen click OK.

Note:
Performa Owners - Use the Utilities Disk and the Apple Restore application to place the software on your computer.

Make sure that your Macintosh hard disk is selected (if not, click the Drive button) and then click Install. Follow the computer's directions.

When the computer has finished installing system software you will see "The

installation has been successfully completed". Click Quit and then click Restart.

Installing your IIe Card Software

After the computer has restarted insert the "IIe Installer Disk".

If needed, double-click on the disk icon. Then double-click on the "Installer" icon.

When you get the message that the "Installation was successfully completed" click Quit and Restart."

After restart, the Apple IIe partition mounts on the desktop.

Article Change History:
09 Jul 1996 - Removed keyword no longer a fax document.
28 Jun 1996 - Updated text format in step 12; added statement to last section to indicate point the IIE partition mounts.
24 Feb 1995 - Updated format and corrected note in Reserving Space.

Adjustable Keyboard: Software Part of System Update (2/95)

Revised: 2/27/95
Security: Everyone

Adjustable Keyboard: Software Part of System Update (2/95)

==========

Article Created: 24 March 1994
Article Reviewed/Updated: 27 February 1995

TOPIC ----------

Upon installation of the Adjustable Keyboard software on my Power Macintosh, I get an error message stating "The software to be installed is older than software on this system. This installation is not allowed."

Is System Update 2.0.1 built into System 7.1.2?

DISCUSSION ----------

When installing the Adjustable Keyboard on a Power Macintosh, or a Macintosh with the System Update 2.0.1 or later installed, no additional software is necessary. Macintosh computers after the 660AV and 840AV support the Adjustable Keyboard out of the box.

The reason for this is that System Update 2.0.1 was included in the ROM beginning with the AV computers and it is therefore included in the ROM of the Power Macintosh computers. The Record extension is also no longer included as a separate extension since Sound Manager 3.0.1 includes its functionality.

Article Change History:
27 Feb 1995 - Reviewed for technical accuracy.
05 Aug 1994 - Noted that issue occurs with any Macintosh with the System Update 2.0.1 or later installed.

Power Macintosh: Sound Voice Capabilities (3/94)

Revised: 3/24/94
Security: Everyone

Power Macintosh: Sound "Voice" Capabilities (3/94)

==========

Article Created: 24 March 1994

TOPIC -----

I have a question about the sound capabilities of the Power Macintosh computers. Are they capable of playing more than four "voices"?

I have a professor at a music school and he wants to be able to play back a composition which has 6 to 8 "voices" in it. Is it a hardware constraint or is it software? He is using HyperCard 2.1 also. Would upgrading make a difference?

DISCUSSION -----

The Power Macintosh computers include Sound Manager 3.0 which supports multiple voice capability. They are capable of playing 6 to 8 voices should not be a problem with the Power Macintosh. Constraints to the number of voices would be in the speed of the hardware, the bit resolution, 8 or 16, and the sampling rate, from 22kHz to 48kHz.

HyperCard 2.2 supports sound better than HyperCard 2.1 and there is an XCMD from Jeff Iverson Software of Burnsville, Minn. that supports HyperCard 2.2 with Sound Manager 3.0 available. Another solution would be to record sounds into a QuickTime format which can have up to 99 soundtracks.

QuickTake 100: Power Macintosh Compatible (1/97)

==========

Article Created: 24 March 1994
Article Reviewed/Updated: 24 January 1997

TOPIC -----

Is the QuickTake 100 compatible with the Power Macintosh?

DISCUSSION -----

The current QuickTake 100 software shipping with the QuickTake 100 camera (M1644LL/B) is compatible with the Power Macintosh computers. However, if your QuickTake 100 model number is M1644LL/A, then you need to obtain an update disk for the Power Macintosh. The QuickTake for PwrMac v1.0 disk is used in conjunction with the two QuickTake disks you received with your camera. The additional software disk is available from online services.

These articles can help you locate the software update mentioned here:

• "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
21 Jan 1997 - Updated to include software title.
27 May 1996 - Updated for technical accuracy.
02 Aug 1994 - Clarified what is needed to use the camera

Personal LaserWriter LS: Needs Updated Driver for AV's (10/95)

Revised: 10/30/95
Security: Everyone

Personal LaserWriter LS: Needs Updated Driver for AV's (10/95)

==========

Article Created: 24 March 1994
Article Reviewed/Updated: 30 October 1995

TOPIC ----------

My Personal LaserWriter LS won't print properly when connected to any AV Macintosh Computer. It prints one page then gives a time out error and tells me to check the serial cable. How can I fix this?

DISCUSSION ----------

Use the newer version of the driver for the Personal LaserWriter LS named 'LaserWriter 300' v1.2. Using this driver allows printing from the AV Series Macintosh computers. This software originally shipped with the AV Macintosh computers and is included in System 7.5.x.

Article Change History:
30 Oct 1995 - Updated driver availability in System 7.5.

Power Macintosh: User Removal of PDS Card Not Allowed (3/94)

==========

Article Created: 24 March 1994

TOPIC ----------

Can the Power Macintosh VRAM Expansion Card or Power Macintosh AV Card be removed by the end user of the computer?

DISCUSSION ----------

No, due to the risk of damage to the logic board or the card itself during the removal process, the VRAM Expansion Card or the AV Card must not be removed by the user. The computer should be serviced by an Apple authorized service technician only.

The Power Macintosh 7100/66 and Power Macintosh 8100/80 have the VRAM Expansion Card installed in the PDS connector, while the AV models have the AV card installed. In both cases, the card MUST remain installed to properly terminate the PDS bus.

Removal of the card or operating the computer with the PDS card removed can result in damage to the logic board of the Power Macintosh.

Installation of a NuBus card can be performed by the user, provided they follow the instructions for installation in the "Power Macintosh Getting Started" manual.

Power Macintosh 8100: Description of Dual SCSI Channels (1/95)

Revised: 1/19/95
Security: Everyone

Power Macintosh 8100: Description of Dual SCSI Channels (1/95)

==========

Article Created: 24 March 1994
Article Reviewed/Updated: 09 January 1995

TOPIC

This article discusses the two SCSI channels present within the Power Macintosh 8100 series.

DISCUSSION

The Power Macintosh 8100 series computer has a dual channel SCSI bus, there are two physical connectors on the logic board. The first SCSI channel supports only the internal hard drive.

The second channel supports any additional internal or external SCSI devices. The two SCSI busses are independent of each other, both have their own SCSI controller chip.

As with other Macintosh computers, the SCSI bus must be terminated at both ends. The first channel is terminated by the internal hard drive and the logic board.

Termination for the second channel is a bit more complicated. For CD ROM equipped 8100's, the cable for the CD has an additional SCSI connector, and a terminator on it similar to that on the Quadra 900/950.

If the unit does not have an internal CD ROM drive, termination is provided by the logic board. Any external device must also be terminated completing the necessary termination at both ends of the SCSI bus.

The faster processing rates and tighter tolerances of the Power Macintosh require using cables and terminators with the correct impedance. We strongly recommend using Apple cables and terminators or third party equivalents which meet Apple standards.

Article Change History:

09 Jan 1995 - Updated product name to relate article to all Power Macintosh
8100 models.
08 Apr 1994 - Clarified first SCSI channels' capabilities.

ARA and X.25: MultiPort Server X.25 - Description (6/95)

Revised: 6/8/95
Security: Everyone

ARA and X.25: MultiPort Server X.25 - Description (6/95)

==========

Article Created: 22 March 1994
Article Reviewed/Updated: 8 June 1995

TOPIC ----------

This article describes the X.25 connection for Apple Remote Access.

DISCUSSION ----------

The X.25 Network Extension Kit for the Apple Remote Access MultiPort Server allows users to connect from Apple Remote Access clients to Apple Remote Access MultiPort Servers through both public and private X.25 telephone networks.

X.25 networks allow dial-in users to call a local phone number to access a remote connection. This allows users to access local-area networks remotely while only being charged for local phone connection rates, therefore, companies with large, mobile work forces can use X.25 networks to reduce phone charges.

X.25 Provides:

- Connection to an X.25 network
- No need for modems on the Multiport Server
- Maximum of eight X.25 ports on a single Serial NuBus card (practical limit could be much less)
- X.25 support to any number of clients (each client must have the ARA Client application installed)

What You Need to Set Up an X.25 ARA Connection

- Apple Remote Access MultiPort Server which includes:
  - one serial number
  - one Apple Serial NuBus Card
  - one Apple RS-232 C Cable
  - four client software packages

- Apple MacX25 which requires:

- one or more serial cards, and V.35 or RS-232-C cabling
- Apple Part Number: M0711Z/E
- MacX25 supports up to 64 virtual circuits and operates at up to 64 Kbps with the V.35 cable

You do need to subscribe to and pay all fees for the X.25 network to which you connect.

- Apple Remote Access X.25 Extension which includes:
  - X.25 Server software which is installed on the MP server
  - X.25 Clients software which is installed on all ARA Client Macintosh Computers (NOTE: it is not necessary for clients to install the MacX25 user software)

  X.25 Extension Package does not provide any additional Client packages. Four Client packages are provided with the Apple Remote Access MultiPort Server.

Information Users Need to Access the X.25 Server

- the name of the network to which the X.25 server is connected (CompuServe, InfoNet, SprintNet, Tymnet inbound/outbound, or Vanilla X.28)
- The X.25 network address of the server
- their X.25 user id, if needed
- their X.25 user password, if needed
- whether reverse charging or local charging is permitted
- any other connection details

Clients will use the Options button in the Remote Access Connection window to indicate an X.25 connection. The Apple Remote Access Client User's Guide also provides instructions on connecting to an X.25 network.

Availability and Pricing

Apple's X.25 Network Extension Kit is available now through authorized Apple resellers at an Apple Price of $199 in the U.S.

MacX25 is available through resellers at an Apple Price of $599 in the U.S.

To find a nearby Apple dealer or reseller in the U.S., call 1-800-538-9696. For information about product support outside the U.S., contact the local Apple subsidiary or distributor. Prices and configurations may vary outside the U.S. For more information on any Apple Remote Access products, call the Apple Network Information Line at (408) 862-3385.

A/UX 3.0: Quadra 950 Serial Port Problem (3/94)

Revised: 3/24/94
Security: Everyone

A/UX 3.0: Quadra 950 Serial Port Problem (3/94)

==========

Article Created: 15 March 1994

TOPIC -----

The serial port, and sometimes the Quadra, freezes up when I use lp, then cancel the spooled job.

DISCUSSION -----

The Quadra 950 running A/UX 3.0 using the System V spooler (lp) to a serial printer has the same problem that the Macintosh IIfx had running A/UX 2.0.

As with the Macintosh IIfx, you must use the Serial Switch (1.1) set to compatible mode to succesfully use the System V spooler on the Quadra.

SNA•ps to IBM 5494 Configuration Parameters (3/94)

Revised: 3/25/94
Security: Everyone

SNA•ps to IBM 5494 Configuration Parameters (3/94)

==========

Article Created: 24 March 1994

TOPIC ----------

The information below shows how the SNA•ps Gateway configuration parameters should correlate with the IBM AS/400 and 5494 Remote Control Unit.

DISCUSSION ----------

SNA•ps Line Configuration

Line Name:	TRLINE
Line Type:	Token Ring
	All timers at default
Max I-Field Length:	2057

SNA•ps Partner Configuration

Partner Name:	AS400
Network Name:	AS400 - AS/400 Local control point name
Network Qualifier:	APPN - AS/400 Local network ID
Gateway XID:	05000000 - Does not correspond to anything in the 5494 connection
Partner XID:	07300000 - Must be this value for 5494 connection
Link Address:	400000005494 - Token ring address of 5494
Node Type:	Peer

SNA•ps Local LU

Local LU:	PASSTHRU - This is the Apple default
LU ID:	2 - Must be unique ID
Max TPs:	32 - IBM limit.
Network Name:	MACLU01 - AS/400 Device remote location name
Network Qualifier:	APPN - AS/400 Remote network ID

SNA•ps TP

TP Name: * - Allows all transaction programs
All other parameters at default. See SNA•ps Gateway Configuration Guide.

SNA•ps Remote LU

Remote LU: AS400 - This is the Apple default
Network Name: AS400 - AS/400 Device local location name
Network Qualifier: APPN - AS/400 Local network ID
Parallel Sessions: Supported

SNA•ps Mode

Mode Name: Must match the mode name created on the AS/400. See Gateway Config Guide. You cannot use the QPCSUPP mode.

There are some peculiarities with the 5494. It will not support more than 32 parallel workstation sessions per LU. Also, IBM recommends that the *APPC controller remote control point name match the 5494 controller remote location name. We believe this is to avoid confusion over the device description that is auto configured for the 5494. Apple support reps cannot assist in the setup or configuration of the IBM 5494. Refer to the IBM Redbook on configuring the 5494 to AS/400 (IBM P/N GG24-3828-00).

X.25 Extension: Error in Port Configuration (3/94)

Revised: 3/24/94
Security: Everyone

X.25 Extension: Error in Port Configuration (3/94)

==========

Article Created: 24 Mar 1994

TOPIC -----

I'm getting an error in the port configuration for the X.25 port on my ARA MultiPort server with the X.25 extension installed.

DISCUSSION -----

You should check the following:

- Verify that the MacX25 Admin program is running, and has started the MacX25 server assigned to the port's serial card.
- If necessary, start the MacX25 Admin and server programs, and then try again to turn on the port
- If the Apple Remote Access MultiPort Server starts up automatically from the Startup Items folder, verify that the MacX25 program is also set for automatic startup, and that it starts up before the MultiPort Server program. In addition, make sure the at you have selected the "Auto Start" option for the MacX25 server in MacX25 Admin's Server Info dialog box.
- If MacX25 is running, and you still get errors when turning on X.25 ports, then check the server log for additional information. If the log indicates that the port's serial card is in use by the Modem Service, use the Remote Access Manager to turn off the modem ports, and then try to turn on the X.25 ports again. You can't have modem ports and X.25 ports active on the same serial card.

X.25: Number of Serial Ports on a Serial NB Card (3/94)

Revised: 3/24/94
Security: Everyone

X.25: Number of Serial Ports on a Serial NB Card (3/94)

==========

Article Created: 24 Mar 1994

TOPIC ----------

How many ports can I configure on my Apple Remote Access Multiport Server when using MacX25 and the X.25 Extension?

DISCUSSION ----------

You can configure a maximum of eight ports per card, however, the practical limit may be lower. The limit varies directly with the X.25 link speed for your network (usually measured in kilobits per second, or Kbits/sec.) and inversely with the speed of the connecting modems (usually measured as bits per second, or bps).

If your X.25 link is shared by other services in addition to Apple Remote Access, the actual limits may be even lower. In general, X.25 performance will always be somewhat lower with X.25 than with a modem-to-modem connection.

The following table gives you an idea of possible variations for the maximum practical ports per serial card:

	9.6Kbits/sec link speed	19.2 Kbits/sec link speed	56/64 Kbits/sec link speed
all client modems 2400 bps	3 ports per card	6 ports per card	8 ports per card
half 2400 half 9600 bps modems	1 port per card	2 ports per card	6 ports per card
all 9600 bps modems	1 port per card	2 ports per card	4 ports per card

LaserWriter Pro 810: Password not Accepted (3/94)

Revised: 3/24/94
Security: Everyone

LaserWriter Pro 810: Password not Accepted (3/94)

==========

Article Created: 23 March 1994

TOPIC ----------

This article describes what to do if you cannot log into the "super user account" on the LaserWriter Pro 810.

DISCUSSION ----------

If a VT series terminal is connected to the maintenance port on the LW Pro 810, and you are unable to login to the "super user" account by typing the password "system," the following is a solution:

1) Hit the "F3" key on the terminal (this should put the terminal into setup mode)
2) Go to "General" setup
3) Under this area you should see "New Line" on the end of the third row
4) Change this entry to "No New Line" and retry the password

The problem stems from the fact that the printer is expecting "system" as a password and with the terminal set to "New Line" the VT is sending "system•" where the "•" is a carriage return; hence the printer thinks the password is wrong and displays the password> prompt again.

Quadra 610 DOS Compatible: Image not centered (3/94)

Revised: 9/29/95
Security: Everyone

Quadra 610 DOS Compatible: Image not centered (3/94)

==========

Article Created: 24 March 1994
Article Reviewed/Updated: 28 September 1995

TOPIC ----------

I have an NEC 15-in monitor attached to my Quadra 610 DOS Compatible. When I switch to the DOS side, the image is off-center. If I adjust it to center, then enter Windows, it's off center again and I have to re-adjust it. The monitor works fine in the Mac environment. What's wrong?

DISCUSSION ----------

The off center problem is caused by the different scan rate used by the graphics subsystem when in DOS as opposed to Windows. Basically it's in "graphics" mode when in Windows, and "text" mode when in DOS. Most of the newer multisync monitors have a way to center the picture in each environment and then save the settings. This is not specific to the Quadra 610 DOS Compatible computer or the DOS Compatibility Card. This is more a function of the way the monitor syncs to an incoming signal. The phenomena happens all the time in the DOS world, which is why the monitor manufacturers came up with monitors that had settings you could save.

MS-DOS itself uses no video drivers, so none are provided. The DOS Compatibility Card and the Quadra 610 DOS Compatible come with the Chips & Technologies (C&T) video drivers for the graphics chip the DOS Compatibility Card uses (C&T 450). The drivers disks are labelled "Display Drivers Disk 1" and "Display Drivers Disk 2".

Installing the C&T 450 drivers in Windows is going to be the best solution Apple can provide. Any additional adustments are up to the "adjustability" of the monitor.

Portable StyleWriter: Pitch Button Not Used (3/94)

Revised: 3/25/94
Security: Everyone

Portable StyleWriter: Pitch Button Not Used (3/94)

==========

Article Created: 24 March 1994

TOPIC ----------

The pitch button is not mentioned in the manual, how do I use it?

DISCUSSION ----------

The pitch button is not used on the Portable StyleWriter, so it is not covered in the manual.

StyleWriter II: Software Install Error (8/94)

Revised: 8/31/94
Security: Everyone

StyleWriter II: Software Install Error (8/94)

==========

Article Created: 24 March 1994
Article Reviewe/Updated: 30 August 1994

TOPIC ----------

I'm trying to install StyleWriter II software from our original StyleWriter II disks on a Power Macintosh 7100/66. I'm getting the following error when doing an Easy Install:

"The selected disk has System 7 installed, the custom installation you have selected is only for disks where System 6 is installed. Please click Switch Disk to choose a different disk or insert a floppy disk."

DISCUSSION ----------

We were able to duplicate this problem, and most likely the original StyleWriter II Installer script wasn't aware of the new Power Macintosh computers or new system software. This issue can also arise on any computer introduced after the StyleWriter II such as the PowerBook 500 series and 280/280c.

The latest StyleWriter II software (version 1.2) is on the Power Macintosh Install disks, and is part of the Easy Install for the Power Macintosh as well as being pre-installed on the PowerBook computers.

You might want to do a Custom Install, so that the additional fonts are installed on your Power Macintosh. The fonts are the only things that you need to install from the StyleWriter II software disks.

Article Change History:
30 Aug 1994 - Revised to show that issue can arise on any computer introduced after the StyleWriter II.
17 May 1994 - Included custom install information.

Universal Power Supply (UPS) and Retrospect (3/94)

Revised: 3/28/94
Security: Everyone

Universal Power Supply (UPS) and Retrospect (3/94)

==========

Article Created: 28 March 1994

TOPIC ----------

I am having problems with my UPS and Retrospect on my AWS 95.

DISCUSSION ----------

Retrospect does some sort of script verification and notification at quitting time, and this can cause problems with quitting Retrospect and a UPS. These Retrospect notifications require user input, and if no one is at the machine to answer this dialog box, the computer never shuts down and a dirty file system occurs when power is cut off.

The solution is to uncheck the "Check Validity of Next Script" option in Retrospect. To get to this option, click on the Configure icon in the Retrospect Directory, click on the "Options" button, then click on "Quit Action" in the Program Options window. There you should see "Check Validity of Next Script." Retrospect will now quit without stopping for user input.

Another option in "Quit Action" is "Rewind Tapes." This will rewind any accessed tape to the beginnings. The purpose of this is to speed future access to Retrospect. This option should also be off for machines on a UPS. The UPS may not be able to keep the computer up long enough to finish rewinding the tape.

Note: These tips can also be applied to AWS60/80.

Network Software Installer 1.4.3: Contents & ReadMe (3/94)

Revised: 3/28/94
Security: Everyone

Network Software Installer 1.4.3: Contents & ReadMe (3/94)

==========

Article Created: 28 March 1994

TOPIC --------------------

This article lists the software components for the Network Software Installer (NSI) 1.4.3.

DISCUSSION --------------------

This installer works on either System 6.0.5 or later, or System 7 Macintosh computers. You can use this Network Software Installer to install the following networking products:

Product	Version	Notes
AppleTalk version	58.1.2	
Network Control Panel	3.0.2	
AppleTalk Internet Router	2.0	requires router installation disk
Ethernet driver	6.0.5	for the Apple EtherTalk NB Card
EtherTalk	2.5.6	
Ethernet driver	1.1.1	for the Apple Ethernet NB Card, Twisted-Pair Card, for the Apple Ethernet LC Card, the Macintosh Quadra 700/900/950/800, Centris 610/650, built-in Ethernet port. Apple Ethernet LC Twisted-Pair Card, for the Apple Ethernet CS Twisted-Pair/Coaxial/AAUI Card
Ethernet driver	1.0.1	for the Macintosh Quadra 840AV and Centris 660AV
TokenTalk	2.5.6	
Token Ring Control Panel	1.0.1	
Token Ring driver	2.5.2	for the TokenTalk NB and Token Ring 4/16 Cards

In addition, this Installer installs the following related products:

A/ROSE 1.2.1

NOTE:
=====

On Macintosh computers with a 68040 microprocessor (Quadra, Centris, and Performa 470 series), some programs may quit unexpectedly or cause the computer to freeze when you attempt to open them over the network. This problem is fixed by using the Network Launch Fix available from AppleLink or the InterNet (ftp.apple.com).

Restrictions:
=============

This software should not be installed with AppleTalk Internet Router and AppleShare client on a Macintosh with only 1 Megabyte of memory.

If this release of the Network Software Installer is being used in conjunction with an Apple Internet Router v. 3.0 Installer, Router 3.0 MUST be installed first. This will ensure that the Router installation does not overwrite the newer AppleTalk software contained on NSI 1.4.2.

Release notes for each item follows:

AppleTalk version 58.1.2
========================
A problem existed with the LocalTalk SNMP byte counting code that would cause an occasional bus error. We were wrongly assuming that we ALWAYS had a WDS pointer and looking at that address to calculate the byte counts.

Now we check for Slotless networking devices when coming out of sleep for the PowerBook Duos.

Lap Manager only intercepts packets for SAP 0xAA or 0x00. We will attempt to deliver any packet for a destination SAP that is not 0xAA or 0x00 to the SAP listener. If no SAP listener is found, then the packet will be ignored.

Add check in LLCAttach for duplicate SAP or SNAP addresses. If so, then an error is returned.

Ethernet driver version 1.1.1 for the Apple Ethernet NB Card
==
Ethernet driver version 1.1 now allows the SONIC to transmit packets by building chains "on the fly". This results in a faster Ethernet driver.

This card no longer uses A/ROSE, but runs in "slave" mode. It now uses the same Ethernet driver that the Ethernet NB Twisted-Pair card uses.

Better allocation of memory when Virtual Memory is on.

Ethernet driver version 1.1.1 for the Apple Ethernet NB Twisted-Pair and LC

Cards
==========
Ethernet driver version 1.1 now allows the SONIC to transmit packets by building chains "on the fly". This results in a faster Ethernet driver.

Better allocation of memory when Virtual Memory is on.

Note: The faster Ethernet driver will only speed up Apple's LC Cards and not Third Party LC Cards.

Fixed a problem where the cpu could possible "hang" when the card was selected.

Ethernet driver version 1.1.1 for the Macintosh Quadra 700/900/950/800, Centris 610/650, built-in Ethernet ports.
==========
Ethernet driver version 1.1 now allows the SONIC to transmit packets by building chains "on the fly". This results in a faster Ethernet driver.

QuickTime on a Quadra 800, Centris 610 or a Centris 650 has much better performance.

Better allocation of memory when Virtual Memory is on.

Ethernet driver version 1.1.1 for the Apple Ethernet LC Twisted-Pair Card
==========
The Apple Ethernet NB LC Twisted-Pair Card is now supported.

Fixed a problem where the cpu could possible "hang" when the card was selected.

Ethernet driver version 1.1.1 for the Apple Ethernet CS Twisted-Pair/Coaxial/AAUI Card
==========
The Apple Ethernet CS Twisted-Pair/Coaxial/AAUI Cards are now supported.

EtherTalk for EtherTalk NB
==========
Internal build process has changed, but no changes to the driver code except the version number.

EtherTalk and TokenTalk version 2.5.6
==========
Fixed a multinode occasional crashing problem where packets were being sent to a node that was in the middle of being acquired.

A/ROSE 1.2.1
==========
Added support for Power Macintosh Systems.

AV Systems: How To Adjust Auto Video Gain (12/94)

Revised: 12/2/94
Security: Everyone

AV Systems: How To Adjust Auto Video Gain (12/94)

==========

Article Created: 30 March 1994
Article Reviewed/Updated: 2 December 1994

TOPIC ----------

We would like to utilize the AV technology in the Quadra or Power Macintosh computers, but we understand it has an auto-gain feature that cannot be turned off via software, or at least in the Quadra 840AV.

There are some indications that the auto-gain feature in the Power Macintosh may be turned off under software control and the gain adjusted manually. How can this be done?

DISCUSSION ----------

The Fusion Recorder utility program that comes bundled with the Macintosh Quadra 840AV and the Power Macintosh AV models doesn't support video gain (black level or white level), or contrast control. If you purchase VideoFusion software from VideoFusion, Inc., you will have the ability of adjusting the contrast control on only the Power Macintosh AV models.

There are third-party companys that provide hardware like the Radius' Video Vision or SuperMac's Video Spigot for greater video control on the Quadra 840AV.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

Article Change History:
15 Nov 1994 - Corrected contrast control with VideoFusion software.

Hypercard XCMD for Comm Toolbox & Geoport (3/94)

Revised: 3/29/94
Security: Everyone

Hypercard XCMD for Comm Toolbox & Geoport (3/94)

==========

Article Created: 29 March 1994

TOPIC ----------

I have built a customer HyperCard stack that will greet visitors, but I need the system to automatically dial from HyperCard using the GeoPort. I then need the system to detect a dial tone when the call is completed, and do an automatic hang-up and continue with the next process.

Is anyone aware of an XCMD that will provide this feature? OR, is there a HyperCard script that you are aware of that will provide this feature?

DISCUSSION ----------

There are a couple of companies that have supplied XCMDs for HyperCard that utilize the Apple Communications Toolbox which in turn communicates with the GeoPort. They are:

- Full Moon Software, Inc. PO Box 700237, San Jose, CA 95170 408 253-7199 or 408 252-2378 (fax).

- Pacer Software, Inc. 7911 Hershel Ave, La Jolla, CA 92037 619 454-0565 800-722-3702 or 619-454-6267 (fax).

- Mitem Corporation, 2105 Hamilton Ave., San Jose, CA 95125 408 559-8801 MitemView 3.2 is a complete client/server communications framework for $7000.

Another way to solve the problem would be to use AppleScript within HyperCard 2.2 to communicate with an AppleScript-aware communications application such as:

- PhonePro from Cypress Research Corporation, 240 East Caribbean Drive, Sunnyvale, CA 94089 408 752-2700.

- SITcomm 1.0 from Aladdin Systems, 165 Westridge Drive, Watsonville, CA 95076 408-761-6200

Power Macintosh and MacX (11/95)

Revised: 11/9/95
Security: Everyone

Power Macintosh and MacX (11/95)

==========

Article Created: 28 March 1994
Article Reviewed/Updated: 9 November 1995

TOPIC ----------

I'm trying to run MacX on a Power Macintosh 8100/80AV, and I'm not having any success. Is there a known problem with running MacX on a Power Macintosh? I'm running MacX version 1.2, is there a newer version I should use? I get an error saying something about the Comm tolls not loading properly.

DISCUSSION ----------

In order for Power Macintosh to properly work with MacX 1.2, you have to use MacTCP 2.0.4 or later. We have verified that MacTCP CDEV (1.1.1) which originally came with MacX 1.2 does not work on Power Macintosh. However the MacTCP Tool 1.2 which came with MacX 1.2 is still valid to use. Also the latest version of MacX is MacX 1.5.

MacTCP can be purchased off the Retail Price List as part number:
M8113Z/A - TCP/IP Connection for Macintosh

Article Change History:
09 Nov 1995 - Added latest version of MacX.
08 Jul 1994 - Added part number for the TCP connection product.

Power Macintosh: Why SIMMs Must Be Installed In Pairs (1/95)

Revised: 1/19/95
Security: Everyone

Power Macintosh: Why SIMMs Must Be Installed In Pairs (1/95)

==========

Article Created: 29 March 1994
Article Reviewed/Updated: 09 January 1995

TOPIC ----------

My Centris 610 has one 16MB SIMM installed. I'd like to put that SIMM in my Power Macintosh 6100 but Apple tells me I can't. Why can't I use just one SIMM in my Power Macintosh?

DISCUSSION ----------

The Centris SIMM you have is the right kind for your Power Macintosh 6100, but you need a matching pair to do the upgrade. The Centris has a 32-bit wide memory system, and the SIMM is 32 bits wide, so a single SIMM is all you need to add memory. On the Power Macintosh 6100, though, we have a 64-bit wide memory system. This requires two matching SIMMs to perform an upgrade.

If you only install one SIMM, the machine still boots, but it will not use that memory because the full 64-bit wide memory isn't there. As to where the RAM goes, there are two SIMM connectors next to the power supply for the two SIMMs.

The same two SIMM installation requirement holds true for the Power Macintosh 7100 and the Power Macintosh 8100.

Article Change History:
09 Jan 1995 - Removed speed from Power Macintosh model numbers.

Power Macintosh: Explanation Of Naming Format (3/95)

Revised: 3/28/95
Security: Everyone

Power Macintosh: Explanation Of Naming Format (3/95)

==========

Article Created: 29 March 1994
Article Reviewed/Updated: 28 March 1995

TOPIC -----

Can you explain the format used for naming the Power Macintosh?

DISCUSSION -----

The naming of the Power Macintosh models utilizes the following format.

The first digit tells the form factor: 6xxx is the thin form factor as in the Quadra 610; 7xxx, the taller form as in the Quadra 650 (but the number derives from the Quadra 700); and 8xxx, the mini-tower form as in the Quadra 800.

The second digit indicates the generation of Power Macintosh computer.

The last two digits signify any particular market designation.

For example, the Workgroup Server 9150 uses the 9 series chassis (large tower), is among the first generation of Power Macintosh computer and the utilizes the server market designation of 50 in the name..

Finally, the digits following the slash indicate the chip's clock speed.

Power Mac Upgrade Card Not Switching To PowerPC Mode (10/96)

Revised: 10/2/96
Security: Everyone

Power Mac Upgrade Card Not Switching To PowerPC Mode (10/96)

==========

Article Created: 28 March 1994
Article Reviewed/Updated: 2 October 1996

TOPIC ----------

I cannot get the Power Macintosh Upgrade Card to come up in Power Macintosh mode.

DISCUSSION ----------

When the control panel has been switched to the correct mode, you must then Shut Down (from the Special menu) and power on the computer. A restart will not work because the computer's Application Specific Integrated Circuits (ASIC) do not get reset unless they are powered off. A hard reset (Control-Command-Power) will reset the ASICs, but you can also corrupt the System file by doing this.

In addition, resetting the PRAM (Option-Command-P-R) at startup will bring the system up in 68000 mode regardless of the setting.

System 7.5: Error Installing Printer Software (2/95)

Revised: 2/15/95
Security: Everyone

System 7.5: Error Installing Printer Software (2/95)

==========

Article Created: 1 April 1994
Article Reviewed/Updated: 15 February 1995

TOPIC ----------

We have a Power Macintosh 6100/60 and are getting the following error message when selecting Easy Install with the LaserWriter Select 300 disks:

"The selected disk has System 7 installed, the custom installation you have selected is only for disks where System 6 is installed. Please click Switch Disk to choose a different disk or insert a floppy disk".

DISCUSSION ----------

You will only receive this error performing an Easy Install, Custom installs are unaffected. Any computer with System 7.1.2 or System 7.5 installed can have this problem.

This problem also occurs with the StyleWriter II installation on the Power Macintosh computers. Basically, the LaserWriter Select 300 and StyleWriter II Installer scripts are not aware of the Power Macintosh computers and new system software.

The printer drivers for the LaserWriter 300 and StyleWriter II are installed as part of the normal Easy Install of both System 7.1.2 and System 7.5. You should use this printer software, and not try to install the printer software from the disks provided with your printer. If you used the Custom Install and did not include the printer software for your printer, use the Custom Install from the System software again to install the proper printer software.

To install the additional TrueType fonts included with your printer, use the Custom Install on the printer software disks. You should only install fonts from these disks. Do not install the printer software from these disks. This replaces your Chooser and PrinterShare with older versions.

Here is a summary of the related print drivers:

- LaserWriter 300 - Print driver for Personal LaserWriter 300, LaserWriter Select 300, and Personal LaserWriter LS printers.

- StyleWriter II - Print driver for the StyleWriter II, and StyleWriter I printers.

Article Change History:
15 Feb 1995 - Reviewed for technical accuracy, revised System 7.5 keyword.
06 Jan 1995 - Corrected method of installing software.
21 Nov 1994 - Added Custom will replace Chooser and PrinterShare.

Power Macintosh: VRAM Expansion Card Minimum Bit Depth (3/94)

==========

Article Created: 30 March 1994

TOPIC -----

My new Power Macintosh has the VRAM Expansion Card installed. When I connect my display to it the lowest bit depth I can select is 8 bit (256 colors/grays).

DISCUSSION -----

The Power Macintosh was determined to have sufficient processing power with the VRAM Expansion Card to support 256 colors/grays at similar speeds as lower bit depths. Thus the VRAM Expansion Card only supports 256, Thousands, and Millions as options.

The AV Card has the traditional set of color depths, from black and white up to Millions.

Power Macintosh: Removable Cartridge Drive Compatibility (8/94)

Revised: 3/23/95
Security: Everyone

Power Macintosh: Removable Cartridge Drive Compatibility (8/94)

==========

Article Created: 31 March 1994
Article Reviewed/Updated: 25 August 1994

TOPIC ----------

Will my removable cartridge drive (SyQuest) be compatible with a Power Macintosh?

DISCUSSION ----------

The Power Macintosh incorporates a new version of the SCSI Manager, version 4.3. In order for your SyQuest to be compatible, the software driver for the cartridge drive must be SCSI Manager 4.3 aware and also be able to recognize the Power Macintosh.

To verify compatibility with the Power Macintosh, you should contact the vendor of your cartridge drive or the vendor of the software driver itself.

It is possible for you to determine the likelihood of compatibility of your drive. Using SCSI Probe, you can check the revision of the drive. If the prefix is E, it is an older drive that did not support the full SCSI command set (SCAI a precursor to SCSI) and does not support disconnect/reconnect.

All other SyQuest drives built after 1990 should support the SCSI manager 4.3 commands. Cartridges from earlier drives should be readable in a newer drive as long as the drivers are up to date.

If the rev level is F2G or earlier as viewed from SCSI probe on a 44mb drive ONLY, the same compatibility issue would be present. Any drive after F2G (for example F2H) will work fine with a Power Macintosh. Verify that the driver from the drive vendor is SCSI Manager 4.3 compatible.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

DOS Compatibility Card: PC Control Panel Memory Dimmed (3/94)

Revised: 9/29/95
Security: Everyone

DOS Compatibility Card: PC Control Panel Memory Dimmed (3/94)

==========

Article Created: 30 March 1994
Article Reviewed/Updated: 28 September 1995

TOPIC ----------

The PC Control Panel on my Quadra 610 with the DOS Compatibility Card has the memory section dimmed. I could change the RAM amount in this control panel at one time. How can I make this section of the control panel active again?

DISCUSSION ----------

The DOS Compatibility Card for the Quadra 610 and Centris 610, comes with a 72 pin SIMM slot. When the unit is shipped there is not a SIMM in the slot. When the slot is empty, the DOS Compatibility card uses the RAM installed in the Macintosh. When it uses memory from the Macintosh, the PC control panel allows you to pick how much of memory the DOS Compatibility Card uses. However, if a 72 pin SIMM is added to the DOS Compatibility Card, memory is not shared so memory section of the PC control panel dims. Even with the memory section dimmed, it displays the word SIMM to let you know it is using a SIMM located on the DOS Compatibility Card.

DOS Compatibility Card: System Using Large Amount of RAM (9/95)

Revised: 9/29/95
Security: Everyone

DOS Compatibility Card: System Using Large Amount of RAM (9/95)

==========

Article Created: 29 March 1994
Article Reviewed/Updated: 28 September 1995

TOPIC ----------

In the About This Macintosh dialog box, the system software on my Quadra 610 with the DOS Compatibility Card is using over 5.5 MB. Before I started using the DOS Compatibility Card, my system software was only using 1.5 MB. Why is there an increase in the size of the system software?

DISCUSSION ----------

The DOS Compatibility Card comes with a 72-pin SIMM expansion slot. This SIMM slot ships without a SIMM installed. Without a SIMM installed, the Macintosh and the DOS Compatibility Card share the memory installed in the Macintosh. In the PC Setup control panel, the amount of RAM that is shared can be changed in the memory section. The default amount of shared memory is 4 MB. The shared amount of RAM shows up in the About This Macintosh dialog box as part of the System software memory amount.

The PC Setup control panel allows you to change the amount of shared RAM. This allows you to lower the system software usage, by decreasing the amount of RAM set aside for the DOS Compatibility Card. The PC Setup Control panel also has an ON and OFF switch. This allows you to turn off the DOS Compatibility Card and free up all the shared memory if you aren't going to use DOS. After turning off the PC Setup control panel and restarting, the amount of RAM used by the system software returns to the original amount, in this case 1.5 MB.

If a SIMM is installed on the DOS Compatibility Card, then there is no shared memory, so the system software remains at the original amount.

Power Macintosh: Don't Drag Copy System Enabler (2/95)

==========

Article Created: 28 March 1994
Article Reviewed/Updated: 27 February 1995

TOPIC -----

In the past, I could drag an enabler off of the Disk Tools disk to replace the enabler on the hard drive. With the new Power Macintosh computers this doesn't work anymore.

DISCUSSION -----

The Power Macintosh Enabler now joins the System & Finder as NOT being complete versions on the Disk Tools disk. As such, it also is not recommended to be dragged from the Disk Tools disk.

AWS 95: Hardware Upgrade Program (3/94)

Revised: 4/4/94
Security: Everyone

AWS 95: Hardware Upgrade Program (3/94)

==========

Article Created: 13 February 1994

TOPIC ----------

This article describes the hardware upgrade program for the Apple Workgroup Server 95 (AWS 95) which provides support for up to five hard drives.

DISCUSSION ----------

There is a new disk subsystem that provides support for up to five hard drives inside the AWS 95 enclosure (older configurations support two internal hard drives). The new disk subsystem will be included with the two new AWS 95 configurations. Existing AWS 95 customers can obtain the hardware upgrade (new hard drive bracket and new SCSI cable) from their local Apple Authorized Service Provider or Apple Reseller. An Apple Authorized Service Provider is required to install the new disk subsystem.

AWS 95: New A/UX 3.1 and AppleShare Pro 1.1 (5/96)

Revised: 5/24/96
Security: Everyone

AWS 95: New A/UX 3.1 and AppleShare Pro 1.1 (5/96)

==========

Article Created: 13 February 1994
Article Reviewed/Updated: 24 May 1996

TOPIC ----------

This article provides an overview of software improvements, install media, and upgrades available for recently purchased systems.

DISCUSSION ----------

Program Overview

Enhancements to the Apple Workgroup Server 95 (AWS 95) was announced on January 4, 1994. The AWS 95 system has been shipping since April, 1993 and these announcements represent the first improvements since the product's introduction. Apple is offering a software upgrade kit to existing AWS 95 users (customers who purchased an AWS 95 or bought a PDS Card Upgrade to Quadra 900/950) so they can take advantage of the new software. All AWS 95 and AWS 95 PDS Upgrade Kit customers are eligible to receive the software upgrade kit.

The AWS 95 system software was improved in several areas. The new software versions are:

NEW: A/UX 3.1 and AppleShare Pro 1.1

OLD: A/UX 3.0.2 and AppleShare Pro 1.0

Software Improvements

- AppleShare Pro file server performance improved an average of 40%

- TCP/IP and NFS software is now pre-installed on the AWS 95 hard drive

- Software bug fixes from the Tune-up Kit issued in September, 1993 have been included

- Support for Syquest Drives

- Support for Apple's new 2 GB hard drive

Installing the New Software

The software upgrade kit is available on CD-ROM. There is one CD which provides the A/UX and AppleShare Pro enhancements. The software upgrade includes just the incremental code needed to enhance your current system software and will take up an additional 10 MB on your hard drive. The CD installer will automatically upgrade the A/UX software first, then search for AppleShare Pro software. If AppleShare Pro is resident on the AWS 95, it will be upgraded to AppleShare Pro 1.1. If AppleShare Pro is not used on the AWS 95, the setup process will be complete. AppleShare Pro users and/or groups settings will be maintained through the software upgrade process.

Upgrade for Recently Purchased Systems

Users that purchase an Apple Workgroup Server 95 or Apple Workgroup Server 95 PDS Upgrade Kit between December 1, 1993 and October 1, 1994 will receive the upgrade kit for a nominal fee. There will be a $10 charge for shipping and handling.

Customers are required to prove that they purchased the Apple Workgroup Server 95 or Apple Workgroup Server 95 PDS Upgrade Kit between December 1, 1993 and October 1, 1994 to receive the upgrade kit for a nominal fee. Customers will mail in (or Fax) a copy of the appropriate proof of purchase to the Apple Order Center along with a completed fulfillment coupon. Coupons can be obtained by calling the Apple Order Center.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

Power Macintosh Upgrade Card and System 7 Pro (3/95)

Revised: 3/21/95
Security: Everyone

Power Macintosh Upgrade Card and System 7 Pro (3/95)

==========

Article Created: 1 April 1994
Article Reviewed/Updated: 21 March 1995

TOPIC ----------

I am getting the error "You cannot install PowerTalk software on a hard drive with no System Software" when trying to install System 7 Pro on my Quadra 800 with a Power Macintosh Upgrade Card installed.

The system works perfectly otherwise and I did a "Clean Install" of the system software.

DISCUSSION ----------

There is no way for the Apple Installer to sense the presence of the Power Macintosh Upgrade Card, unless it is the active processor. Therefore, the Power Macintosh Card Control Panel will never be installed with System Software unless selected via a custom install.

System 7 Pro
==========

Regarding System 7 Pro, a problem was discovered with the installer script on the PowerTalk For Power Macintosh (1.0.3) Install Me First disk, where it would not install properly on systems with Power Macintosh Upgrade Cards. This problem does not exist on the PowerTalk For Power Macintosh (1.0.2) Install Me First disk. Except for the installer script, the software contained within the 1.0.2 and 1.0.3 Install Me First disks is identical. Apple recommends that customers use the 1.0.2 PowerTalk Install Me First disk when installing PowerTalk on Power Macintosh and Power Macintosh Upgrade Card systems.

NOTE:

Install the System 7 Pro software prior to installing the Power Macintosh Upgrade Card System Software.

The only "strange" thing that might happen after the install involves the Alert sound. After starting in 601 mode, the Alert sound only flashes the menu bar as though the volume is set to zero, but the Alert sound setting in the Sound control panel is set to normal. Changing the setting or the sound does not resolve the problem.

Check the Volumes setting for the built-in speaker to make sure it is not set to zero. Increasing this value brings the sound back. (This relationship is not discussed in the Power Macintosh Upgrade Card manual.)

System 7.5 PowerTalk

Regarding System 7.5 PowerTalk, there seems to be no restrictions on how it is installed. We installed base System 7.5 on a Centris 610 with a Power Macintosh Upgrade Card present, by selecting custom install to select the Power Macintosh Card Control Panel as well as software for any Macintosh. With that System 7.5, we could run either under the 68040 of the Centris or the 601 of the Power Macintosh Upgrade Card while installing PowerTalk successfully. In either case we got PowerTalk system software that would run on either the 68040 or 601 processor.

Article Change History:
21 Mar 1995 - Added System 7.5 information; clarified reason for error.

LaserWriter Pro 810: Installing on Alpha/Open VMS (5/94)

Revised: 5/3/94
Security: Everyone

LaserWriter Pro 810: Installing on Alpha/Open VMS (5/94)

==========

Article Created: 3 May 1994

TOPIC ----------

Is there a specific version of the LaserWriter Pro 810's VMS install program for OpenVMS? Also, do you have a file PRO810V1.SYS generated and compatible with OpenVMS?

DISCUSSION ----------

Currently, there is no version of the LaserWriter Pro 810 VMS install for OpenVMS. In terms of a file PRO810V1.SYS compatible with OpenVMS, we do not have one. This file is actually not needed as the "net load" feature of the LaserWriter Pro 810 is not utilized. All of the information needed to boot the printer is already in its ROMs.

You can get the LaserWriter Pro 810 to work with OpenVMS by bypassing the VMS install procedure and perform the following commands:

1) Run backup to unpack saveset in the same directory as it is in currently (generally this would be sys$common.[decserver] or [decserver.apple] if using mom$load).

2) Run psform.

3) Run applequeue (he will need last 6 digits of ethernet address and a unique LAT #).

For remote LAT admin:

1) Enter "mc ncp" at the vms prompt
2) Then "connect via 'svao' physic addr 'ethernet address'"
3) password= "access"
4) a "#" prompt indicates that a terminal session has been established with the printer.

To make changes in the printer's server card, get into the printer's RCF (remote console facility) and login in superuser mode ("su";password="system").

Apple OneScanner: Scan-in-progress LED Doesn't Function (4/94)

Revised: 4/5/94
Security: Everyone

Apple OneScanner: Scan-in-progress LED Doesn't Function (4/94)

==========

Article Created: 4 April 1994

TOPIC -----

In the Color OneScanner and OneScanner manual, it states that the scan–in–progress light comes on while scanner is scanning an image. My scan–in–progress light does not do this. Is the Scanner defective?

DISCUSSION -----

The scan-in-progress LED indicator only operated in early versions of the unit. The User's Manual was written and printed when the early units were available. Later when firmware enhancements were made, the functionality of the scan–in–progress LED ceased. The LED simply has no useful function on later versions of the scanner. However, this does not imply that the unit is defective.

Set MacSNMP Variables At The Console (4/94)

Revised: 4/5/94
Security: Everyone

Set MacSNMP Variables At The Console (4/94)

==========

Article Created: 4 April 1994

TOPIC ----------

I'm confused over how to set the variables in MacSNMP.

I've installed MacSNMP and I'm trying to change the protocol and destination variables. This is described in the MacSNMP Admin guide on page 25 which states, "You specify where SNMP traps are sent by setting the variables in the trapTable within the Macintosh System Agent. ... To enable a console to receive all the traps sent by a a Macintosh computer, you must set the following variables in the trapTable (defined in the Macintosh System MIB) to the values specified on the next page. This information is stored in the Preferences file." I'm using the MacSNMP Admin program and can find the variables but I can't change the content! After selecting the variable in question, protocol or destination, I can under the Option menu "Get value" or "Get info", but I have found no way to change or set the value. What am I missing?

DISCUSSION ----------

First, MacSNMP does not allow you to set any of the MIB variables.

Second, you're correct, the manual does indeed explain that in order to send traps you need to set the various associated variables within MacSNMP. The point that is not very clear is that these variables can only be set from the SNMP console and not from within MacSNMP. In the second paragraph on page 25 you'll see that it says, "To copy these MIBs to your console and set the variables, refer to the administrators guide that came with your console."

SNA•ps Gateway Config. To A Channel Attached 3174 (3/94)

Revised: 4/5/94
Security: Everyone

SNA•ps Gateway Config. To A Channel Attached 3174 (3/94)

==========

Article Created: 24 March 1994

TOPIC ----------

I am setting up a SNA•ps gateway on Token Ring at a user site. According to the user, the 3174 is connected by subchannel directly to the host and a Macintosh IIx (gateway computer) is on Token Ring connected to the 3174. The user gave me the address for the 3174. I went into SNA•ps Manager, set up a Token Ring config, put in the address: 400025400003, keeping display LU's as 1, and Printer LU's as 0, left the XID blank (what bother's me is on page 20 of the gateway manual it says you must enter the Exchange ID), and left the default Token Ring card address. I started the gateway, setup connection and tried to connect, and I immediately get a 510 comm error. I have two questions so I can be more knowledgeable with them.

1) Is it okay to leave the default Token Ring card address? The user says on his PC's he doesn't have to change it. If yes, where does the user get this ID, from Question 940 on the 3174 configuration?

2) Is the XID required? Again, if yes, where do I point the user to get this?

DISCUSSION ----------

1) Is it okay to leave the default Token Ring card address? Generally this is not the correct thing to do.

   The user says on his PC's he doesn't have to change it. Perhaps they are getting the client connection to a NetBios gateway mixed up with being the gateway. A NetBios connection to a 3270 IBM downstream gateway would use the Burned-in address. Kind of like using the burned-in Macintosh Ethernet address when running EtherTalk.

   If yes, where does the user get this ID, from Question 940 on the 3174 configuration? YES.

2) Is the XID required? Again, if yes, where do I point the user to get this? In this connection, a Downstream PU off a 3174, an XID is NOT used in the configuration. The SNA•ps engineers wrote the configurator for Token Ring requiring an XID always. Just enter 000-00000 and let it be. It is never sent to the host or the 3174.

It could be the user is not following IBM's suggestions about how to customize the 3174. IBM suggests using locally administered Token Ring addresses so you can change the physical Token Ring hardware, and not have to alter the customization of the 3174 each time. The user may have entered the "burned-in" addresses of specific cards into the 3174 customization, which is very time consuming.

This is how the connections work:

In the 3174, Question 900 is the Token Ring address of the 3174 (the one it is known as on the Ring). This is the Address you put in the SNA•ps config as the "gateway" Token Ring address.

A channel attached 3174 has a channel address and several sub-channel addresses. The first subchannel address is associated with the Coax ports on the 3174. The 2nd through 5th (however many) subchannel addresses are associated with downstream PUs, which are "3174" like controllers such as a SNA•ps gateway. The downstream controller is not located in the channel attached 3174 but on the Token Ring. The 3174 offers the service of doing a Link layer remapping of the Subchannel address to the proper Token Ring address. That is the function of question 940.

Subchannel 560 ----> TR 4000 0000 4444 0000
Subchannel 561 ----> TR 3E89 EEEE 8990 C667
And so on.

The host has a configuration in NCP for LU (displays and printers) associated with these subchannel addresses. When it "polls" the subchannel address, the 3174, passes the SNA request out it's Token Ring port to the Token Ring address shown in Question 940. The SNA•ps downstream PU gets connected by using a proper and configured Token Ring address from question 940.

If you do not use one of these configured addresses, you get a Comm 510, which means, "I passed my address to the 3174 and it did not match any of the values found in question 940, so I could not become an active downstream PU."

You have to use one of the configured addresses. Try to verify which PC is using one of the configured addresses. Make sure it is powered down, and us it's Token Ring address value (also shown in question 940) in the Macintosh Token Ring control Panel. Remind the user you are NOT changing the 3174, you are configuring the Macintosh to match up with their 3174 customization.

LaserWriter with Fax: Setting Fax Paper Tray (4/97)

Revised: 4/14/97
Security: Everyone

LaserWriter with Fax: Setting Fax Paper Tray (4/97)

==========

Article Created: 11 April 1994
Article Reviewed/Updated: 14 April 1997

TOPIC ----------

Is there a way to change the default paper tray the fax uses on the LaserWriter Select 360 or LaserWriter 16/600 PS printer?

DISCUSSION ----------

The PostScript code for setting the default paper tray can be used to set the default paper tray for incoming faxes on both the LaserWriter Select 360 and the LaserWriter 16/600 PS. The only disadvantage with this approach is that the user must manually select the desired paper tray from the print dialog box when printing from any other tray.

The following PostScript code changes the default paper tray to the 500-sheet tray. Use any word processor or TeachText to edit the code below and then save the file as a text document. Use the LaserWriter Utility to download the PostScript file to the printer.

If you decide to use the PostScript code below, you need to be very careful in selecting the default tray. If the multipurpose tray is set as the default and there is no paper in it, the paper out LED will light for EVERY PRINT JOB until paper is placed in the tray. This problem has caused some users (others on the network) to think that the printer is malfunctioning and needs to be repaired. Please forewarn users about this so they can understand, that the printer's behavior has changed.

Caution:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

This is PostScript Level 1 code:

```
%=========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin 2 setdefaultpapertray end
%
% end PostScript Code
%=========================================================
```

To change the default tray to another tray, simply change the number before the "setdefaultpapertray" operator to one of the following values.

Begin_Table

Value	Tray Selection
0	250 Sheet Cassette
1	Multi-purpose/manual feed tray
2	500 Sheet Cassette

End_Table

This is the equivalent PostScript Level 2 code:

```
%=========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=========================================================
```

This sets the paper tray priority to:
1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.
2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".
For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

Article Change History:
14 Apr 1997 - Added PostScript Level 2 code.
11 Dec 1995 - Changed distribution status.
23 May 1995 - Added section on notify others about default tray change.

System Update Disk v 3.0: How to Install (3/94)

Revised: 5/10/94
Security: Everyone

System Update Disk v 3.0: How to Install (3/94)

==========

Article Created: 30 March 1994

TOPIC -----

This article details the installation process for System Update Disk v 3.0

DISCUSSION -----

To install the 3.0 update, you need to do three tasks:

1. Install the System Update
2. Update your Apple Utilities
3. Update your Apple drivers

TASK 1—INSTALL THE SYSTEM UPDATE

The Easy Install process for System Update 3.0 automatically determines what elements if any, of the updated system software your computer needs.

To install the software update, follow these steps:

1. If you currently have the Connectix Enabler Patch on your hard disk, remove it from your hard disk before proceeding with this installation.

2. Insert System Update 3.0 Disk 1 in your floppy disk drive.

3. Double-click the Installer icon.

4. Read the Welcome screen, and then click OK.

5. Click the Install button.

The Easy Install process for System Update 3.0 automatically determines what elements of the updated system software your computer needs.

6. When you see a message that installation is complete, click the Restart

button.

7. When you finish, continue with “Step 2: Update Your Apple Utilities” below.

NOTE: None of the packages on System Update 3.0 are removable, so they will all be dimmed if you select “Custom Remove” in the pop-up menu.

TASK 2: UPDATE YOUR APPLE UTILITIES

The “Utilities ƒ” folder on the System Update 3.0 Disk 1 contains Apple HD SC Setup version 7.3.1 and Apple Disk First Aid version 7.2. These updates are intended to permanently replace the copies of Apple HD SC Setup and Apple Disk First Aid on your System 7.1, 7.1.1, or 7.1.2 Disk Tools disk. This update is recommended even if you have already installed System Update 2.0.1.

Follow these steps to update your utilities:

1. Insert the System Update 3.0 Disk 1 in your floppy disk drive.

2. Choose Eject Disk from the Special menu.

3. Insert the Disk Tools disk in your floppy disk drive.

4. Click the “Utilities ƒ” window to make it active.

5. Drag the HD SC Setup and the Disk First Aid icons to the Disk Tools disk.

6. When your Macintosh warns you that the files on your Disk Tools disk have the same names as the items that you are moving, click OK.

7. Insert specific disks as requested until the files are fully copied.

8. When you finish, continue with “Step 3: Update Your Apple Drivers” below.

TASK 3: UPDATE YOUR APPLE DRIVERS

System Update 3.0 also contains a driver update for Apple hard disk drives. You should install the driver update even if you have already installed System Update 2.0.1. Follow the steps below to install the driver update on each Apple hard disk drive you own:

1. With your computer off, insert the Disk Tools disk in your floppy drive.

2. Turn on your computer.

3. Double-click the Disk Tools icon.

4. Double-click the Disk First Aid icon in the Disk Tools window. (NOTE: If you completed “Step 2: Update Your Apple Utilities” above, the Disk First Aid utility on your Disk Tools disk should be version 7.2)

5. Click the driver icon that corresponds to your Apple hard disk drive. If you have more than one Apple hard disk drive, hold down the Shift key and click each icon for the drives that you will be updating.

6. Click the Repair button. Disk First Aid will now run some diagnostic tests and make any necessary repairs on your drive. This may take a few minutes depending on the size of your drive.

7. Open the File menu and choose Quit.

8. Double-click the Apple HD SC Setup icon in the Disk Tools window. (NOTE: For more information on Apple HD SC Setup, see your Macintosh user’s guide. If you completed “Step 2: Update Your Apple Utilities” above, the HD SC Setup utility on your Disk Tools disk should be version 7.3.1)

9. Click the Drive button until the name of the hard drive you want to update appears.

10. Click the Update button.

11. Repeat steps 9 and 10 for any other Apple hard disk drives you own.

12. Click the Quit button.

NETWORK INSTALLATION INSTRUCTIONS

Preparation

Users that wish to install System Update 3.0 on a number of Macintosh computers on a network may find it simpler to install System Update 3.0 over their network rather than shuffling the two 1.4 MB floppies on each Macintosh. Creation of the “net install” package can be accomplished by following these steps:

1. Create a folder on the server named “System Update 3.0 Net Install”.

2. Insert System Update 3.0 Disk 1 and drag the icon for the disk into the folder created in Step 1. This will copy the entire contents of the first disk into a folder within the “System Update 3.0 Net Install” folder.

3. Insert System Update 3.0 Disk 2 and drag the icon for the disk into the folder created in Step 1. This will copy the entire contents of the second disk into a folder within the “System Update 3.0 Net Install” folder.

4. Open the folder named “System Update 3.0 Net Install”.

5. Open the folder named “System Update 3.0 Disk 1” and drag the Installer and Install System Update into the folder named “System Update 3.0 Net Install”.

6. Verify that there are four icons showing in the “System Update 3.0 Net Install” folder. They should be the Installer, Install System Update, the “System Update 3.0 Disk 1” folder, and the “System Update 3.0 Disk 2” folder.

Installation

To install System Update 3.0 over a network, log onto the server containing the folder created above and double click the Installer. You can have multiple Macintosh computers installing from the same “System Update 3.0 Net Install” simultaneously. This should simplify, and speed up, the process for updating numerous networked Macintosh computers.

What Other Enhancements Does System Update 3.0 Provide?

System Update 3.0 includes enhancements from System Update 2.0.1, Hardware System Update 2.0, and Hardware System Update 1.0 (listed below). Some enhancements are Macintosh-model specific while others apply to a range of models.

- Improves the reliability of high-speed modems and similar devices connected to Macintosh LC, LC II, IIsi, IIvx, IIvi, Classic II, Quadra 900, and Quadra 950 computers.

- Improves the accuracy of the system clock in Macintosh LC, LC II, IIsi, IIvx, IIvi, Classic II, Quadra 900, and Quadra 950 computers.

- Corrects problems ejecting floppy disks when the computer is shut down on Macintosh IIsi, IIci, IIvx, IIvi, Macintosh Quadra 700, and Macintosh Quadra 950 computers.

- Addresses possible floppy disk drive and hard disk problems with the Macintosh IIsi, IIci, IIvx, IIvi, Centris, Quadra, and PowerBook and PowerBook Duo computers.

- Removes horizontal white lines that may appear while scrolling on Quadra and Centris systems with a Macintosh 16" Color Display.

- Prevents fonts from being needlessly locked in memory during the boot process. This frees up memory on affected machines.

- Corrects color problems with the Apple Basic Color monitor on Macintosh Centris and Quadra computers. (NOTE: If Hardware System Update 1.0, Hardware System Update 2.0, or System Update 2.0.1 extensions or the Basic Color Monitor extension are already installed on your computer, this update replaces them. The 3.0 update removes the Basic Color Monitor and the ADBReInit extensions and replaces them with a System Update 3.0 extension.)

- Adds software for the Apple Adjustable Keyboard, allowing you to connect the keyboard to any Macintosh computer without separately installing special keyboard software. This software is not needed by Power Macintoshes, but is needed by the Power Macintosh Upgrade Card.

- Updates the Macintosh Color Classic System Enabler (System Enabler 401, version 1.0.5). This new version allows the Apple IIe Card and software to be used with the Color Classic. In addition, this revised System Enabler improves mouse performance with the Color Classic. (NOTE: To use the Apple IIe Card with system software version 7.1 on a Color Classic, you need to have version 2.2.1 of the Apple IIe Card software. You can obtain an upgrade package for the Apple IIe Card software by contacting an Apple-authorized dealer, or by using the AppleLink path Apple Products: Apple SW Updates: Macintosh: Peripheral Software: Apple IIe Card for Macintosh LC.)

- Updates System Enabler 131 (version 1.0.3) for the PowerBook 160, 165, 165c, and 180 to support 12" monitors and improve reliability. (NOTE: There is a very small chance that your PowerBook may not boot when you turn it on for the first time after installing the update. If this happens, turn the computer off and back on, and press Command-Option-P-R while the computer starts up.) System Enabler 131 replaces System Enabler 121 and System Enabler 111 (and the Installer will delete these files).

- Installs the Sound Manager Update to improve sound performance on most Macintosh computers. (NOTE: When this software is installed, your system sound will revert to the Simple Beep. After installation, you may wish to reset the Sound control panel to your preferred sound.)

- Installs AutoRemounter 1.2. This release significantly reduces network traffic compared to version 1.0.

- Includes Disk First Aid 7.2, a utility that repairs damaged disks.

System Update Disk 3.0: Description (5/95)

==========

Article Created: 30 March 1994
Article Reviewed/Updated: 2 May 1995

TOPIC ----------

This article describes the System Update 3.0, its contents, the intended audience, and system requirements.System Update Disk v 3.0 is a set of software enhancements for any Macintosh computer running System 7.1, 7.1.1, or 7.1.2.

This update also applies to any Performa version of 7.1.

DISCUSSION ----------

System Update Disk v 3.0 ships in these configurations:

• The Standard Configuration ships ast wo 1.4 high density floppy disks

• A single 800K floppy configuration. This configuration provides the features of System Update Disk v 3.0 needed by machines that may not support FDHD floppies (the Macintosh Plus, SE and Macintosh II).

General Enhancements
==========

These general enhancements are for all Macintosh computers running 7.1 or later.

• Provides system-level improvements to increase overall system performance and reliability on most Macintosh models.

• Corrects a problem that allowed the system to become corrupted during a power failure or crash and prevented it from restarting.

• Prevents a PowerBook from trying to spin up its hard drive when the system is warning you that there is only 10 seconds of battery power remaining.

• Fixes the About This Macintosh box so the memory usage line doesn’t get drawn outside of its bounds.

• Provides a solution to prevent the file corruption that can happen when a file is being modified remotely (Remote Access or file server) and the connection is unexpectedly broken. Now, when the remote volume is lost, its icon remains dimmed on the desktop.

• Updates the Standard File package to include many fixes and enhancements. The most significant fix allows more than 20 volumes to be mounted, and the use of color icons.

• Provides increased reliability for remote file saving when the client is running System 7.1 or greater while the server is running a pre-7.0 System and using pre-3.0 AppleShare.

• Fixes a problem with throwing away folders which were on an AppleShare volume. Sometimes after attempting to empty the Trash the Finder would warn you that the folder contains items that are in use and could not be deleted. The Trash now properly handles folders from AppleShare volumes.

• Updates the Easy Access Control Panel to version 7.2, fixing a wake up problem on PowerBooks. It now remembers whether sticky keys, mouse keys, and slow keys were on or off between restarts.

• Includes SimpleText version 1.0, which replaces TeachText.

• Includes Apple HD SC Setup version 7.3.1

Who Should Install System Update Disk v 3.0?

Install this update only if you have Macintosh system software version 7.1, 7.1.1, or 7.1.2 installed on your computer. It is compatible with the Performa versions of 7.1.x.

If you have already installed the earlier updates, you should still install System Update 3.0 in order to have the latest version of all system software. System Update 3.0 provides additional functionality and fixes problems that the earlier updates did not address.

Systems bought after May, 1994 have the System Update Disk v 3.0 already installedon their system.

System Update Disk v 3.0 FDHD Contents and Detailed Changes

NOTE: 800K version only contains items marked with an asterisk (*)

DETAIL	MODELS AFFECTED
System Update ReadMe*	All

System Update 3.0 Extension*	All
SimpleText 1.0*	All
New Standard File Package*	All
Easy Access Control Panel 7.2*	All
Memory Control Panel 7.3*	All
Sound Manager 3.0 & Sound Control Panel 8.0.1*	All except AV machines & Quadra 605, 650
Apple Adjustable Keyboard resources* (The software components needed to use an Apple Adjustable Keyboard)	All except MacPlus
Grayshare serial driver patches* (Improves serial driver reliability; at higher speeds reduces interrupt latency)	All
HDSC Setup 7.3.1 (Ability to format large drives up to 4 GB)	All
Disk First Aid 7.2* (Improved interface and bug fixes)	All
The PowerBook Display Control Panel 1.1	All PowerBooks
The PowerBook Control Panel 7.3.1 (To simplify the user experience with the PowerBook, the functionality of the previous PowerBook control panel has been split between this control panel and the PowerBook Setup Control Panel 7.3 - also part of this release).	All PowerBooks
The PowerBook Setup Control Panel 7.3.1	All PowerBooks
The PowerBook Duo Enabler 1.0 (It fixes the ADB problems for PowerBook Duo machines.)	All Duos
Duo Battery Patch 1.0 (Fixes a problem with type II batteries in the PowerBook Duo Family Enabler 1.0.)	All Duos except the 270c
AutoRemounter 1.2 (This version greatly decreases the network traffic that the 1.0 release generated. A "crashing" bug on an SE at start up was also	All PowerBooks

fixed.)	
Battery DA 7.1.1	All PowerBooks
TV Setup Control Panel 1.0.1 (Support has been added for HRC cable systems. A problem was fixed that would sometimes cause the screen to darken after returning from TV mode.)	Macintosh TV
Screen Control Panel 1.0.4 (This version fixes a problem on LC 575 systems where a single PRAM location was serving two different and conflicting purposes.)	Macintosh LC 520, 550, 575, Color Classic, Color Classic II, and Macintosh TV
System Enabler 003 v1.1	LC III
System Enabler 040 v1.1 (Added support for Quadra 610 and 650.)	Quadra 800, 610, and 650; Centris 610 and 650
System Enabler 065 v1.2	Quadra 605, LC 475, and LC 575
System Enabler 088 v1.2 (Added support for Quadra 660AV.Increased File Manager performance and Resource Manager performance Corrects failure to print to the LW Select 310 printer. Improves network reliability.)	840AV, 660AV
System Enabler 131 v1.0.3 (Provides the latest software the Enabler dependent all in one Powerbook line.)	PowerBook 160, 165c, 180, and 180c
System Enabler 401 v1.0.5 (Fixes a problem of erratic mouse movement. The problem surfaces when using Double Exposure.)	Color Classic
System Enabler 403 v1.0.2	Color Classic II, LC 520, and LC 550
PowerPC Enabler 1.0.1	Power Mac 6100, 7100, and 8100
PowerPC Upgrade Card Enabler 1.0.1	Upgrade Card in: Centris 610, 650,Quadra 610, 650, 700, 800, 900, and 950
PC Setup Control Panel 1.0.2	Centris/Quadra

w/DOS Compatbility
Card

System Update 3.0: Disk Contents (4/94)

==========

Article Created: 30 March 1994

TOPIC --

This article describes the contents of the two FDHD disks that come with System Update Disk v 3.0, and the single 800K disk for the 800K version.

DISCUSSION --

System Update 3.0 Disk 1 contains:

- Installer and Installer script
- System Update 3.0 Read Me
- System Update 3.0 Archive
  This file is an InstaCompOne archive which contains the following files:
  - Battery (v 7.1.1)
  - System Update (v 3.0)
  - Record Button (v. 1.0, from Norsi)
  - Sound Manager (v. 3.0)
  - Duo Battery Patch (v 1.0)
  - Easy Access (v 7.2)
  - Memory (v 7.3)
  - Sound (v 8.0.1)
  - PowerBook Display (v. 1.1)
  - PowerBook (v. 7.3.1)
  - PowerBook Setup (v. 7.3.1)
  - AutoRemounter (v 1.2)
  - TV Setup (v 1.0.1)
  - PC Setup (v1.0.2)

System Resources in a folder named System Resources *f*:

- Keyboard Resources (v1.0.3)
- Serial Resources (for Grayshare)
- StandardFile Resources (v1.0)

Utility applications in a folder named Utilities *f*:

- Apple HD SC Setup (v 7.3.1)
- Disk First Aid (v 7.2)

System Update 3.0 Disk 2 contains:

System Enablers at the Root Level:
- System Enabler 131 (v1.0.3)
- System Enabler 401 (v1.0.5)
- System Enabler 088 (v1.2)
- PowerBook Duo Enabler (v1.0)
- System Enabler 403 (v1.0.2)
- System Enabler 065 (v1.2)
- System Enabler 003 (v1.1)
- System Enabler 040 (v1.1)
- PowerPC Enabler (v1.0.1)
- PowerPC Upgrade Card Enabler (v1.0.1)

System Update 3.0 (800K) contains:

Items at the root level:
- Installer and Installer script
- System Update 3.0 800K Read Me
- System Update 3.0 800K Archive

This file is a System Update archive which contains the following files:
   - System Update (v 3.0)
   - Record Button (v. 1.0)
   - Sound Manager (v. 3.0)
   - Easy Access (v 7.2)
   - Memory (v 7.3)
   - Sound (v 8.0.1)

System Resources in a folder named System Resources ƒ:
- Keyboard Resources (v1.0.3)
- Serial Resources (for Grayshare)
- StandardFile Resources (v1.0)

Utility applications in a folder named Utilities ƒ:
- Apple HD SC Setup (v 7.3.1)
- Disk First Aid (v 7.2)

Apple IIe Card: Can't Use Comm slot device With Card (9/96)

==========

Article Created: 6 April 1994
Article Reviewed/Updated: 17 September 1996

TOPIC ----------

Does the Apple IIe Card work with Macintosh computers that have a Comm Slot, such as the Macintosh LC 575?

DISCUSSION ----------

The Apple IIe Card does not work in multiple card environments. Because of this, the Apple IIe Card will not work when there is any device in the comm slot on the Macintosh LC 575.

This article was published in the 17 September 1996 issue of the Information Alley.

LaserWriter IIf/IIg: Communication Switch Settings (4/94)

Revised: 4/6/94
Security: Everyone

LaserWriter IIf/IIg: Communication Switch Settings (4/94)

==========

Article Created: 5 April 1994

TOPIC ----------

This article discribes the communication switch settings on the LaserWriter IIf and LaserWriter IIg printer.

Discussion----------

The LaserWriter IIg contains an ethernet port, the LaserWriter IIf does not, so when the chart indicates ethernet, it only applies to the LaserWriter IIg printer.

The following table shows the communication settings in effect when the printer is new. The push-button switch on the printer's connector panel can be set to positions 0-9. Switch positions 0-5 are fixed, and the settings for these positions cannot be changed. Positions 6-9 are user-configurable; you can change the settings for these positions to match the needs of the computer you are connecting. The section "Available Settings," at the end of this article, lists all the options available for each setting.

From a Macintosh computer, you use the LaserWriter Utility program to display and change communication settings. From a computer other than a Macintosh, you can send PostScript commands to the printer to change the communication settings.

Settings

Switch Number	Port Name	Connect Type	Baud Rate	Parity	Data Bits	Stop Bits	Flow Cntrl	Protocol	Mode
0	Din-8	LocalTalk	-	-	-	-	-	-	PS
	RS-232	Serial	9600	None	8	1	XON/XOFF	Normal	PS

	Ethrnet	EtherTalk	-	-	-	-	-	-	PS

PS - PostScript
HP - HP PCL 4
* - Nonprinting input: This is used when a device-such as an automatic sheet feeder-is connected to the serial port and receives special commands from a computer connected through another of the printer's ports.

Available Settings

The following table briefly describes the communication settings and lists the options available for each.

Setting	Description	Options

Baud Rate	The speed of transmission between the computer and printer.	300, 600, 1200, 1800, 2400, 3600, 4800, 7200, 9600, 19200, 57600
Parity	The method used to compare transmitted and received data to check for errors.	None, odd, even, mark, space
Data Bits	The number of bits used to represent each character.	7, 8
Stop Bits	The number of bits used to indicate the end of a character.	1, 2
Flow Control	The method used to prevent transmitted data from exceeding the rate at which the receiving end can accept it.	XON/XOFF, DTR ETX/ACK
Protocol	The digital format in which the data is presented.	Normal, Raw, Binary
Mode	The communication standard used to transmit data	Postscript, HP Printer Command Language 4, and Nonprinting Input (not intended for a computer connection)

Performa: At Ease Workgroup Version Message (2/97)

==========

Article Created: 5 April 1994
Article Reviewed/Updated: 11 February 1997

TOPIC ----------

Recently I began to get a message on my Performa 550 saying that I am now using the Workgroup version of At Ease. How do I resolve this as I am not using a Workgroup version?

DISCUSSION ----------

Here is to resolve what you are experiencing. Please be aware, the steps presented below are resolving an issue occurring on a stand-along computer. In other words, not a computer networked together in a workgroup.

To resolve this follow the steps below:

Step 1

Restart your Macintosh computer from your Utilities disk.

Step 2

Open the System Folder within the hard disk icon.

Step 3

Open the At Ease Items folder within the System Folder. Drag the following items to the Trash:
-At Ease Preferences
-At Ease Setups
-At Ease Users

Step 4

Once these items are in the Trash, hold down the Option key on your keyboard

while you choose Empty Trash from the Special menu.

Step 5

Restart the computer and you should be able to get into At Ease Setup without a problem.

If you still have problems after trying all of this, please call 800-SOS-APPL for additional assistance.

Article Change History:
11 Feb 1997 - Added that this is a stand-along computer.
14 Aug 1995 - Reformatted and added keyword.
17 Mar 1995 - Corrected wording of At Ease in title.

* - Nonprinting input: This is used when a device-such as an automatic
. sheet feeder-is connected to the serial port and
. receives special commands from a computer
. connected through another of the printer's ports.

Available Settings

The following table briefly describes the communication settings and lists the options available for each.

Setting	Description	Options
Baud Rate	The speed of transmission between the computer and printer.	300, 600, 1200, 1800, 2400, 3600, 4800, 7200, 9600, 19200, 57600
Parity	The method used to compare transmitted and received data to check for errors.	None, odd, even, mark, space
Data Bits	The number of bits used to represent each character.	7, 8
Stop Bits	The number of bits used to indicate the end of a character.	1, 2
Flow Control	The method used to prevent transmitted data from exceeding the rate at which the receiving end can accept it.	XON/XOFF, DTR ETX/ACK
Protocol	The digital format in which the data is presented.	Normal, Raw, Binary
Mode	The communication standard used to transmit data	Postscript, HP Printer Command Language 4, and Nonprinting Input (not intended for a computer connection)

Personal LaserWriter NTR: Communication Switch Settings (4/94)

Revised: 4/6/94
Security: Everyone

Personal LaserWriter NTR: Communication Switch Settings (4/94)

==========

Article Created: 5 April 1994

TOPIC ----------

This article describes the communication switch settings on the Personal LaserWriter NTR printer.

DISCUSSION ----------

WARNING: If you choose a non-LocalTalk setting for the LocalTalk (8-pin) port while the printer is connected to an AppleTalk network, you can do permanent damage to devices on the network! Settings 1, 4, 5, and 6, (and possibly 9, since you can customize 9) are non-LocalTalk settings for the 8-pin port. Before you choose one of these settings, disconnect any LocalTalk connector box connected to the printer.

If you have a non-Macintosh computer that requires special settings to work with the Personal LaserWriter NTR, you can choose a different group of settings. You use the ten-position push-button switch on the back of the printer to choose a group of setting.

If you need to change the setting, check the following table for the switch position that corresponds to the setting you need. If you need to additional settings and have access to a Macintosh computer, you can program position 9 using the LaserWriter Utility software.

Settings

Switch Number	Port Name	Connect Type	Baud Rate	Parity	Data Bits	Stop Bits	Flow Cntrl	Protocol	Mode
0	Din-8	LocalTalk	-	-	-	-	-	-	PS
	RS-232	Serial	9600	None	8	1	XON/XOFF	Normal	PS

	Parallel	Centronic	-	-	-	-	-	Normal	PS
1	Din-8	Serial	9600	None	7	1	XON/XOFF	-	PS
	RS-232	Serial	9600	None	7	1	XON/XOFF	Normal	PS
	Parallel	Centronic	-	-	-	-	-	Normal	PS
2	Din-8	LocalTalk	-	-	-	-	-	-	HP
	RS-232	Serial	9600	None	8	1	XON/XOFF	Normal	HP
	Parallel	Centronic	-	-	-	-	-	Normal	HP
3	Din-8	LocalTalk	-	-	-	-	-	-	HP
	RS-232	Serial	9600	None	8	1	DTR	Normal	HP
	Parallel	Centronic	-	-	-	-	-	Normal	HP
4	Din-8	Serial	1200	None	7	1	XON/XOFF	-	PS
	RS-232	Serial	1200	None	7	1	XON/XOFF	Normal	PS
	Parallel	Centronic	-	-	-	-	-	Normal	PS
5	Din-8	Serial	9600	None	8	1	XON/XOFF	Normal	PS
	RS-232	Serial	9600	None	8	1	XON/XOFF	Normal	PS
	Parallel	Centronic	-	-	-	-	-	Normal	PS
6	Din-8	Serial	9600	None	8	1	XON/XOFF	Binary	PS
	RS-232	Serial	9600	None	8	1	XON/XOFF	Binary	PS
	Parallel	Centronic	-	-	-	-	-	Binary	PS
7	Din-8	LocalTalk	-	-	-	-	-	-	PS
	RS-232	Serial	9600	None	8	1	XON/XOFF	Normal	PS
	Parallel	Centronic	-	-	-	-	-	Normal	PS
8	Din-8	LocalTalk	-	-	-	-	-	-	PS
	RS-232	Serial	9600	None	8	1	XON/XOFF	Normal	PS
	Parallel	Centronic	-	-	-	-	-	Normal	HP
9	Din-8	LocalTalk	-	-	-	-	-	-	PS
	RS-232	Serial	9600	None	8	1	XON/XOFF	Normal	PS
	Parallel	Centronic	-	-	-	-	-	Normal	PS

PS - PostScript
HP - HP PCL 4
* - Nonprinting input: This is used when a device-such as an automatic sheet feeder-is connected to the serial port and receives special commands from a computer connected through another of the printer's ports.

Available Settings

The following table briefly describes the communication settings and lists the options available for each.

Setting	Description	Options
Baud Rate	The speed of transmission between the computer and printer.	300, 600, 1200, 1800, 2400, 3600, 4800, 7200, 9600, 19200, 57600
Parity	The method used to compare transmitted and received data to check for errors.	None, odd, even, mark, space
Data Bits	The number of bits used to represent each character.	7, 8
Stop Bits	The number of bits used to indicate the end of a character.	1, 2
Flow Control	The method used to prevent transmitted data from exceeding the rate at which the receiving end can accept it.	XON/XOFF, DTR ETX/ACK
Protocol	The digital format in which the data is presented.	Normal, Raw, Binary
Mode	The communication standard used to transmit data	Postscript, HP Printer Command Language 4, and Nonprinting Input (not intended for a computer connection)

Revised: 4/6/94
Security: Everyone

Performa: Compton's CD Text Difficult To Read (4/94)

==========

Article Created: 5 April 1994

TOPIC -----

I'm having some problems with my Compton's CD, text is displayed in an Old English font which makes it difficult to read.

DISCUSSION -----

To resolve this issue, there are two font files you need to remove from your Fonts folder. The two font files are:

(1) Remove (DO NOT TRASH) any font relating to American Heritage Dictionary in the Fonts folder inside the System Folder.

(2) Remove (DO NOT TRASH) any font relating to Holiday font suitcase in the Fonts folder inside the System Folder.

Apparently, these two font families conflict with Compton's normal accessing of fonts.

Performa: Default Document Folder Selection (4/94)

==========

Article Created: 5 April 1994

TOPIC -----

I would like to know how to reverse the process of making the Document folder the default. I would like the default folder to be the current folder that is open. How do I change it?

DISCUSSION -----

The answer to this depends entirely on which version of the Performa operating system you have. I'll provide both answers for you.

If you have version 7.0.1p-7.1p2:

To prevent the computer from defaulting to the Documents folder you need to remove the Launcher Control Panel from the Control Panels folder within the system folder. The Launcher is what is causing your computer to default to the Documents folder. Even though the Launcher is removed from the system folder, you will still be able to use the Launcher to access your applications.

If you have version 7.1p3 or greater:

Open the Performa Control Panel. On this Control Panel there are several options, including an option to change what you want the default folder to be. Currently it is set to default to the Documents folder, but you can change this to default to the last folder used.

Revised: 4/6/94
Security: Everyone

Performa: Launcher Unable To Find Hard Drive (4/94)

==========

Article Created: 5 April 1994

TOPIC -----

Whenever I try to click on items in my Launcher it tells me that it cannot be opened because the disk "hard drive name" cannot be found. What should I do?

DISCUSSION -----

This is happening because the name of the hard drive has been changed from what it was originally. To fix this problem, you will just have to rename your hard drive back to its original name (Hard Disk or Macintosh HD).

You change the name of the hard drive in the same manner that you change the name of a folder. This process is described in detail in your User's Guide. Once you have renamed it back to its original name, the items in the Launcher should then work fine.

LW Pro 810: Change Virtual Printer Font (10/95)

Revised: 10/18/95
Security: Everyone

LW Pro 810: Change Virtual Printer Font (10/95)

==========

Article Created: 6 April 1994
Article Reviewed/Updated: 18 October 1995

TOPIC -----

We are using the ascii_portrait service on the LaserWriter Pro 810 and need to change the default font from 10pt Courier to 9pt Courier. How do we do this?

DISCUSSION -----

As of April 1994, there is no way to change font characteristics of virtual printers. In actuality, virtual printers send down HP PCL or PostScript code before each print job to configure the printer. You can add a couple of lines of PCL to your print queue configuration (on NOVELL, UNIX, VMS) to change the font size or pitch. This should make it transparent for anyone using the print queue since the code will be downloaded automatically before the actual job.

Here are the HP PCL commands to change font size and pitch:

<esc>(s#H : pitch selection (usually 10 or 16.66 built-in)
<esc>(s#V : character height (font size in points)

<esc> is the escape character
is the actual value

For example, to change font size to 9 point:

<esc>(s9V

GeoPort: Won't Answer Incoming Calls In Originate Mode (4/94)

==========

Article Created: 6 April 1994

TOPIC ----------

I want my GeoPort adapter to answer an incoming call in "originate" mode. It works with my external modems - that is I issue an "ATDT" command when the phone is ringing and the modem grabs the incoming call. With the GeoPort, I get a port in use error.

DISCUSSION ----------

With the Express Modem and GeoPort, there is a time delay of 6 seconds between when a ring is detected and when you can issue a an "ATDT" command. The way to eliminate this would be to type "ATH1DT" instead of "ATDT". The "H1" forces the modem to go off-hook. Once off-hook, the "DT" command can be issued causing the modem to think it is the originator.

Express Modem Dial Back & TrackNet (4/94)

Revised: 4/7/94
Security: Everyone

Express Modem Dial Back & TrackNet (4/94)

==========

Article Created: 7 April 1994

TOPIC -----

Our PowerBooks with Express Modems are not able to dial into our network using White Knight because of a problem with our TrackNet device and the Express Modem script. TrackNet is a security device used for dial-back and works fine with everything except Express Modems in PowerBooks.

In order to make connection using other modems, or another CPU with an external modem, the command ATDT* must be entered a few milliseconds after the dial-back ring is detected by the initiating CPU. When the ATDT* command is issued, the Express Modem returns "MODEM IN USE," however, other modems do not do this.

DISCUSSION -----

Type ATH1DT* instead of ATDT* to avoid the 6 second timeout. The H1 command forces the modem to go off hook which then allows the dial command to proceed.

Power Macintosh Upgrades: Transferring Serial Number (4/94)

Revised: 4/7/94
Security: Everyone

Power Macintosh Upgrades: Transferring Serial Number (4/94)

==========

Article Created: 7 April 1994

TOPIC ----------

When performing Power Macintosh upgrades, one of the items included is a new case, however the new case does not have a serial number on it. What should be done to provide the customer with a serial number on their upgraded Macintosh?

DISCUSSION ----------

The Service Provider needs to write (using either indelible ink or an engraver) the serial number from the original unit into the blank space on the rear of the Power Macintosh where the serial number would normally go.

The customer should retain receipts that pertained to the original unit as well as the new unit. (Do not try to remove the old serial number from the old unit as it might rip or tear in the process).

PowerTalk and Power Macintosh Upgrade Card Problem (4/94)

Revised: 4/7/94
Security: Everyone

PowerTalk and Power Macintosh Upgrade Card Problem (4/94)

==========

Article Created: 6 April 1994

TOPIC ----------

I just installed a Power Macintosh Upgrade Card and it's software on my Macintosh and now PowerTalk acts up and I crash. What is the problem?

DISCUSSION ----------

The software Installer for the Power Macintosh Upgrade Card installs System 7.1 for 680x0 mode operation, PowerTalk requires System 7.1.1. After turning the Power Macintosh Card on in the Power Macintosh Card Control Panel, Shutting Down, and restarting you are in PowerPC 601 mode. The PowerTalk Manager contains the Drag Manager. The Drag Manager requires Process Manager 7.1.1 or later. As soon as you attempt to drag anything the computer will crash.

To use PowerTalk on a Power Macintosh Upgrade Card you must do the following:

1) Install the Power Macintosh Upgrade Card and its software.

2) Run the System 7 Pro Installer from the System 7 Pro "Install" disk. Even better, boot off that disk in 680x0 mode and run the Installer. This will re-install System 7 Pro when running your computer in 680x0 mode.

For optimum performance and stability in PowerPC mode, we recommend using the PowerTalk for Power Macintosh installer v. 1.0.2, which correctly handles both Power Macintosh computers and Power Macintosh Upgrade Cards.

The READ ME file on the NEW version of the PowerTalk for Power Macintosh installer includes these installation instructions.

All of the above applies with equal force to PowerShare Collaboration Servers, with one additional caveat: Although there are no known incompatibilities with PowerShare and Power Macintosh Upgrade Cards, we don't recommend this configuration.

Communication Slot: Specifications (5/96)

==========

Article Created: 7 April 1994
Article Reviewed/Updated: 29 May 1996

TOPIC -----

I'm looking for information on the communications slot used in many Macintosh LC and Performa computers.

DISCUSSION -----

The following computers have the communications slot:

Begin_Table

Macintosh 575 family
Macintosh 630 family
Macintosh 5200 family
Macintosh 5300 family
Performa 6200CD series
Performa 6300 series

End_Table

The Communication slot is a 112 pin slot with a 32-bit wide data path.

Following is the pinout description for the communication slot:

Begin_Table

Signal Name	Pin#	Pin#	Signal Name

End_Table

There are four communication slot cards available:

- Macintosh Express Fax/Modem - M2480LL/A (Discontinued)
- Apple Ethernet CS Twisted Pair Card - M3065Z/A
  (for use with a 10BASE-T compatible hub)
- Apple Ethernet CS Thin Coax Card - M2708Z/A
- Apple Ethernet CS AAUI Card - M3066Z/A

Note:
The following computers are in the corresponding Macintosh families and series:

- Macintosh 575 family: LC 575, 580, Performa 575, 577, 578, 580

- Macintosh 630 family: LC 630, LC 630 DOS Compatible, Quadra 630, Performa 630, 630CD, 631CD, 635CD, 636, 636CD, 637CD, 638CD, 640CD

- Macintosh 5200 family: Power Macintosh 5200/75 LC, Performa 5200, 5210, 5215, 5220.

- Macintosh 5300 family: Power Macintosh 5300/100 LC, Performa 5300.

- Performa 6200CD series: 6200, 6205, 6214, 6216, 6218, 6220, 6230.

- Performa 6300 series: Performa 6300, 6290.

*Note: To distinguish between those cards that are compatible with the Power Macintosh 5400 from those compatible with earlier models, the communication slots themselves are named distinctly. The communications slot in previous models is referred to as "comm slot I" whereas the slot in the Power Macintosh 5400 is called "comm slot II".

The Tech Info Library article "Power Macintosh 5400: New Communications Slot" contains information on the Power Macintosh 5400 communciations slot.

Apple Multiple Scan 17 Display: Using Display Adapters (3/96)

Revised: 3/15/96
Security: Everyone

Apple Multiple Scan 17 Display: Using Display Adapters (3/96)

==========

Article Created: 8 April 1994
Article Reviewed/Updated: 15 March 1996

TOPIC

This article provides information on which Apple video cards and computers need display adapters to get greater resolution from the Apple Multiple Scan 17 Display.

DISCUSSION

The Apple Multiple Scan 17 Display has several resolutions. Macintosh computers designed before the introduction of Apple Multiple Scan 17 Display will only recognize the display as a 14-in color display without an adapter. Display adapters, available through Apple resellers and the third-party companies, contain a sense code that tricks the Macintosh into believing that the display is fixed frequency 16-in. or 19-in. display. Without the adapter, the display will be fixed at a 640x480 resolution.

Computers and Video Cards Not Requiring Video Adapters

Power Macintosh family
Macintosh Centris
Macintosh Quadra
Macintosh LC 475
Macintosh Performa 475 and 476
Macintosh Display Card 24AC
Macintosh 630 Family

These units use the Apple Multiple Scan software to change resolutions.

Computers and Video Cards Requiring Video Adapters

Macintosh II Family

PowerBooks
Duo Dock and MiniDock*
Macintosh Performa Computers (except 475 and 476)
Macintosh LC, LC II, LC III
Video Cards - 4•8, 8•24, 8•24GC

* - The Duo Dock does not require a video adapter to change resolutions when System 7.5 is installed.

Maximum Resolutions With Video Adapters

Computer	832x624	Notes
Macintosh II	No	1
Macintosh IIx	No	1
Macintosh IIfx	No	1
Macintosh IIcx	No	1
Macintosh IIci	No	2
Macintosh IIsi	No	2
Macintosh IIvx	No	2
Macintosh LC	No	2
Macintosh LC II	No	2
Macintosh LC III	Yes	
Performa 400	No	2
Performa 405	No	2
Performa 410	No	2
Performa 430	No	2
Performa 450	Yes	
Performa 460	Yes	
Performa 466	Yes	
Performa 467	Yes	
Performa 600	No	2
PowerBook 160	Yes	
PowerBook 165	Yes	
PowerBook 165C	Yes	
PowerBook 180	Yes	
PowerBook 180C	Yes	
Duo & MiniDock	Yes	3
4•8, 8•24, 8•24GC	Yes	

Notes:
1) No built-in video. Video is limited only by the video card used.
2) Limited to a resolution of 640x480 with built-in video.
3) The Duo Dock does not require a video adapter to change resolutions when System 7.5 is installed.

Display adapters are available from several third-pary companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

This article provides information about a non-Apple product. Apple Computer,

Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Article Change History:
15 Mar 1996 - Corrected PowerBook model.
09 Feb 1996 - Added additional adapter information.
20 Apr 1995 - Added System 7.5 and Dou Dock information.

Apple Multiple Scan 17 Display: Specifications (5/95)

==========

Article Created: 8 April 1994
Article Reviewed/Updated: 5 May 1995

TOPIC ----------

This article gives the technical specifications for the Apple Multiple Scan 17 Display.

DISCUSSION ----------

Picture Tube

- 17-inch diagonal Trinitron CRT (16.5-inch viewable)
- Multiple scan
- Resolution range: 640x480 to 1024x768

Screen

- .26 millimeter (mm) stripe pitch
- Bonded glass panel with antiglare/antistatic multilayer coating

Input Signals

Red, green, and blue signals; separate sync, composite sync, and composite video

Power Savings feature

Conforms to the Energy Star program of the United States Environmental Protection Agency

User Controls

- Power-on switch
- Automatic degauss at power-up; manual degauss by turning power switch
. off, then on (capable of full degauss after monitor is turned off for

. 20 minutes or more)
- Control buttons: Reset, Control, Command, Brightness, Contrast
- Additional picture controls available using the Command button:
. horizontal and vertical shift, horizontal and vertical size, rotation,
. horizontal and vertical convergence, and color temperature

Active Video Image Area

Adjusted at the factory for the following standard modes:

Mode	Resolution	Vertical Refresh Rate (hertz)	Horizontal Scan Rate (kilohertz)
VGA	640x480	59.95	31.47
Macintosh	640x480	66.7	35.0
VESA	640x480	75.0	37.5
VESA	800x600	75.0	46.9
SVGA	800x600	55.98	35.16
800x600	800x600	60.0	37.8
Macintosh	832x624	75.0	49.73
Macintosh	1024x768	75.0	60.2
1024x768	1024x768	60.0	48.3

Input Electrical Requirements

Voltage: 90-132, 198-260 V
Frequency: 47-63 Hz
Power: 150 W maximum

Weight

Approximately 50 pounds (22.5 kilograms)

Dimensions

Height: 424 mm +/- 5 mm
Width: 405 mm +/- 5 mm
Depth: 452.3 mm +/- 5mm

Interfaces

- Apple Desktop Bus (ADB): one input port and two pass-thru output ports
- Microphone: One Input and one pass-thru port
- Headphone/Speaker: One input and one pass thru output port

Operating Environment

Temperature
- Operating: 10 to 40 degrees C (50 to 104 degrees F)
- Storage: 0 to 60 degrees C (32 to 140 degrees F)
- Shipping: -40 to 60 degrees C (-40 to 140 degrees F)

Humidity (noncondensing)
- Operating: 10% to 80%
- Storage: 5% to 90%
- Shipping: 5% to 95%

Altitude (maximum)
- Operating: 10,000 ft. (3048 m)
- Shipping: 35,000 ft. (1067 m)

Safety

Meets strict SWEDAC MPR-2 requirements for low-frequency (ELF and VLF) magnetic and electric emissions.

System Requirements

- Power Macintosh, Macintosh Centris, Macintosh Quadra, or any NuBus
. compatible Macintosh with a Macintosh Display Card 24AC.
- Macintosh II family, PowerBooks, Duo Dock* and MiniDock, Macintosh
. Performa, Macintosh LC, LC II, LC III, and Macintosh computers with
. 8•24, 8•24GC, 4•8 video cards installed work in the 640x480 video
. mode. Other modes are possible with additional adapters.
- System software version 7.1 or later

* - The Duo Dock requires a video display adapter to change resolutions unless System 7.5 is installed.

Monitor Cable Specifications

15-pin miniature D-type connector

Monitor Signals
===============

Pin	Output Signal
1	Red video ground
2	Red video
3	Not used
4	ID 1
5	Green video
6	Green video ground
7	ID 2
8	Not used
9	Blue video
10	ID 3
11	V Sync return
12	V Sync
13	Blue video ground
14	H Sync return
15	H Sync
Shell	Shield ground

Article Change History:
05 May 1995 - Made minor corrections.
20 Apr 1995 - Added information on System 7.5 and Duo Dock.
14 Mar 1995 - Corrected wording of MiniDock.

Apple Displays: Model Numbers (1/95)

Revised: 1/19/95
Security: Everyone

Apple Displays: Model Numbers (1/95)

==========

Article Created: 7 April 1994
Article Reviewed/Updated: 9 January 1995

TOPIC -----

This article lists model numbers that appear on the information tag on the back of Apple displays.

DISCUSSION -----

Many times the only information people have is the model number. This chart can be used to determine the monitor they have from the model number.

Number on Monitor	Monitor Name
M0400	Apple High-Resolution Monochrome Monitor
M0401	AppleColor High-Resolution RGB Monitor (13-in Rev A)
M0402	Apple Two-Page Monochrome Monitor (Rev A)
M1025	Apple Two-Page Monochrome Monitor (Rev B)
M0404	Macintosh Portrait Display (Rev A)
M1030	Macintosh Portrait Display (Rev B)
M1297	AppleColor High-Resolution RGB Monitor (13-in Rev B)
M1050	Macintosh 12-in Monochrome Display
M1296	Macintosh 12-in RGB Display
M1212	Macintosh Color Display
M2001	AudioVision 14 Display
M1298	Macintosh 16-in Color Display
M1787 or M2346	Apple Color Plus 14-in Display
M1823	Apple Multiple Scan 20 Display
M3502	Macintosh 21-in Color Display
M2494	Apple Multiple Scan 17 Display
M2943	Apple Multiple Scan 15 Display

Article Change History:

09 Jan 1995 - Added New number for Color Plus Display.
13 Dec 1994 - Corrected MS 17 and 15 family numbers.
22 Sep 1994 - Added Multiple Scan 17 and 15 Displays

AWS 95: SyQuest and Removable Media Support (4/94)

Revised: 4/11/94
Security: Everyone

AWS 95: SyQuest and Removable Media Support (4/94)

==========

Article Created: 8 April 1994

TOPIC -----

I'm curious about support for removable media under A/UX 3.1 running on an Apple Workgroup Server 95 (AWS 95). People have indicated to me that there were plans for removable media support in A/UX 3.1, but they are unclear if this feature made it into the final release of software.

Specifically, with AppleShare Pro and A/UX 3.1 on an AWS 95, can SyQuest and Magneto Optical drive be supported so that the media can be ejected and changed without shutting down AppleShare Pro?

DISCUSSION -----

The AWS 95+ Upgrade ReadMe files states that support has been added, "for automatic mounting and unmounting of removable media SCSI drives from the Finder." But that is all it says. Here is a little more detail:

Under A/UX 3.1, the SyQuest disks can be mounted and unmounted. To unmount a disk, you push the eject button on the drive and then throw the drive icon in the trash. The optical drives should work as well. To unmount a disk, you throw the drive icon in the trash and then push the eject button on the drive.

NOTE: Magneto Optical drives have not been tested on A/UX 3.1 so we cannot say for sure how well they will work.

GeoPort: Maximum Number Of Simultaneous Addresses (4/94)

Revised: 4/11/94
Security: Everyone

GeoPort: Maximum Number Of Simultaneous Addresses (4/94)

==========

Article Created: 11 April 1994

TOPIC -----

I have a customer who wants to know maximum number of addresses he can send the same fax to simultaneously using the GeoPort for Power Macintosh (version 1.0) software.

DISCUSSION -----

Previous testing allowed up to 145 recipients in the Send To field. According to the engineering team there is no limit to the number of recipients for a fax. Since the Fax software for GeoPort is the same as the PowerBook Fax software, this applies to the PowerBook family as well.

LaserWriter Select 360: Canceling a Fax Job (4/94)

==========

Article Created: 11 April 1994

TOPIC ----------

How do I cancel a fax job which I have set to retry five times on the LaserWriter Select 360 with fax option?

DISCUSSION ----------

At this time, there is no way to cancel fax jobs or retries except to turn the printer off. Apple and Adobe are looking to add a feature in a successive release of software, which will enable a user to cancel fax jobs or retries.

Extension Manager: Not all Control Panels Listed (4/94)

Revised: 4/11/94
Security: Everyone

Extension Manager: Not all Control Panels Listed (4/94)

==========

Article Created: 8 April 1994

TOPIC -----

Why doesn't Extension Manager 2.01 list all control panels in the Control Panels folder?

DISCUSSION -----

Extensions Manager will only list those files that have an INIT resource, or files that are set to be listed regardless of whether they have INIT code in them or not.

Using the Configure option you can add you own file types that Extensions Manager should list. To find out the file type of a given control panel or extension you may use DeskZap (a shareware desk accessory) or ResEdit.

DOS Compatibility Card: How Memory Is Allocated (9/95)

Revised: 9/29/95
Security: Everyone

DOS Compatibility Card: How Memory Is Allocated (9/95)

==========

Article Created: 11 April 1994
Article Reviewed/Updated: 28 September 1995

TOPIC ----------

When using the DOS Compatibility Card, is it possible to allocate all of the memory in the computer to the DOS side if that is the only thing that I need use during a session?

DISCUSSION ----------

Memory is allocated in the PC Setup Control Panel. The memory allocated is physical RAM on the main logic board of the Quadra or Centris 610. You have to have a minimum of 4 MB allocated to the Macintosh operating system. This means that you cannot allocate all the RAM on the logic board to the DOS Compatibility Card. As you upgrade RAM on the Quadra or Centris 610 logic board you can allocate more memory to the DOS Compatibility Card. For example, if you installed a 16 MB SIMM in a Quadra 610, you can assign 12 MB of RAM to the DOS Compatibility Card.

You can also add memory to the DOS Compatibility Card by installing a SIMM into the SIMM slot on the DOS Compatibility Card. However, you can't use any of the RAM installed on the Macintosh for the DOS Compatibility Card once you install a SIMM on the DOS Compatibility card. You also can't use the DOS Compatibility Card RAM as part of your Macintosh computer's memory.

PlainTalk Microphone: Not Supported On Current Displays (4/95)

Revised: 4/19/95
Security: Everyone

PlainTalk Microphone: Not Supported On Current Displays (4/95)

==========

Article Created: 11 April 1994
Article Reviewed/Updated: 19 April 1995

TOPIC ----------

I have connected my Apple Microphone (round) to the microphone pass through port on my Macintosh 16-in. Color Display. When I attempt to record sound to my Macintosh Quadra 840AV, nothing happens.

DISCUSSION ----------

The AV Macintosh computers and all Power Macintosh models use the PlainTalk Microphone instead of the older Apple Microphone. The PlainTalk Microphone requires additional voltage from the Macintosh to amplify the signal. All of Apple's current displays, includes all Multiple Scan Displays, are not setup to pass the voltage to the PlainTalk Microphone. To use the PlainTalk Microphone, it must be connected directly to the Macintosh AV or Power Macintosh computer.

Article Change History:
18 Apr 1995 - Added information on all Multiple Scan Displays.
13 Apr 1994 - Added Power Macintosh and the MS 17 Display.

Imagewriter II: Paper Guide Screw Specifications (4/94)

Revised: 4/12/94
Security: Everyone

Imagewriter II: Paper Guide Screw Specifications (4/94)

==========

Article Created: 12 April 1994

TOPIC ----------

What are the specifications for the screws that hold the clear plastic paper guide in place on the ImageWriter II?

DISCUSSION ----------

The paper guide is mounted using two 6mm long, 2.6 mm wide metric threaded panhead screws with a captive lock washer. The screws can be very difficult to find. To locate possible sources for metric screws, check your local yellow pages under "screws" for possible suppliers. Some hobby and hardware stores may also carry compatible screws.

Power Macintosh: Some Printer Drivers Not Installed (2/96)

==========

Article Created: 12 April 1994
Article Reviewed/Updated: 19 February 1996

TOPIC ----------

I cannot find the printer driver for several Apple printers on my Power Macintosh 6100 computer. Where are the printer drivers?

DISCUSSION ----------

As you mentioned, several Apple printer drivers were not included with the System 7.1.2 software. Below is a list of printer drivers not included. All the printer drivers are available through online services Apple publishes software updates on.

Begin_Table

Printer	Print Driver Used	Version
LaserWriter IISC	Personal LaserWriter SC	7.0.1
Personal LaserWriter SC	Personal LaserWriter SC	7.0.1
ImageWriter LQ	LQ ImageWriter	7.0.1
AppleTalk ImageWriter LQ	LQ AppleTalk ImageWriter	7.0.1
LaserWriter Select 310	LW Select 310	7.0
Apple Color Printer	Apple Color Printer	1.0
Color StyleWriter Pro	Color StyleWriter Pro	1.5.2
Portable StyleWriter	Portable StyleWriter	1.0.1

End_Table

As a reminder, the StyleWriter II and LaserWriter 300 drivers on the Power Macintosh disks are also used for the original StyleWriter, and Personal LaserWriter LS and LaserWriter Select 300 printers respectively.

These articles can help you locate the software update mentioned here:

• "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
19 Feb 1996 - Replaced entire discussion with updated information.

LaserWriter Pro 810 and NetWare 3.1x (7/96)

Revised: 7/1/96
Security: Everyone

LaserWriter Pro 810 and NetWare 3.1x (7/96)

==========

Article Created: 15 April 1994
Article Reviewed/Updated: 1 July 1996

TOPIC ----------

This article describes an incompatibility when connecting a LaserWriter Pro 810 to a NetWare 3.1x server, and a workaround configuration.

DISCUSSION ----------

Apple Computer's LaserWriter Pro 810 can work with Novell NetWare networks, but you'll find that a combination of software compatibility problems and documentation shortcomings make it challenging to configure for this environment using the information supplied with the printer. This document covers NetWare 3.11 and 3.12 using NetWare for Macintosh 3.011 or 3.12. Since most users will be connecting NetWare 3.1.X servers, we will focus on this configuration.

Configuring a NetWare 4.x server is not discussed in this document; however, most of the issues are the same. The configuration of printers and print queues in a 4.x environment is handled with different utilities.

Background

NetWare 3.1x servers can drive printers in one of two ways in the DOS/Windows environment:

- Use a PC on the network as a "Remote Print Server" with printers directly attached through serial or parallel connections.

- Locally attach a printer to the file server.

The "front end" remains the same with either of these configurations. You select a "print queue" to use on your DOS workstation that is defined and managed by the NetWare server. Your print job is spooled on the server and fed directly to the printer or remote print server. The capture of a print queue on a workstation is accomplished in a number of ways depending on the operating

system and user configuration of the workstation.

When an AppleTalk printer is attached to a NetWare network, a Macintosh may print to this printer:

- Directly to the printer in the traditional fashion, with no interaction with NetWare.

- Print via NetWare's ATPS (AppleTalk Print Spooler) which is part of Novell's NetWare for Macintosh product. This behaves much as Apple's AppleShare Print Server does by advertising a spooler in the Chooser and accepting print jobs from a Macintosh. ATPS normally sends spooled jobs directly to AppleTalk printers or it can pass the job to the DOS/Windows queues for processing on non-AppleTalk printers.

Incompatibility

The incompatibility, caused by a "half-open" PAP (Printer Access Protocol) session being created, is due to the implementation of the AppleTalk PAP protocol used in the LaserWriter Pro 810. The LaserWriter Pro 810 uses a different implementation of the AppleTalk stack and PAP protocol than was used in previous LaserWriter printers. NetWare uses a version of AppleTalk designed for most of Apple Computer's LaserWriter printers. A more in-depth description of a "half-open" PAP session follows.

The behavior of the NetWare ATPapOpenConn() call is to try one PAP OpenConn ATP TReq transaction for four seconds, then to give up and try an OpenConn on a new ATP (AppleTalk Transaction Protocol) transaction and PAP conn ID. The wait time field of the OpenConn request is only incremented when a new transaction is issued. This behavior was designed to allow for incrementing the OpenConn wait time without violating the internal boundaries between PAP and ATP in our protocol stack.

If a printer responds to an OpenConn request after the ATP transaction has expired, and ATPS has moved on to a new connection session, it can lead to a half open connection which takes two or three minutes to time out. The printer will not accept any other connections during this period. Due to this potential weakness in PAP, Inside AppleTalk recommends allowing twelve seconds before using a new ATP transaction and PAP conn ID to issue the OpenConn requests (5 tries at two second intervals).

As of April 1994, ATPS' behavior is to transmit one retry at two second intervals, for a total of only four seconds. ATPS is technically within the AppleTalk specification, but these intervals don't work with the LaserWriter Pro 810. This is not an issue with other Apple LaserWriters as they do not use the LaserWriter Pro 810 implementation of AppleTalk.

The result is the LaserWriter Pro 810 will look at one PAP connection session, while ATPS has moved on to another PAP session requesting attention on a new connection session. The printer will report its status as idle, but it's still busy (looking at the incorrect PAP connection). When that session finally times out, the LaserWriter Pro 810 will then try to service other PAP sessions that may have been waiting for its attention, but by that time, the newly created

ATPS PAP session has timed out, and it has moved on to creating another PAP session. The two versions of AppleTalk will then continue to chase each others out of sync "half open" PAP sessions endlessly.

SOLUTION

Configure NetWare print services to spool jobs to a LaserWriter Pro 810 from DOS and/or Windows computers, perform the following steps:
---

1) Determine if the DOS computers need to print to PCL4 (HP emulation) and/or Postscript printers.

2) PSERVER must be configured and run on the NetWare server using PCONSOLE from a DOS workstation. A print server must be defined, new printers must be defined, and the printers must be connected to queues. The PSERVER process will think it is using a remote print server when it prints to the LaserWriter Pro 810.

3) Ensure the server is configured to support the 802.3 frame type on the interface card that will provide IPX traffic to the LaserWriter Pro 810. The printer will not respond to 802.2 packets.

4) ATPS must be configured and loaded on the NetWare server to accept print jobs from Macintosh computers and pass the spooled print jobs to non-AppleTalk printers using NetWare's PSERVER NLM.

Configure the LaserWriter Pro 810 for DOS/Windows Use
---

1) Start by resetting the printer to factory defaults using the control panel on the front. This assures the factory printer setup is pristine and ready for NetWare use.

2) Print the Printer Status pages from the control panel on the front of the printer. This provides a list of default virtual printers. Make note of the two that begin with PSL20N… and LJL20N…

Modify File Server Configuration
---

1) Edit the AUTOEXEC.NCF file on the server to change or add a frame type of ETHERNET_802.3 to the Ethernet interface that the printer traffic will flow through. Without IPX bound to this frame type the PSERVER NLM on the NetWare server will never connect to the printer.

Creating & Configuring PSERVER

2) Log into the NetWare server from a DOS workstation as Supervisor and run the PCONSOLE utility.

3) Select "Print Server Information"

4) You may use an existing print server or press the Insert key to create a new print server.

5) After selecting the print server to configure select the "Print Server Configuration" option.

Configure the Printers

6) Select "Printer Configuration" option. You'll be presented with an empty list if this is a new print server configuration, otherwise you'll see a list of existing configured printers.

7) Select an unused printer number, unconfigured printers are labeled "Not Installed".

8) Name the printer with the appropriate name that appears on the printout of the virtual printers you obtained earlier. It will be the "LJL20N....." for HP Emulation, and/or "PSL20N....." for a Postscript printer.

9) Select the "Remote Parallel, LPT1" as the printer type. You can use this same type for all the printer definitions. There is no need for different IRQs or LPTs.

10) Retain the defaults for the rest of the settings and save changes by pressing the Esc key.

11) Repeat these steps for a second printer if you are configuring both HP and Postscript printers.

Creating the Print Queues

12) If you intend to add the configured printers to existing queues then skip to step 16.

13) Escape back to the main menu of PCONSOLE and select the "Print Queue Information" option.

14) Press the Insert key to create and name a new print queue. This name is the one the DOS stations will see when they capture the queue to print to so select a useful name.

15) Repeat the process to create a second queue if you are using both the HP and Postscript printers.

Attaching the Printers and Queues

16) Escape back to the main menu and select the "Print Server Information" option.

17) Select the print server you previously created and then select the "Print Server Configuration" option.

18) Select the "Queues Serviced by Printer" option. You'll see a list of the printers you created in the previous section.

19) Select each printer and use the Insert key to bring up a list of defined queues and attach the queue to the appropriate printer. You should be attaching one queue to one printer. Use the Esc key to save each one.

20) Escape back to the main menu and exit PCONSOLE.

At this point PSERVER is configured and ready to go. It will support DOS/Windows computers printing to Postscript or PCL4 virtual printers through NetWare queues.

If PSERVER is not currently running, it needs to be loaded at the System Console with a "load pserver [the name of your PSERVER]" command. If one is already running it needs to be unloaded and reloaded to run with the new name. After it loads you'll get a new screen on the console that shows the status of each of the defined printers. You'll notice that the initial status will be "Not Connected". Be patient! Eventually the status will change to "Waiting for job" as the server connects to the LaserWriter Pro 810 over the network. This can take several minutes.

Don't forget to edit your AUTOEXEC.NCF file if you want the PSERVER to load automatically at server boot time.

Configure the LaserWriter Pro 810 for Macintosh Printing Through NetWare

These steps are only needed when Macintosh computers will be printing through NetWare queues to the LaserWriter Pro 810. If printing straight to the printer the next section can be skipped.

Configure ATPS

ATPS is a NetWare module that drives AppleTalk printers and advertises a NetWare print queue in the Macintosh computer's Chooser. Because of the incompatibilities mentioned earlier, ATPS can't be used to print to the AppleTalk virtual printers in the LaserWriter Pro 810. Therefore, the Macintosh computer's print jobs must be routed from ATPS to PSERVER which will send it to the IPX virtual printer. ATPS must be configured and loaded if it is not currently in use on the NetWare server.

1) Load the Install NLM on the server.

2) Use the Alt-Esc keys to switch to the Install screen and select "Product Options".

3) Select the "NW-MAC" product.

4) Select the ATPS.CFG file.

5) If this file doesn't exist it will ask if you want to create it. Edit this file so it contains the following line;

```
-O "LW810 on IPX" -WB -L -F APPLWNTX
```

This example assumes the name you want to present in the Mac chooser for this queue is "LW810 on IPX". This name must match the queue name created in PCONSOLE.

Refer to the NetWare for Macintosh documentation for more information on the ATPS.CFG options.

6) Press the Esc key to save changes and exit the Install NLM.

7) If ATPS is currently running unload and reload it at the System Console prompt.

8) Edit the AUTOEXEC.NCF file to auto load ATPS at boot time if you desire.

The queue will now be advertised in the Chooser, users can submit their print jobs to this queue via ATPS and the print job will be serviced by PSERVER.

Create a New Virtual Printer on the LaserWriter Pro 810

A new LaserWriter Pro 810 Virtual Printer will need to be created because many Macintosh applications print in a BINARY form as opposed to DOS systems printing postcript in ASCII, and the Novell print server combination not being able to convert Binary to ASCII and vice versa. Not doing this last step will cause some (EPS) postcript print jobs to go into the Novell print Queue and then get flushed with no output to the printer.

1) Connect to the printer's command console through TelNet or serial connection through the command console connector. Login as the Super User. For more information on cable see Appendix A.

2) Issue these commands to create a new virtual Postscript Printer for Macintosh printing use. Select a name for the a new virtual printer that explains what it is like "MacIPX". This name is "(a name)" in the following steps.

3) CHANGE SERVICE (a name) COPY (Name of existing virtual Postscript printer. Begins with "PSL20Nxxxxxx".)

4) CHANGE SERVICE (a name) PORT 1

5) CHANGE SERVICE (a name) PROTOCOL NETWARE ENABLE

6) CHANGE SERVICE (a name) PROTOCOL LAT DISABLE

7) CHANGE SERVICE (a name) BINARY ENABLED

8) Print the Printer Status pages from the control panel on the front to verify the new Virtual Printer setup. It should appear the same as the original PostScript virtual printer except for a different name and the Binary Mode will be enabled.

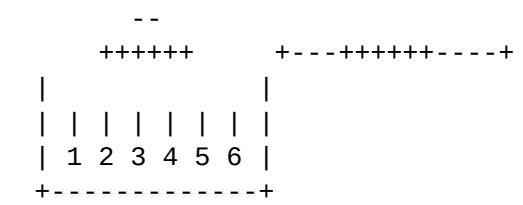
Add a new Queue and printer definition to the NetWare server's Pserver

configuration just as the previous section details. The new queue you're setting up is only for use by Macintosh computers, it will not print DOS jobs correctly!

Appendix A.

The LaserWriter Pro 810 includes an RJ12 maintenance port that can be accessed via a standard DEC terminal or almost any terminal emulation software package. In order to connect a Macintosh to the port special cable needs to be constructed. The cable requires an RJ12 and a DIN-8 connector, along with suitable 6 wire cable.

RJ12 Diagram



DIN-8 (male) Diagram

Maintenance port to Macintosh wiring diagram

RJ12		DIN-8	
		2	---------- 5 (RXD)
5	----------	3	(TXD)
3,4	----------	4,6,8	(GND)
6	----------	1	(DTR)
1	----------	2	(CTS)

Configure a terminal emulation package for 9600 baud, 8 data bits, 1 stop bit, and no parity. After turning the printer on the terminal should display a list of diagnostic information which will continue until the printer is ready to print.

In order to log into the remote Console Facility (RCF), wait until the message 'Server -993- Server ready for logins' appears and then press return. The terminal should prompt for a username. The default username is 'access.' Typing 'show server status' at the 'server>' prompt is one of many commands that can be entered in order to obtain statu information about the printer.

In order to make changes to the print server you must have superuser status. Enter 'su' at the 'server>' prompt. The terminal will then ask for a password.

The default password is 'system.' As long as the password is correct the prompt will change from 'server>' to 'server>>' indicating that the superuser mode is enabled. For additional information regarding the remote console facility (RCF) consult the network installation and configuration manual.

Power Macintosh: Software Included With Upgrades (4/94)

Revised: 4/12/94
Security: Everyone

Power Macintosh: Software Included With Upgrades (4/94)

==========

Article Created: 12 April 1994

TOPIC -----

A customer purchased a Power Macintosh upgrade and wants to know whether or not he is entitled to the extra software that ships with Power Macintosh systems.

DISCUSSION -----

The Power Macintosh Logic Board Upgrade ships with both:

- The CD that contains the software that comes installed on a Power Macintosh (except for PlainTalk, which is not on the CD, but is included on the hard drive of AV Power Macintosh configurations). This would include the Apple Extras folder.

- The 5 disks which contain only the system software necessary to install the Power Macintosh System Software. These disks do not include the Apple Extras folder. These disks are included in this upgrade kit for customers who are upgrading a system which does not have a CD-ROM drive installed.

The Power Macintosh Upgrade Card, on the other hand, ships with only the System Software (5 disks) required to install the Power Macintosh System Software. The Apple Extras folder is not included with these disks (same disks as the second bullet above).

A customer is only entitled to the software that ships with whichever upgrade product he purchased. If he purchased the Upgrade Card, he will not receive the Apple Extras folder. If he purchased a Logic Board Upgrade and does not have a CD drive, he has the additional software but would need access to a CD drive long enough to copy it to his hard drive.

Newton Connection Kit: Import & Export Translation Errors (4/94)

Revised: 4/12/94
Security: Everyone

Newton Connection Kit: Import & Export Translation Errors (4/94)

==========

Article Created: 12 April 1994

TOPIC -----

I am trying to setup a template for importing and exporting to-do items from the datebook application using the Macintosh version of the Newton Connection Kit 2.0. However I have found that if there is a carriage return embedded within the text of a to-do item, the exported files don't contain the information after the carriage return in the proper record. The information ends up in multiple records when imported into another application. How can I get all the information in one record?

DISCUSSION -----

Export templates in the Newton Connection Kit for Macintosh write data into ASCII text files. Fields are delimited by a TAB character and records are delimited by a Carriage Return (CR) character. This is customizable within the connection kit. The problem here is that the text being exported from the Newton, a to-do item, contains one of the delimiting characters, a carriage return. When another program reads the exported file, it will read the embedded carriage return in the text as a record separator. The following excerpt from the Newton Connection Kit 2.0 read me file details the problem:

"There are situations in which a file exported using a template and then reimported into a Newton Connection Kit file may lose information. The templates import and export files with text only. This means that any graphics in your Newton data will not be exported if you use a template. Furthermore, if your data contains tabs, returns or multiple paragraphs (**), some of it may be lost if you export with a template that uses Tab and Return as the field and record separators. To avoid this, click Options in the Template dialog and choose a character that does not appear in your data as the separator, or export in Newton Connection format. If you want to move all information from one Newton Connection Kit file to another, it is strongly recommended that you use the Newton Connection format to import and export the information.

(**) Multiple paragraphs are concatenated with Carriage Returns. "

This type of problem is common throughout the computer industry.

Workaround

An option is configuring the Newton connection kit to have specific delimiters with the import and export programs.

With Newton Connection 2.0 for Macintosh, you can do the following:

1) Go to the File menu and choose "Create Template..." and pick an application you wish to create a template for. Use "Edit Template..." if you are modifying an existing template.

2) Click on the "Options" button

3) Configure the record and field separator characters in the spaces provided. It is helpful to choose "non" display characters that will not be embedded in the text. The "Key Caps" application available from the Apple Menu can provide some good choices.

Then, when you want to import the data in another application, configure the import option to use the same delimiters. You need to consult the documentation for your specific application if you need additional information on how to do this. However, there can be additional problems since not all applications can be configured. In those cases, the only solution is to change the text that contains one of the delimiters on the Newton.

Starcore Dyno Notepad: Note Size Limit (4/94)

==========

Article Created: 12 April 1994

TOPIC -----

Can I create files that are greater than 4k in the Starcore Newton application called Dyno NotePad?

DISCUSSION -----

Both the Newton MessagePad and Dyno Notepad limit the size of note of 4k. The Dyno Notepad limit is on the sizes of individual note items or "topics". Dyno Notepad allows more flexibility in individual notes, by allowing multiple 4k topics.

Each topic of a dynonote can be up to 4K in size. When it reaches that 4K limit, the segment's bar stops and its length cannot be extended (the bar is just like the bar in the todo section of the Datebook application). This happens even if it is the bottom-most segment (you will just have an empty screen below it).

Once you reach the 4k barrier, you can draw a line to create a new topic segment, and you can continue the note what you were writing. It looks like one long segment (the bar remains contiguous between the two segments) but has an extra triangle next to the bar indicating that it is physically two parts. So it flows well, even though it is physically two different segments.

LaserWriter 8.1.1: Setting Default Paper Tray (4/94)

Revised: 4/14/94
Security: Everyone

LaserWriter 8.1.1: Setting Default Paper Tray (4/94)

==========

Article Created: 14 April 1994

TOPIC ----------

I am using a LaserWriter Select 360 with the LaserWriter 8.1.1 printer driver, and cannot make the lower tray the preferred tray option. After printing a document, the printer always defaults back to ALL trays. How can I make the lower tray the preferred paper tray?

DISCUSSION ----------

If you performed a set-up in the print window, the information is not stored for later print jobs. If you want to set the default paper tray, you need to configure the LaserWriter 8.1.1 in the chooser.

To select the default paper tray:

1) Open the chooser and select the LaserWriter 8.1.1. driver
2) Click SETUP
3) Click Configure
3) Select 250/500 Installed and Preferred.

Once the printer software is configured, the printer uses the paper tray you selected.

AWS 95: NCSC Security Levels Available (4/94)

Revised: 4/22/94
Security: Everyone

AWS 95: NCSC Security Levels Available (4/94)

==========

Article Created: 12 April 1994

TOPIC ----------

I'm using an Apple Workgroup Server 95 (AWS 95) with Oracle in a TCP/IP environment. I am very concerned about the AWS 95 computer's security, since it will be serving mission-critical data and will be Internet accessible.

I'd like to know what additional security measures are available for A/UX, and to ensure that they will not break Oracle. Minimally, I need support for a shadow password file, but I would prefer full C2 security.

Does Apple have a C2 secure version of A/UX, and is it compatible with the AWS 95 with Oracle7?

DISCUSSION ----------

According to the NCSC (National Computer Security Center) evaluation criteria, seven levels of trust called Classes have been defined. The AWS 95 server based on A/UX 3.1 (the latest version) doesn't, in general, meet the C2 class requirements, it only meets the C1 class level. AppleShare and AppleShare Pro also are in the C1 class security category.

As of April 1994, Apple doesn't have a C2 security version of A/UX.

Below is more information on the NCSC security classes:

The increasing order of trust (from left to right),
D, C1, C2, B1, B2, B3, and A1.

```
     D       C1       C2      B1      B2     B3      A1
  <-------------------------------------------------------->
     not               increasing security           highly
     secure                                          secure
```

D systems aren't trusted. A1 systems are extremely resistant to compromise.

Up to level B3, each Class introduces additional features and functions to counter specific threats that weren't countered by lower Classes. For example:

- C2 introduces the "audit" function.
- B1 adds "security labels" to all objects.
- B2 adds a "trusted path."
- B3 adds a "trusted recovery" feature.

Class A1 adds no features or functions over a Class B3 system. The software system for a Class A1 system is identical to Class B3 system. However, the Class A1 system is more trusted because it is subjected to extremely rigorous design verification, threat analysis, construction, testing, inspection, distribution, and operational procedures covering hardware, firmware, and software.

Apple MessagePad: Use Of Third Party PCMCIA Cards (5/95)

Revised: 5/9/95
Security: Everyone

Apple MessagePad: Use Of Third Party PCMCIA Cards (5/95)

==========

Article Created: 13 April 1994
Article Reviewed/Updated: 9 May 1995

TOPIC ----------

An Apple MessagePad customer would like to use a low-capacity PCMCIA storage card (256KB) for data transfer. The customer is quite sensitive to the cost of the equipment for this project and can get 256K PCMCIA RAM cards inexpensively.

The customer needs to know the following:

• Can the Apple MessagePad 100/110 use a 256K card?

• Will any third party storage cards work in the MP 100/110?

• If so, what does the customer need to know about a third party storage card to ensure that it will work in the MP 100/110?

DISCUSSION ----------

The Apple MessagePad and Apple MessagePad 110 have very specific requirements for the types and kinds of PCMCIA cards that can be used. In general there are two types of RAM cards that currently work with the Apple MessagePad PCMCIA slot: static-RAM (SRAM) and Flash RAM. The PCMCIA slot uses Type II cards which are 5 mm thick and support a 16-bit data bus.

SRAM cards generally write data to memory more quickly than Flash RAM but both types provide similar data-access speeds. SRAM is volatile so it requires the card be powered at all times or the data disappears. Most SRAM cards ship with batteries that must be changed intermittently, usually between two and four years. Additionally SRAM cards generally have smaller capacities ranging between 256K and 1 MB of storage.

Flash RAM cards for the Apple MessagePad must be Series II Flash RAM sold by Apple. These cards have the Intel-made interface chip, which the Apple MessagePad looks for, including the FlashFile System that functions as the OS

for the card. Other manufacturers' Flash RAM, which may also include the Intel Flash RAM chips, are incompatible with the Apple MessagePad because the interface chip is not part of these cards.

Third party SRAM cards, while not supported for use in the Apple MessagePad, generally work. The primary limitation in using an SRAM card is the size and type of data that can be stored on the card. Most data types can be placed on static-RAM cards including small applications and soups. The exception is a backup archive. No backup files can be placed on any SRAM card.

Finally, while the Apple MessagePad most likely supports the 256K card you describe, Apple recommends using Flash RAM cards for Apple MessagePad storage because Flash RAM is usually less expensive per MB than SRAM.

Newton: Assistant Uses Last Written Text (4/94)

Revised: 4/13/94
Security: Everyone

Newton: Assistant Uses Last Written Text (4/94)

==========

Article Created: 12 April 1994

TOPIC -----

When I write in the notepad, then press the Assist button, the last couple of sentences written on the notepad appear in the Assist window. The Newton then tries to interpret the text and fails. Why does the Assistant do this?

DISCUSSION -----

The assistant was designed to take what was last written in a note area and use the text to assist the user. For example, you can write "CALL STEVE" in the notepad and tap assist without highlighting the text. This makes Newton's notepad acts like a slip of paper where you can jot down an instruction and say "do it."

You should tap once somewhere in a blank space area on the notepad and then tap assist if you want the assistant to come up without text in the assistant window.

Newton Connection Kit: Exporting Repeating Meetings (4/94)

Revised: 4/13/94
Security: Everyone

Newton Connection Kit: Exporting Repeating Meetings (4/94)

==========

Article Created: 12 April 1994

TOPIC -----

Why does the Newton Connection Kit 2.0 for Macintosh export repeating meetings to other applications as individual meetings?

DISCUSSION -----

Repeating meetings are exported as individual meetings to handle the requirements of the application program that the information is imported into. This is done because there is a need to handle exception meetings. Most applications do this by storing repeating meetings as individual meetings. For example, create a repeating meeting for every Tuesday. Then pick one week that you have to go to the dentist on Tuesday but you still need to have the meeting so you change the meeting to Wednesday. Now you have repeating meetings for Tuesdays with one exception meeting for one week on Wednesday. This information would be lost if repeating meetings were not exported as multiple single meetings.

Newton Connection Kit for Windows: Using a Logitech Mouse (4/94)

==========

Article Created: 12 April 1994

TOPIC -----

This article describes compatibility problems between the Logitech Mouse and the Newton Connection Kit for Windows.

DISCUSSION -----

When using the Newton Connection for Windows with a Logitech FirstMouse, the mouse cursor, or arrow, will travel across the screen in random direction without user interaction.

This is usually caused by a misconfigured Windows mouse driver. Change the configuration of the mouse using the Windows Setup program from "Microsoft or IBM PS/2 mouse" to "Logitech Mouse".

DOS Compatibility Card: No Print Drivers Required for DOS (4/94)

Revised: 9/29/95
Security: Everyone

DOS Compatibility Card: No Print Drivers Required for DOS (4/94)

==========

Article Created: 12 April 1994
Article Reviewed/Updated: 28 September 1995

TOPIC ----------

How does the DOS Compatibility Card print to a printer? Do I redirect the output to one of the Macintosh serial ports, or are there drivers included for Window and DOS applications?

DISCUSSION ----------

The DOS Compatibility Card uses the printer selected in the Chooser. The DOS Compatibility Card software supports Epson and PostScript printer output. QuickDraw printers such as the StyleWriter or ImageWriter work only with Epson drivers (if a printer is not a PostScript Printer, it's considered a QuickDraw printer). When choosing a non-PostScript printer in DOS, you should select either an Epson LX or Epson LQ printer driver.

IMPORTANT: If you try to print a file and you're using a PostScript printer driver for a non-PostScript printer, your file will not be printed. Instead, the spool file will be moved to a folder called "Spooler Rejected" in the Macintosh Environment. To print the file, choose the proper printer driver in the DOS environment and try again.

The DOS Compatibility card supports two serial ports, COM1 and COM2. You can map these ports, in the PC Setup control panel, to an unused Macintosh printer or modem port, a text file, or to a setting of none.

When printing to non-PostScript printers from DOS, the information goes through printer emulation and also through the Macintosh printer driver. This process makes printing multiple pages from DOS slower than printing from a Macintosh application. Because of this, whenever possible you should print from the Macintosh side of the computer.

To print a DOS document from a Macintosh application, you need to cut and paste

the information. The DOS Compatibility Card comes with software that converts the DOS or Windows clipboard into information the Macintosh clipboard can use.

If a PostScript printer is attached to the Macintosh computer, then DOS and Windows doesn't have to go through the printer emulation process. This enables DOS and Window documents to print at the same speed as Macintosh documents to the same printer.

When using a PostScript printer in DOS or Windows, choose the driver that matches your printer. Some DOS applications only let you select the option of printing to a generic PostScript printer. This works fine except you will not be able to use any of the special paper tray capabilities of you printer.

Power Macintosh AV: Monitors Ctrl Panel Shows Ghost Monitor 1/96

Revised: 1/23/96
Security: Everyone

Power Macintosh AV: Monitors Ctrl Panel Shows Ghost Monitor 1/96

==========

Article Created: 15 April 1994
Article Reviewed/Updated: 23 January 1996

TOPIC ----------

When I go into the Monitors control panel on any Power Macintosh with more than one NuBus or PCI bus video card installed, it indicates that I have two monitors connected, but I only have one. Why does this happen?

DISCUSSION ----------

On the AV Power Macintosh computers, if you have a monitor connected to the high-density monitor port, the Monitors control panel assumes that a television is connected to the S-video output port, even if there is no television connected. The control panel displays an image of a second "ghost" monitor. Unless there is a monitor connected to the standard monitor port, the Monitors control panel cannot tell whether or not a television is connected to the S-video output port and automatically assumes that a television is present.

WARNING Do not attempt to move the menu bar to the "ghost" monitor. If you do, the menu bar will disappear, and you will not be able to restore normal video until you attach a monitor to the standard monitor port and reconfigure your Monitors control panel.

Follow these steps to restore normal video:

1) Shut down your computer.

2) Connect a monitor to the standard monitor port*.

*Note: If you are using the AudioVision monitor with the HDI-45 connector you will need to attach the AudioVision 14 Display Adapter cable to your monitor in order to connect it to the standard monitor port.

3) Turn on your computer.

4) Choose Control Panels from the Apple menu and open the Monitors control panel.

5) Verify that menu bar shows up on your primary monitor.

6) Close the Monitors control panel.

7) Turn off your computer.

8) Reconnect the monitor to the HDI-45.

9) Turn on your computer.

If you do not have the AudioVision adapter cable and/or another monitor that will plug into the DB-15 port of the AV card then you will need to use the following procedure to restore normal video:

1) Start up from the Power Macintosh CD.

2) Drag the "System" file from the "System Folder" of the hard drive and place it at the same level as the "System Folder" itself.

3) Copy the System file from the Power Macintosh CD into the System Folder on located on the hard drive.

4) Restart the system, hold the mouse button down to eject the Power Macintosh CD to allow the system to boot the machine from the hard drive.

5) Open Monitors control panel and verify that the menu bar is set to the primary monitor.

6) Restart the machine so that it starts up from the Power Macintosh CD.

7) Drag your original "System" file back into the "System Folder" on the hard drive.

8) Click "OK" when the dialog box appears asking to replace the "System" file.

9) Shut down the computer.

10) Reconnect the monitor to the HDI-45.

11) Restart the machine so that it boots to the hard drive.

LC 575: Screen Control Panel Won't Maintain Setting (5/94)

Revised: 5/10/94
Security: Everyone

LC 575: Screen Control Panel Won't Maintain Setting (5/94)

==========

Article Created: 9 May 1994

TOPIC ----------

Something strange happened with the Screen CDEV 1.0.2 on the LC Macintosh 575. When you set it, close the window and restart, the CDEV resets to default settings.

Our setup;

- Formatted drive
- New System 7.1 and enabler
- No Extensions
- No control panels except "Screen"

- Open the Screen CDEV and view: Checkbox is unchecked, and timeframe is default to 60 minutes. Hit the checkbox to activate the conservation mode, then select the timeframe to 15 mins before dimming occurs.

- Close window

- Restart

You will see that the Screen CDEV has reverted back to default settings.

This problem can be reproduced EVERY TIME.

- Intermittently even locking the CDEV fails to retain the settings too.

DISCUSSION ----------

Apple Engineering is aware of the situation and an updated version of the Screen control panel has been released, version 1.0.4.

This file fixes a PRAM conflict bug which occurs between the Screen control panel and the slot manager on LC 575 units. The Screen control panel used a

PRAM location assigned to the communications slot on the 575.

Version 1.0.4 is included in the System Update 3.0, which was announced in April. It will also be updated on the 575's CD Install Me First and system floppy disks.

TOPIC ----------

The Express Modem 1.5.2 READ ME says I need, "(GeoPort rev 1.2.1 or greater) provided with GeoPort disks" for Quadra 660AV and 840AV computers. Where can I get it?

DISCUSSION ----------

NOTE THE FOLLOWING CORRECTIONS TO THE EXPRESS MODEM 1.5.2 READ ME

- The Express Modem II Card is only available outside of the U.S. on PowerBook 500 Series computers.

New versions of Express Modem software have been released. The latest version of the Express Modem software is 2.3

What you should use

Apple released Apple Telecom software v2.3.2 which includes all the latest versions of extensions and communications software to use with all Apple PowerBook Express Modems, all Apple Comm Slot Express Modems, and Apple GeoPort Telecom Adaptors.

If you own a PowerBook 500 Series computer with a PC Card Modem, or PowerBook 5300 series, or PowerBook 190 series, you should install the Apple Telecom/PC Card Modem v2.3.1 software package.

The installer in both Apple Telecom software packages automatically places the correct software on your hard drive for your computer's configuration. Both versions of the Apple Telecom software packages are available on online services.

These articles can help you locate the Telecom 2.3.x software mentioned here:

• "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
10 Jan 1996 - Updated with Telecom 2.3.x information.
15 Dec 1995 - Updated with Apple Telecom 2.3 information.
19 Jan 1995 - Updated with current versions.

AV Monitors: Missing Part of the Sound Control Panel (10/95)

Revised: 10/5/95
Security: Everyone

AV Monitors: Missing Part of the Sound Control Panel (10/95)

==========

Article Created: 14 April 1994
Article Reviewed/Updated: 5 October 1995

TOPIC ----------

I have a 14" AudioVision monitor on a Power Macintosh and there are parts of the Sound Control Panel that are missing. Specifically, the AudioVision Speakers & AudioVision Headphones sliders (under Volumes in pop-up menu) and AudioVision Sound in pop-up menu.

DISCUSSION ----------

Both the AudioVision 14" Display and the AppleVision 1710 AV Display have their own processor chip which receives signal through the ADB channel in the monitor cable. Restarting the CPU may not clear the chip. The following steps should clear up this problem and restore the proper control panels settings and functionality:

Step 1

Shutdown CPU and monitor. Wait 30 seconds.

Step 2

Double-check monitor cable(s) for proper connection(s). Because the ADB signal is used by the monitor and the computer to determine configuration, you should connect the ADB devices this way: mouse to keyboard, keyboard to monitor, monitor to cpu.

Step 3

Next power up the computer first, and THEN the monitor.

Step 4

If problem remains, reset the PRAM by restarting the machine and holding down

the CMD-OPTION-P-R just after you hear the startup tones, and let go as soon as you hear them again.

Step 5

If problem still remains, system software (which includes the proper AV software) may be at fault. Options are to custom reinstall AV software or, follow steps for a clean install of system software on page 7 of "Additional Tips & Troubleshooting" addendum for Power Macintosh manuals.

The Video Control panel provides software control for brightness and contrast on the AudioVision 14" Display with System 7.1. In System 7.5, this control panel is replaced by the AppleVision Setup control panel which works on both AV monitors.

Power Macintosh: Speech Recognition Locks Up (4/94)

Revised: 5/27/94
Security: Everyone

Power Macintosh: Speech Recognition Locks Up (4/94)

==========

Article Created: 14 April 1994

TOPIC -----

The Power Macintosh seems to lock up right after turning on Speech Recognition.

DISCUSSION -----

Do the following:

1) Turn Speech Recognition off.
2) Check to see if Sound Out in Sound Control Panel is set to 44 KHz.
   If so, click 22 KHz setting.
3) Close Sound Control Panel and turn on Speech Recognition.

The Sound control panel should always be set to 22 KHz when using Speech Recognition. Setting Sound Out to 44.1kHz does not affect the audio off the CDs. Audio CDs just play through, the Sound Out settings are used for digital recording only.

Newton MessagePad: Special Symbols in the calling options (4/94)

Revised: 4/14/94
Security: Everyone

Newton MessagePad: Special Symbols in the calling options (4/94)

==========

Article Created: 14 April 1994

TOPIC -----

In the call slip under "options" (available when trying to dial the phone with Newton), what do "!" and ">" in the prefix area stand for?

DISCUSSION -----

The characters you reference are special dialing commands for accessing PBX systems. The exclamation symbol (!) is a flash hook command with a 2 second wait. It is used to wait for a clear line before initiating a call. The function is very similiar to a flash button on a phone set.

The greater than symbol (>) is a special symbol used on phone systems in Germany.

Newton MessagePad: Lithium batteries work well (4/94)

==========

Article Created: 14 April 1994

TOPIC --------------------

Do lithium AA batteries work with the MessagePad?

DISCUSSION --------------------

Lithium batteries work well in all current Newton MessagePad models. The main differences between Lithium batteries and standard alkaline batteries are battery life and cost. Lithium batteries are more expensive, however they also last longer.

Newton MessagePad: Meaning of Assistant's Where Field (4/94)

Revised: 4/14/94
Security: Everyone

Newton MessagePad: Meaning of Assistant's Where Field (4/94)

==========

Article Created: 14 April 1994

TOPIC ----------

When using the intelligent assistant with the datebook, what does the "where" field mean?

For instance, when I write "talk to Bill Clark Mon 12:00pm", the Newton presents several options for the WHERE field in the scheduled meeting slip. Most of the options at least have the letters M and O. One options name is Monica and another is Mozgia. How does the Newton MessagePad determine what should be offered in the choice list for where?

DISCUSSION ----------

The assistant uses the name information stored in your Newton MessagePad to determine the where field contents when scheduling a meeting. This is because the names information can also be used to store locations.

First, the Newton MessagePad searches the names database on each word for the "who" field list. The Newton MessagePad also searches names for the "where" list. "Where" searches also look in the notes fields of the name cards. That is why the "where" list can contain some strange entries.

For instance, when I enter "Schedule meeting with Steve on Monday" on my Newton MessagePad, it put Electric in the "where" field because I had written the word "Monday" in the notes for my electric company name card. The Newton MessagePad is being as complete as it can by giving you the broadest range of options for "who" and "where."

Power Macintosh 8100AV: Video Out Choices (4/94)

Revised: 4/15/94
Security: Everyone

Power Macintosh 8100AV: Video Out Choices (4/94)

==========

Article Created: 15 April 1994

TOPIC -----

A customer has a monitor connected to the S-Video port on his Power Macintosh 8100/80 AV. He gets two options for 640x480; 640x480 (NTSC - TV only) & 640x480 (NTSC) and wants to know the difference.

DISCUSSION -----

The reason that the S-Video output to your monitor allows you two choices at the same resolution is because of convolution. The NTSC-TV selection provides convolution and the NTSC selection does not.

Using the NTSC-TV option will provide a raster with substantially less jitter than with the NTSC option.

As far as not being able to see the menu bar is concerned, the reason is due to being in the overscan mode. Select a reduced resolution (underscan mode) and you will see the menu bar.

QuickTake 100: Some TWAIN Support (2/95)

Revised: 2/6/95
Security: Everyone

QuickTake 100: Some TWAIN Support (2/95)

==========

Article Created: 19 April 1994
Article Reviewed/Updated: 3 February 1995

TOPIC ----------

Is the QuickTake 100 camera TWAIN compliant?

DISCUSSION ----------

The QuickTake camera and software are not TWAIN compliant using the Macintosh OS at this time and there are currently no plans to make it compliant. Microsoft Window users can use a third party product called PhotoNow by PictureWorks Technology.

However, the QuickTake camera already provides TWAIN-like functionality.

The QuickTake software lets you download pictures that are already stored in the camera, while in any application that opens or imports PICT files. This can be done by connecting to the QuickTake camera using the QuickTake Setup control panel. An icon representing the camera shows up on the desktop just like any other disk. Once this is done, the user's application can open QuickTake image files like it would any other PICT file. For example, MacWrite Pro can use its "Insert..." command to place a QuickTake image into a document.

Explanation of TWAIN

One apparent advantage of TWAIN is that TWAIN-compliant programs let you scan images directly from the application. This is not applicable to the camera that is not attached to the CPU when acquiring an image.

TWAIN is an API standard for scanners that provides across-the-board compatibility between scanners and software. The specification's open industry interface lets hardware developers and applications programmers support a wide range of devices by writing one standard device driver.

Users also benefit from the spec because it lets them directly acquire images

from within TWAIN-compliant software applications, including word processors, spreadsheets, and desktop-publishing programs.

A cross-platform API, TWAIN works with both Windows 3.1 and Macintosh System 7. Windows NT support for TWAIN is in beta testing by developers for 32-bit applications.

The TWAIN specification was developed by the Working Group for TWAIN, a consortium of hardware and software vendors that includes Aldus Corp., Caere Corp., Eastman Kodak Co., Hewlett-Packard Co., and Logitech, Inc.

To locate a vendor's address and phone numbers, use the vendor name as the search string.

PowerTalk: Using With Power Macintosh Upgrade and 68K Mac (4/94)

Revised: 4/20/94
Security: Everyone

PowerTalk: Using With Power Macintosh Upgrade and 68K Mac (4/94)

==========

Article Created: 15 April 1994

TOPIC ----------

Is it possible to install a Power Macintosh Upgrade Card and its software along with PowerTalk for Power Macintosh and utilize PowerTalk when using the 68040 processor instead of the PowerPC 601 processor?

DISCUSSION ----------

Here are steps required to facilitate the proper installation and usage of PowerTalk under both 68K and Power Macintosh modes.

0) (OPTIONAL, but recommended) Install a clean version of System 7.1.
1) Install the Power Macintosh Upgrade Card Software.
2) Install System 7 Pro (Boot off the System 7 Pro Install Me First disk).
3) Install Rev. 2 of the PowerTalk for PowerMacintosh Software.
4) Restart.

All three steps are required to utilize PowerTalk features in 68K and Power Macintosh modes. Though the process is rather convoluted currently, the process will be smoothed out with the advent of System 7.5 later this year.

LaserWriter Pro 810: Startup Page and Printer Name (4/94)

Revised: 4/15/94
Security: Everyone

LaserWriter Pro 810: Startup Page and Printer Name (4/94)

==========

Article Created: 14 April 1994

TOPIC ----------

The startup page doesn't reflect the correct printer name. The printer has been named LW Pro Room 218, the test page says LW Pro 810f. If I check the name with the LW Utility it shows the correct name. The correct name also appears in the Chooser of all Macintosh computers. The correct name was on the test page but we had big problems with the printer and had to reset it to factory defaults. Since then I cannot get the test page to show the correct printer name. How can I force the printer to print the correct name on the test page?

DISCUSSION ----------

The start up page reflects the name assigned to the LocalTalk side of the printer. Due to the I/O architecture of this printer it was not possible to set the LocalTalk name from the EtherTalk side and vice versa. To have the start up page reflect the correct name simply connect to the printer with LocalTalk and use the LaserWriter Utility to rename it.

Power Macintosh: Memory Does Not Add Up Under About This Mac

Revised: 4/15/94
Security: Everyone

Power Macintosh: Memory Does Not Add Up Under "About This Mac"

==========

Article Created: 15 April 1994

TOPIC -----

When I check the memory allocation under "About this Macintosh", it doesn't add up to the amount of RAM installed, even after restarting. On an 8MB Power Macintosh 8100/80, the System Software has 3154K allocated, and the largest unused block is 2192K so almost 3 MB RAM is missing.

DISCUSSION -----

The available memory calculation is an estimate at best and should never be used as the last word on how much memory is actually allocated or in use.

There have been cases where an Extension conflict or corruption have caused the memory shown to be less than is actually installed. Booting with Extensions off should be the first step in this process. If the memory allocation is correct you should then verify compatibility with any Extension installed.

If that does not resolve the problem, the next steps towards resolution would be zapping PRAM by holding down the Command/Option/P/R keys at startup. Updating the driver on the hard drive would be next and finally a clean reinstallation of system software should resolve the problem.

DOS Compatible Card: Copying & Pasting Problems (4/94)

Revised: 4/18/94
Security: Everyone

DOS Compatible Card: Copying & Pasting Problems (4/94)

==========

Article Created: 15 April 1994

TOPIC --------------------

When I try to copy or cut anything more complicated than a couple of lines of text from Windows or DOS to a Macintosh application, the machine either locks up at the "translating clipboard box," or nothing shows up in the clipboard. I have a brand-new system straight out of the box. What's wrong?

DISCUSSION --------------------

The problem is memory related - there's not enough Macintosh memory for the translation. Sometimes this is handled gracefully, as when there's nothing in the clipboard, and sometimes the machine will crash when out of memory. If purchasing more memory is not an option, then turn Virtual Memory on and restart. Virtual Memory should be no greater than double the total amount of physical RAM. For example, on a machine with 8 MB physical RAM, Virtual Memory should be set to no more than 16 MB.

Upgrading Newton: Recognition Tip (4/94)

Revised: 4/18/94
Security: Everyone

Upgrading Newton: Recognition Tip (4/94)

==========

Article Created: 15 April 1994

TOPIC -----

This article describes a tip for better handwriting recognition when upgrading from a Newton MessagePad to either the MessagePad 100 or Messagepad 110.

DISCUSSION -----

After restoring your data from your Newton Messagepad to your MessagePad 100 or MessagePad 110, go to the preferences section and reset your letter styles training.

You can do this by choosing Preferences in the Extras drawer, choosing Letter Styles, and tapping on "Return to original settings.” Your recognition should be better than it was on the old unit even with the 'old' training data.

DOS (486) Compat Card: Frequently Asked Questions (3/97)

Revised: 3/14/97
Security: Everyone

DOS (486) Compat Card: Frequently Asked Questions (3/97)

==========

Article Created: 15 April 1994
Article Reviewed/Updated: 14 March 1997

TOPIC ----------

These are frequently asked questions (FAQ) about the DOS Compatibility card.

Questions in this FAQ:
==========

1) Is the socketed 486SX processor upgradable?

2) How do I capture the screen from DOS without a mouse?

3) Does the PC board maintain it's own clock?

4) What is the purpose for the unused connector on the DOS Compatibility Card?

5) Why do the video driver disks install a 1024X768 video driver in Windows? Is it supported?

6) What is the required speed of the SIMMs for the card?

7) Will Virtual Memory allow me to allocate more memory to the DOS card?

8) Are disk compression programs such as Disk Doubler, Spacemaker and DOS's Doublespace supported?

9) Will DOS disks be included with the purchase of this product?

10) How do I use my Apple Keyboard II? It doesn't have any function keys?

DISCUSSION ----------

1) Question: Is the socketed 486SX processor upgradable?

Answer: No, a 486DX chip at the same clock speed could be inserted with a few minor modifications to the board but is not supported by Apple.

2) Question: How do I capture the screen from DOS without a mouse?

Answer: Use the arrow keys to move the cursor to the desired location, and hold the shift key down when marking the region. Let go of the shift key and the marked region will be captured.

3) Question: Does the PC board maintain it's own clock?

Answer: No. The PC card polls the Macintosh at startup for the correct date and time. If the date and time are changed with the DOS date and time commands they will be reset when the Macintosh is restarted.

4) Question: What is the purpose for the unused connector on the DOS Compatibility Card?

Answer: This connector is actually a subset of the PC ISA bus. It was designed specifically for possible future enhancements, but has no real use at present.

5) Question: Why do the video driver disks install a 1024X768 video driver in Windows? Is it supported?

Answer: The video driver disks have not been modified for Apple's use and were provided by CHIPS & Technology. The DOS Compatibility Card only has 512K of VRAM and supports a maximum resolution of 800X600.

6) Question: What is the required speed of the SIMMs for the card?

Answer: 80ns or faster.

7) Question: Will Virtual Memory allow me to allocate more memory to the DOS card?

Answer: No, the DOS Compatibility Card only sees physical memory.

8) Question: Are disk compression programs such as Disk Doubler, Spacemaker and DOS's Doublespace supported?

Answer: Apple recommends that the customer don't use DOS's Doublespace even though it appears to work. There are no known compatibility issues with Macintosh compression programs. DOS Doublespaced containers will appear empty except for command.com when mounted from the Macintosh finder.

9) Question: Will DOS disks be included with the purchase of this product?

Answer: Yes.

10) Question: How do I use my Apple Keyboard II? It doesn't have any function keys?

Answer: Page 13 in the DOS Compatibility Card manual describes how to do this The OPTION key in combination with a number corresponds to function key of the same number.

PowerBook: Problems Waking From Sleep or Dimming (6/96)

Revised: 6/6/96
Security: Everyone

PowerBook: Problems Waking From Sleep or Dimming (6/96)

==========

Article Created: 18 April 1994
Article Reviewed/Updated: 5 June 1995

TOPIC ----------

This article provides some troubleshooting tips for a PowerBook that enters a dimmed state or that freezes up while it is waking up from sleep.

DISCUSSION ----------

Software
========

Step 1

See if the PowerBook has gone to sleep with an external monitor attached.* Select "Don't sleep" when plugged into AC. Always use the AC Adaptor when external devices are attached to a PowerBook.

* NOTE: Some software applications may not "understand" the PowerBook sleep function. If you discover your PowerBook always freezes when it goes to sleep if a certain application is open, you should contact the software vendor for more information.

Step 2

Check for SCSI driver problem. Some possibilities:
• SCSI driver is not system 7.x compatible
• SCSI driver is corrupt (Update with HDSC Setup for Apple Drives)

Step 3

Check to see if incompatible software is installed. Some possibilities:
• Screen Savers
• security software

To test for incompatibility, remove the software and then get an update if the removal solved the problem.

Step 4

Check for older third party products, which should be updated. Consult third party developers for updates.

Step 5

Reset PRAM by holding down COMMAND-OPTION-P-R after the startup tones. Once you hear the tones again, release the keys.

If none of the preceding steps help, the System may be corrupt. Perform clean install and run Disk First Aid (See Clean Install article).

Software and Screen Dimming

If the PowerBook has an external display attached and dims the display, some programs lock up when the PowerBook tries to use the external monitor again. The solution is to set the PowerBook not to dim when plugged in. Since the PowerBook must be plugged in to use the external display this should solve the problem.

If the PowerBook is running System 7.0.1 or 7.1, then this setting is in the PowerBook Display control panel. If the PowerBook is running System 7.1.1, 7.5, or has v1.5 or later of the Express Modem software, then the setting is in the PowerBook control panel. The PowerBook control panel must be set to Custom, the Power Conservation at the bottom of the control panel must be set to Power Adapter, and the slider marked Screen Dims should be moved to Never.

With the PowerBook configured this way, it still dims the built-in display when running off of battery power and should not diminish the amount of time that you can expect to get out of a battery charge.

Potential Hardware Problems

Possible hard drive failure
Update SCSI driver, run Disk First Aid and HDSC setup test, and reformat the drive if HDSC Setup finds errors.

Hard drive cable
If a new hard drive has been installed, the cable may need replacement.

Possible logic board failure
Check with an Apple Authorized Reseller for a replacement or repair.

This article was published in the "Information Alley":
Volume II, Issue 1, Page 16

Article Change History:
05 Jun 1996 - Added note on software apps and screen dimming.
03 May 1995 - Added keyword; made several technical updates.

Newton MessagePad: Caps Lock Appears As Line On Screen (4/94)

Revised: 4/18/94
Security: Everyone

Newton MessagePad: Caps Lock Appears As Line On Screen (4/94)

==========

Article Created: 14 April 1994

TOPIC -----

When I am in the date application, there is a intermittent line in the top left corner of the screen. It's appearance has no effect on any operations. What does it do?

DISCUSSION -----

The line that appears at the top of the screen is a Caps Lock indicator. On the "soft" keyboard, if Caps Lock is left on, the small line appears in the upper left corner of the screen. In the notepad and names applications, the line gets hidden because windows on the screen cover it.

Revised: 4/19/94
Security: Everyone

Newton Connection Kit: No Export Into ClarisWorks Database 4/94

==========

Article Created: 18 April 1994

TOPIC -----

Does the Newton Connection for Macintosh support import/export of data from ClarisWorks database files?

DISCUSSION -----

The Newton Connection File does not support a direct translation into the ClarisWorks database module. The ClarisWorks database can export data as tab delimited text, so you can use the Newton Connection Kit to create an import/export option for ClarisWorks.

The ClarisWorks database module cannot import text data into a database file, so you cannot export data from the Newton MessagePad into a ClarisWorks database file.

Power Macintosh: NTSC Video Out Choice & Menu Bar Missing (2/96)

==========

Article Created: 18 April 1994
Article Reviewed/Updated: 22 February 1996

TOPIC ----------

I have an NEC monitor connected to my Power Macintosh 8100 AV system with the monitor connected to the S-Video port. I have two options for 640x480; 640x480 (NTSC - TV only) & 640x480 (NTSC).

What is the difference?

I also have a Power Macintosh 8500 with 4 MB of Video RAM (VRAM), a Multisync 15 inch display, and a 27 inch television set. I am attempting to use the highest resolution (800x600) available for both the monitor and television set. I am mirroring the computer's monitor onto the television screen.

I cannot see the menu bar on the NEC display or the TV in either of these setups. What is wrong?

DISCUSSION ----------

NTSC Options

The reason that the S-Video output from your Power Macintosh 8100 to your NEC monitor allows you two choices at the same resolution is because of convolution.

- The NTSC-TV selection provides convolution.

- The NTSC selection does not provide convolution.

Using the NTSC-TV option will provide a raster with substantially less jitter than with the NTSC option.

Missing Menu Bar

As far as not being able to see the menu bar is concerned, it is because you are in the overscan mode. Select a reduced resolution (underscan mode) and you will see the menu bar.

NTSC (S-Video) video output has different capabilities when compared to standard RGB display output. NTSC output on the Power Macintosh 8500 series computers only supports resolutions up to 640x480 output. In resolutions at 640x480 and above, the menu bar will disappear and the picture will appear to go off the sides of the screen. This is called overscan mode.

Apple does provide lower resolutions that better match the capabilities of NTSC. These are 512x384 and 320x240. Both resolutions will show the whole display area and the menu bar will not be cropped. This is because the conversion from RGB resolution to NTSC scan lines better match the capabilities of NTSC devices in these resolutions.

In fact, 320x240 is an excellent resolution to use for outputting QuickTime video. The computer can playback video faster at 320x240 resolution and the Power Macintosh 8500 series computer's hardware will optimize playback at 320 to fill an entire NTSC video screen.

Chinese Language Kit:PC Exchange & Freeze w/ Disk Format (5/96)

==========

Article Created: 18 April 1994
Article Reviewed/Updated: 27 May 1996

TOPIC -----

I use a Quadra 840AV with the Chinese Language Kit and PC Exchange 1.0.3. When I try to format a floppy disk, the machine hangs or does not complete the formatting process.

DISCUSSION -----

There is a known conflict between PC Exchange 1.0.3 and the Chinese Language Kit. Apple has corrected this problem in PC Exchange 1.0.4. PC Exchange 1.0.5 is the current version which is also compatible with all the Power Macintosh computers.

All existing PC Exchange customers can call the Apple Order Center for an update to version 1.0.5.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

MacCheck: RAM Doubler Caused ROM Check to Fail (4/94)

==========

Article Created: 18 April 1994

TOPIC ----------

When I run MacCheck on my Performa 550, the ROM check failed and Logic Board test failed.

DISCUSSION ----------

You probably have a third party extension such as RAM Doubler that patches the ROM code. Start with Extensions off by holding down the Shift key after choosing Restart. Then run MacCheck again. It should not report a problem.

RAM Doubler patches the ROM which causes the Checksum to no longer match. This will cause the error in MacCheck.

Dell Crosswords: Removing puzzle data (4/94)

==========

Article Created: 18 April 1994

TOPIC ----------

Once a puzzle is completed in Dell Crosswords on a PCMCIA ROM card, how do you clear the puzzle so that it can be played again by another player?

DISCUSSION ----------

The steps for removing data from a puzzle are listed below. You may want to erase the data to save internal memory space in addition to removing it to let someone else play the puzzle. You save internal memory space because the PCMCIA ROM card stores the solutions and scores on internal Newton memory.

Puzzle data can be removed by following these steps:

1) Navigate to a puzzle pack screen which contains a list of available puzzles. The Dell Crosswords PCMCIA card comes with 13 different puzzle packages. The top of the screen displays "Contents of Dell CW Pack #Cx", where x is the number of the puzzle pack.

2) Tap once on the puzzle you want remove the data from.

3) Tap on the Cleanup Data button.

4) Tap on the Remove data for this pack button.

Newton MessagePad: Preventing Early Alarms For Events (4/94)

Revised: 4/18/94
Security: Everyone

Newton MessagePad: Preventing Early Alarms For Events (4/94)

==========

Article Created: 18 April 1994

TOPIC -----

This article describes a workaround that prevents alarms for repeating events in the Newton Datebook from going off early.

DISCUSSION -----

Sometimes Datebook alarms go off days, weeks, or months early. But, if events are created in a specific order, then the alarm for these events is not activated prematurely.

When creating the repeating event, create the item in the following order:

1) Create the meeting or day note
2) In the event slip, set the Alarm
3) Set the Frequency

Make sure you set the Alarm before you set the Frequency. If you set the frequency first, the alarm for the event may go off early.

Express Modem 1.5.1: Default Profile of atN from 0 to 1 (4/94)

Revised: 6/17/94
Security: Everyone

Express Modem 1.5.1: Default Profile of atN from 0 to 1 (4/94)

==========

Article Created: 1 April 1994

TOPIC ----------

One of the changes in Express Modem software from 1.1.2 to 1.5.1 was to change the default factory profile of atN value from 0 to 1.

DISCUSSION ----------

The change of the default factory profile of atN value from 0 to 1 effects users who are using an S37 command. What this means is if you need to force connect at a speed less than 14.4, for example when calling America Online (AOL), you have to add "n0" (N-Zero) to your initialization string. The initialization string we have been using for AOL includes setting S37 to 6 to force the connection at 2400 bps. "n1" causes the modem to ignore the value in S37.

Power Macintosh: SoftWindows, NetWare, Token Ring (5/94)

Revised: 5/23/94
Security: Everyone

Power Macintosh: SoftWindows, NetWare, Token Ring (5/94)

==========

Article Created: 4 April 1994
Article Reviewed/Updated: 20 May 1994

TOPIC ----------

I've looked at Power Macintosh in my environment which includes a Token Ring network with both Windows and Macintosh computers, mainframe access, and NetWare (including NetWare for Macintosh).

I've seen a Power Macintosh 7100/66 with the Apple Token Ring 4/16 NB Card. Everything worked fine where TokenTalk connected to NetWare volumes with NetWare for Macintosh, we accessed the mainframe with MacMainFrame, and we accessed the Internet with MacTCP and MacTCP Token Ring.

With SoftWindows I could access applications from a mounted NetWare volume through SoftWindows' Shared Volumes feature. Finally I wanted to login to NetWare via IPX. The SoftWindows README said IPX is supported on Token Ring, provided the card is written to Apple Computer's .TOKN specifications.

I launched NetWare, and did login by typing 'token', and various drivers loaded, LSL, tokenspc, ODI, and so on. NETX launched to attach to the server, but the process failed with the message, "Can't find network server."

What do I need to make this work?

DISCUSSION ----------

The issue is the ability of an Apple Token Ring card and associated driver to send and receive SPX packets. SPX packets are the 802.2 version of Novell's IPX packet format whereby the SAP is 0xE0 as opposed to 0xFF. Novell has gotten around this problem with MacIPX by manipulating the Token Ring driver directly.

The Token Ring drivers on the NSI 1.4.5 disk make it possible for both the Apple Token Ring 4/16 NB Card and the Apple Token Ring NB/c Card to send and receive SPX packets as well as other packets types that have non-SNAP SAPs. The API is identical to Ethernet Card API.

These drivers are what we would call "dumb" drivers. In the case of the Apple Token Ring 4/16 NB Card driver, the 68000 processor on card is not used at all. This is a good thing for most situations. The driver is faster than the old driver and has an added benefit of not putting the card in bus master mode. The only caveat here is the dumb driver does not work with the SNA•ps Gateway product. A "smart" driver is included on the NSI 1.4.5 disk just for the SNA•ps Gateway product which puts the card in bus master mode.

Another issue to note here is that it's not possible to have the "dumb" and "smart" drivers for the Apple Token Ring 4/16 NB Card installed and used at the same time. If both drivers are installed, the "smart" driver will be used.

The Apple Token Ring NB/c Card is never in bus master mode and has only one driver. This driver does not support the SNA•ps Gateway product at this time.

AppleShare File Server Software Will Not Start (11/96)

Revised: 11/13/96
Security: Everyone

AppleShare File Server Software Will Not Start (11/96)

==========

Article Created: 14 April 1994
Article Reviewed/Updated: 13 November 1996

TOPIC ----------

After turning on the AppleShare File Server and the message, "Starting AppleShare File Server. This may take a few minutes.", is displayed, but the file server never becomes active. What is wrong?

DISCUSSION ----------

If the invisible AppleShare PDS file becomes corrupted the AppleShare File Server software will not be able to start. You will need to remove the invisible AppleShare PDS file from the root level of the hard disk being shared and allow AppleShare to build a new PDS file.

If you are using a Macintosh other than a Workgroup Server 95, please refer to Technical Information Library article, "AppleShare & System 7.x.x: Removing a Corrupt PDS File," for information on removing a corrupted PDS file.

Apple Workgroup Server (AWS) 95

To create a new AppleShare PDS file on a AWS 95 running A/UX, follow the steps below:

IMPORTANT: All access privileges information will be lost. If you proceed with the following steps, access privileges will have to be recreated using the AppleShare Admin application.

Step 1
From the Apple Menu Open the Command shell. If a window does not appear then open a new window via the File pull down menu.

Step 2
Type in "pwd" to confirm you are in the / directory. If not, type in the command "cd /" and press the return key.

Step 3
Type "ls" and press the return key to view the files. Use the scroll bar to scroll to the top of the display until you see the AppleShare PDS file.

Step 4
Use the command 'mv /"AppleShare PDS" temppds' to rename the PDS file.

Step 5
Do another "ls" command to be sure the file has been renamed.

Step 6
Restart the AWS 95 and launch AppleShare Pro.

A/UX 3.1: Maximum UFS Partition Size (4/94)

Revised: 4/20/94
Security: Everyone

A/UX 3.1: Maximum UFS Partition Size (4/94)

==========

Article Created: 20 April 1994

TOPIC -----

I understand that A/UX 3.1 would support UFS partitions up to 4 GB. Is it true or is it still 2 GB as the limitation for an UFS partition?

DISCUSSION -----

The latest version of A/UX 3.1 (the version used on the Workgroup Server 95) can support up to a 4 GB Unix UFS file system. However, the HFS limit for an AppleShare Pro volume is still limited to 2 GB.

NOTE (from the A/UX 3.1 ReadMe file):

Limit on File System Check Command

When the Apple Workgroup Server 95 starts up, the fsck command is run from the A/UX Startup application. It CANNOT check a file system larger than 2 GB. Therefore, limit the size of your root file system to 2,097,151 KB so that the root file system can be checked at system startup. Once A/UX is running, the fsck command can check file systems as larger than 4 GB.

Installing 810 Software on Sparc Station (4/94)

Revised: 4/20/94
Security: Everyone

Installing 810 Software on Sparc Station (4/94)

==========

Article Created: 20 April 1994

TOPIC ----------

Software installation fails when installing on a Sun Sparc Classic running Solaris 2.2. Software installs properly on a Sun Sparc 10 model 41 running SunOS.

DISCUSSION ----------

There was a minor problem with the first release of LaserWriter Pro 810 enstall utilities for compiling the codes on SunSparc station running Solaris 2.2 or 2.3. There is a newer version which is available. Users should run the "enstall" with the -b option to install on the system without compiling the codes.

The LaserWriter Pro 810 Utilities with pre-compiled executable binaries for Sun Solaris 2.2 or 2.3 has been posted to on-line services.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates
- Obtaining Apple Product Support in the USA
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

It is also available in ftp.support.apple.com via Internet anonymous ftp.

LaserWriter 8 Driver: Printing Always Uses Hard Drive (5/95)

Revised: 5/19/95
Security: Everyone

LaserWriter 8 Driver: Printing Always Uses Hard Drive (5/95)

==========

Article Created: 20 April 1994
Article Reviewed/Updated: 3 May 1995

TOPIC ----------

You may not think that printing is in any way related to the amount of hard disk space you have available, but when you are using the LaserWriter 8.x printer driver it is a factor to consider. Even if you have a lot of hard disk space available, it may not be enough to print a very large file.

DISCUSSION ----------

LaserWriter driver 8.x actually spools the entire job to disk regardless of whether or not background printing is enabled or disabled; this is different from previous drivers. It does this to perform analysis on the print job while it is being spooled (first pass).

During the second pass (where the QuickDraw code gets converted to PostScript), it uses the data analysis from the first pass to optimize the PostScript code it generates.

LaserWriter driver 8.x performs the following types of analysis:

- Font analysis
- Image analysis
- Pattern analysis
- Bounding box accumulation
- Text measurement

In foreground printing, the performance penalty is negligible for typical short printing jobs, and is outweighed by the performance gains resulting from PostScript code optimization.

It is possible, however, that large foreground printing jobs may incur significant penalties, in both processing time and disk space, as a result of the separate spool pass.

Workarounds

The only workarounds to the problem are to free up space on the hard drive or use an older version of the LaserWriter driver, such as v7.2, and print in the foreground.

QuickDraw GX also uses a two-pass driver, so it also needs free space on the hard drive to print files.

LaserWriter Select 360: Fax Speed (4/94)

Revised: 4/21/94
Security: Everyone

LaserWriter Select 360: Fax Speed (4/94)

==========

Article Created: 20 April 1994

TOPIC ----------

What's the specifications for the fax speed on the Laser 360f?

DISCUSSION ----------

The LaserWriter Select 360 and LaserWriter Pro 810 PostScript Fax Cartridges follows the CCITT (International Telephone and Telegraph Consultative Committee) Group III transmission standard of up to 9600bps.

Each time a facsimile device attempts to establish a connection, a training signal will be transmitted from the sending device to the receiving device. If impairments on the line cause the receiving device to get errors in the training signal, the receiving device will signal the transmitting device to repeat the training signal at a lower baud rate. This repeats until the receiving device receives an error-free training signal or, if the receiving device does not receive an error-free signal at every baud rate (9600bps, 7200bps, 4800bps and 2400bps), the transaction will be terminated.

Additional attempts to establish a connection will be attempted if you have requested so in the Fax Options dialog box: in the "Maximum number or retries" box, type the maximum number of times, 0 to 100, the fax software should redial the fax number of if it cannot connect.

Failures to connect at any baud rate due to impairments on the telephone line should be brought to your telephone service provider's attention.

LaserWriters: Printing 2-byte Languages/Characters (4/94)

Revised: 5/24/94
Security: Everyone

LaserWriters: Printing 2-byte Languages/Characters (4/94)

==========

Article Created: 19 April 1994

TOPIC --------------------

We want to use third-party Chinese fonts which require a 2-byte printer. We were told the LaserWriter 810 is 1-byte and won't work. Is the Apple LaserWriter Pro 630 1-byte or 2-byte, and specifically what does this mean?

DISCUSSION --------------------

If the Chinese fonts are TrueType then printer type is not an issue as the fonts will work with all Apple printers, and prints well on a QuickDraw printer (StyleWriter). The best printers to use are the ones with the TrueType interpreter in the ROMs:

- LaserWriter IIf/IIg
- LaserWriter Pro 600/630
- LaserWriter Select 360
- Personal LaserWriter NTR
- Personal LaserWriter 320

The LaserWriter Pro 630 supports composite fonts but has not been tested nor optimized for use with third party composite fonts (on a hard disk); the same holds true for the LaserWriter Pro 810. Apple released a Kanji version of the LaserWriter Select 360 optimized for printing Kanji characters. This printer is available in Japan and may be something you should look into. The entire system (printer, hard disk, fonts) has been tested and optimized. The main difference between the Kanji optimized printer and one bought in the United States is the speed in which documents print. In terms of the specific printer suggested by the font supplier, the same requirements above hold true for that printer.

Explanation of 1-byte and 2-byte

The difference between a "1-byte" or "2-byte" printer can be summarized by whether or not the printer supports composite font technology. Thus, the LaserWriter Pro 630 and 810 can both be considered "2-byte" printers, however,

there are various other requirements for printing large character sets such as Chinese or Japanese.

These requirements are as follows:

- The printer must support composite font technology. PostScript Level 2 has built-in support, though there are some PostScript Level 1 implementations that have the composite font extensions (that is, LW NTX-J). As stated in the "PostScript Language Reference Manual" from Adobe, "A composite font is a collection of base fonts organized heirarchically."

  This basically means that instead of the typical 1-byte-per-character mapping when using a single base font (1 byte = 256 characters), the usage of multiple base fonts allows for a 2-byte-per-character mapping to represent up to 65,536 characters.

- The composite fonts themselves must have some intelligence built-in. The "daughter" fonts need to have some instructions to access their glyphs from storage (that is, instructions to access the hard drive where the glyphs reside).

- A hard disk of composite fonts, supplied with the printer. Since one composite font takes up a large amount of memory (for example, 7MB), the fonts need to reside on a hard drive, as opposed to being downloaded or in RAM.

- The printer should be designed and tested for use with composite fonts. Generally, any PostScript Level 2 printer processes composite fonts, but without any design changes or testing there could be some serious bugs and/or poor performance. Some of the most important design changes are ones such as font caching or file system utilization to handle the large amounts of font data.

HyperCard: Apple Videodisc Drivers (4/94)

Revised: 4/20/94
Security: Everyone

HyperCard: Apple Videodisc Drivers (4/94)

==========

Article Created: 20 April 1994

TOPIC --------------------

I have been told that there is a videodisc driver that is made by Apple that I can use with the NEW HyperCard 2.2. Where do I get it? I have both Sony and Pioneer players -- does it give you a choice of laserdisc players?

DISCUSSION --------------------

Neither Apple Computer nor the Apple Programmers and Developers Association carry video disc drivers any longer. However, third party developers such as the Voyager Company in New York and Objectic Systems in Renton Washington carry videodisc drivers compatible with HyperCard 2.2 and work with a variety of laserdisc players. Search on the company names for address and phone information.

QRG: LW Pro 810 Installation on UNIX Based Hosts (5/94)

Revised: 5/11/94
Security: Everyone

QRG: LW Pro 810 Installation on UNIX Based Hosts (5/94)

==========

Article Created: 11 May 1994

TOPIC ----------

This article is the LaserWriter Pro 810 Quick Reference Guide, Installation on UNIX Based Hosts.

DISCUSSION ----------

Who should read this guide: This Quick Reference Guide is designed to assist the person responsible for installing the LaserWriter Pro 810 and configuring it to work on a customer's network. This guide assumes a high level of knowledge in the areas of Unix administration and TCP/IP network administration. This guide is designed to act as a pointer to the "LaserWriter Pro 810 Printer Server Installation and Configuration Guide," it is not meant to replace it.

1) Due to the additional networking protocols supported by the LaserWriter Pro 810, this printer is different than any other Apple LaserWriter you have seen before, we highly recommend that you become thoroughly familiar with the printer before attempting to install it at a customer site. If you are installing the LaserWriter Pro 810 on a network that you do not normally administer you should familiarize yourself with the target environment and have answers to questions such as:

   • What OS is being used?
   • Will the connection be 10 base 2 (BNC) or 10 base T (RJ-45)?
   • What is the configuration of the host CPU?

   You WILL need a C compiler and linker on at least one host for each type of system on which the utilities will be installed.

2) The LaserWriter Pro 810 does NOT have an IP address in firmware when it is shipped from the factory, it must be assigned as part of the installation procedure. There are two ways to set the IP address of the printer, Remote Address Resolution Protocol (RARP) and Remote Console Facility (RCF).

a) Using the RARP protocol. Many network administrators will not allow RARP to work as a permanent solution to assign an IP address. They may allow you to use it temporarily to set the printer's IP address. You can use the existing network to assign the IP address for the first time using RARP and then go in to the RCF and make the address permanent. If you are unable to run RARP on the network you will need to set up a separate two node network. (See Part 1, Section 2.3.3).
   NOTE: A/UX does not include RARP. You must either use method a) above or find a public domain RARP that can be used with A/UX.

b) Accessing the Remote Console Facility (RCF) by using the RJ-12 maintenance port, (see Part 1, Section 2.3.2). The default Super User password is SYSTEM, (you need this when you use "su" to get into Super User mode). This password is needed when using the maintenance port and Telnet. This option requires a unique RJ-12 to mini DIN-8 cable.

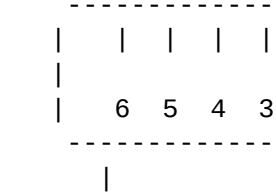
Cable information is located in Part 1, Appendix A of the LaserWriter Pro 810 Printer Server Installation and Configuration Guide; to save you time, the pin assignments for a LaserWriter Pro 810 to Macintosh cable are shown later in this document.

Pin 1 is the pin on the far right of the male RJ-12 connector on the cable and on the far left side of the female RJ-12 connector on the printer. The numbering scheme for the male 8 pin Macintosh connector is also shown below:

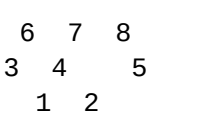
Connector Reference:
RJ-12 is the LaserWriter Pro 810 Maintenance Port, Mini DIN-8 is the Macintosh Serial Port

RJ-12 Connector		DIN-8 Connector	
Signal name	Pin	Pin	Signal name
TxD-	2 <->	5	RxD-
RxD-	5 <->	3	TxD-
GND	3 & 4 <->	4, 6 & 8	GND
DTR	1 <->	2	CTS
CTS	6 <->	1	DTR

RJ-12 Plug Connector



DIN-8 Plug Connector



Note:
Pin 1 is on the right side of the connector.

Notes:
Shown looking at pin side of connector. Note Space between pins 4 and 5.

3) The bootp protocol can be used to load upgraded printer server firmware. This requires a binary image of the ROMs which Apple is not providing at this time since the firmware in ROM is the latest version available. As a result of this you can disregard all references to using bootp in the "LaserWriter Pro 810 Printer Server Installation and Configuration Guide" at this time.

4) Copy the utility software onto the host and run the install program (see Part 3, Section 2.2). You will be presented with a startup screen informing you that in order to use one of the three options (-b, -m, -u) you must quit and restart the program. The first time you run install you should run it without any of the options selected. You will use the -m option to modify virtual printers after the initial installation. The -b option will be used if the utilities were compiled on another system. At this time there is no software upgrade so the -u option is not needed.

5) If you plan on compiling the utilities on a system other than the host where the utilities will actually be used See Part 3, Section 2.4.

6) For the initial installation use the default values presented by the install program. These can be modified at a later time if necessary.

7) The Remote Console Facility (RCF) can also be accessed via Telnet once the printer's IP address has been set. The default password for the RCF over Telnet is access, See Part 3, Section 4.2, 5.2 or 6.2.

8) If you plan on using the RCF extensively you should order the "Apple LaserWriter Pro 810 TCP/IP - LAT Protocol and Command Reference."

PrintMonitor: Manual Feed Notification (4/94)

Revised: 4/21/94
Security: Everyone

PrintMonitor: Manual Feed Notification (4/94)

==========

Article Created: 21 April 1994

TOPIC -----

I have two computers that print to the same LaserWriter Pro 630 using different applications. On one system, whenever I select manual feed I get a box that says to insert paper in the manual tray and then go to Print Monitor and tell it to print. It prints fine but this is an annoyance. On my other system I don't get this dialog box.

I am using LaserWriter driver version 8.1.1.

DISCUSSION -----

It's very likely that your PrintMonitor Preferences is set differently on the two systems. When the PrintMonitor window is active, select Preferences in the File menu. One of PrintMonitor's preferences is the ability to set:

"When a Manual feed job starts:"
Give no notification
Display icon in menu bar
Also display alert

The system giving you the additional dialog most likely has the third option selected, whereas the one not giving you the error most likely has the first option selected.

Apple Media Kit Version 1.1: Description (10/94)

Revised: 10/11/94
Security: Everyone

Apple Media Kit Version 1.1: Description (10/94)

==========

Article Created: 20 April 1994
Article Reviewed/Updated: 11 October 1994

TOPIC ----------

Version 1.1 of the Apple Media Kit, Apple Computer's cross-platform multimedia authoring tool, includes enhanced features for both the Apple Media Tool and the Apple Media Tool Programming Environment. The Media tool lets users assemble interactive multimedia presentations that can run on Macintosh and Windows computers without using a programming language. The tool uses object-based authoring for rapid creation of presentation prototypes using rough-draft media elements such as text, pictures, sounds and QuickTime movies.In addition, version 1.1 ships with a demo CD.

DISCUSSION ----------

New Apple Media Tool Features
==========

To give designers and producers more power and flexibility in the project development process, the Tool includes these new features:

- Scrollable PICT and text files, which let designers scroll a picture or text image.
- A selection of cursors, controllers, and scrollbars, which lets designers personalize their projects with a variety of styles.
- QuickTime controller support, which lets designers assign QuickTime movie controllers to movies.
- Improved support for editable text, which lets the designer choose text font, style and color.
- A dissolve effect, which lets users fade from one screen image to another.
- A cross-platform utility that checks movie, picture, sound, and text files for compatibility with the Microsoft Windows platform and converts, if necessary, the files to the cross-platform formats of the Apple Media Kit.

- An addendum, which explains the new features and answers the most commonly asked questions about project creation using the Tool.

Enhanced Apple Media Tool Programming Environment

The number of classes in the Programming Environment (PE) has doubled in size from version 1.0, so programmers have a richer development environment in which to work. These classes have also been enhanced to support the new Tool features previously described.

The PE now includes sample source code that programmers can incorporate into their own projects or use as a reference. Programmers may customize cursors, scrollbars and controllers using common resource editing tools such as ResEdit.

The new version of the PE also has improved documentation and support. The revised PE documentation, which ships with version 1.1, is more comprehensive, providing detailed descriptions of new and existing features. It also includes an index that allows programmers to quickly locate a reference.

Demo CD

The demo CD that ships with the new software is included as a reference tool for designers and programmers and includes, among other things, a number of sample projects with source code. It lets users view projects and understand how to better utilize the Apple Media Tool and Programming Environment. The Demo CD includes the following components:

- A demo version of the Apple Media Tool, which lets designers create, edit and preview interactive multimedia projects. The only feature that is not enabled in this demo version of the Tool is the ability to create a runtime for the project;

- Four sample Apple Media Tool projects. Among the projects is a complete copy of "Peter's Magic Adventure", a children's edutainment title published under Apple's StarCore label, valued at $29.95. Designers can open up the projects to see how they were created;

- A sample Programming Environment (PE) animation project entitled "Gearhead", which was created by Art Technology Group in Cambridge, MA. This sample project illustrates how the PE can be used to create extensions to Apple Media Kit projects. The PE includes a number of sophisticated animations and special effects. Source code for the project is also included enabling programmers to better understand how to use the object-oriented development environment to enhance projects;

- Additional Programming Environment sample code, which provides examples of possible extensions that may be incorporated into projects. These possibilities include flipbook animations; Hypertext links, which enable the user to click and browse through information; and the use of Plaintalk, Apple's text-to-speech technology;

- A complete electronic version of the Programming Environment

documentation;

- A list of Programming Environment consultants who can provide project support, with background on their specific areas of specialty.

Ordering and Support Information

Pricing

The Apple Media Tool is available for US $795, the Apple Media Tool Programming Environment is US$995 and the Apple Media Kit, which includes both the Tool and the Programming Environment, is US$1,495. The demo CD, which ships with version 1.1 of the Kit, is also available separately for US $10.

Upgrades

Version 1.1 of the Apple Media Tool will be sent free to all registered users of version 1.0. Customers who do not receive their upgrade will be referred to APDA.

Usage Requirements

- Macintosh IIci or later with at least 8MB DRAM
- System 7.1
- AppleCD CD-ROM or comparable CD-ROM drive

Support

Up and Running support for the Apple Media Tool is provided by the Software Support group at Apple Assurance.

LaserWriter Pro 810: VMS Missing PRO810V1.SYS File (4/94)

Revised: 7/7/94
Security: Everyone

LaserWriter Pro 810: VMS Missing PRO810V1.SYS File (4/94)

==========

Article Created: 20 April 1994

TOPIC ----------

We are having problems setting up the connection between VMS and our LaserWriter Pro 810. We have VMS 5.5, and LaserWriter Pro 810 on 10Base-T which we're trying to connect, but we can't configure the Ethernet port.

We copied the disk image over to the VAX. Went through installation, and noticed that something was missing, the "PRO810V1.SYS" file. We checked the Saveset, and it wasn't there, either.

We ran APLCONFIG and also had a problem, the Ethernet address specified was incorrect (specifies 00-0C-25 as Ethernet address instead of 00-C0-25...), so we entered the correct address by running dsv config. We then went into NCP and connected to the printer by doing "Connect Via" using the printers Ethernet address; we connected to the server port on the printer, which we could configure, and did a LAT command test. We could see that data get to the printer, but it didn't print.

We weren't able to connect the node by using node name from NCT. We could only connect using physical address.

We then went into LAT CP and created a port, then tried a copy data to that port, but it didn't do anything, it just hung. We set host /dte to that port and a session hung.

What are we doing wrong?

DISCUSSION ----------

The PRO810V1.SYS file is not necessary with a LaserWriter Pro 810. PRO810V1.SYS is a file that is loaded remotely from the VAX to boot the printer. This file instead, is in the ROM of the printer and is auto-loaded when the printer is started.

You ran APLCONFIG and the Ethernet address was inverted. You found a valid bug, but since the PRO810V1.SYS file is not required, APLCONFIG is also not required.

Since the documentation does not specifically tell a user what to do if the PRO810V1.SYS file is not present, I have enclosed a log file that explains the install step by step.

•••• Step #1 - reinstall the LaserWriter Pro 810 software using the VMSINSTAL as instructed in the printers manual.

•••• Step #2 - re-set the printer back to factory specs.

;         Apple Computer LaserWriter PRO 810 Printer
;                    Make Print Queue  Utility
;                        Rev 1.0
;*****************************************************************
;       APPLE_QUE.COM           09/15/93
;       CREATE AND START A PRINT QUE ON Apple Computer PRO810 Printers
;       P1      PRINTER OR PRINT SERVER TYPE
;       P2      ETHERNET ADDRESS
;       P3      QUE NAME
;       P4      LTA NUMBER
;       P5      VIRTUAL PRINTER NAME
;       P6      FORM NAME
;*****************************************************************
press any key to continue :

        In order to create a LAT port, the exact name of the printer
        server is needed. PRO810 by default uses the name APL followed
        by its last 6 digit's of Ethernet address. this data found on
        the printer's status page. It is necessary to have this address
        to continue. Eaxmple  00C530

Last 6 digits of Server Ethernet Address : 010488

        Select a VMS queue name to be used for this printer. It is
        recommened to select a simple descriptive name that describes
        the printer type and possible location.

        Examples: post330_eng text_ls_room2 post800_vp_sales

        using this method should make tracking printers, queues and
        printer names cleaner

VMS queue name : test_ascii

        Select an LTA port number to be used for this printer.
        It is recommended to check the numbers already used to
        avoind duplicates. Example  101

LTA number : 927

        Please provide the type of Virtual Printer Service
        this  queue is being made for
        Valid Services are:
                        1. POSTS300 PostScript 300 dpi
                        2. POSTS400 PostScript 400 dpi
                        3. POSTS600 PostScript 600 dpi
                        4. POSTS800 PostScript 800 dpi
                        5. ASCII_PORTRAIT ASCII text printer Portrait mode
                        6. ASCII_LANDSCAPE ""    ""    ""    Landscape ""
                        7. GENERIC
```

```
Virtual Printer Service type ?: 5

        Select a Printer Form, the factory provided form is PS this
        form defines the paper size as 8.5 X 11

enter Form Name : ps
NOTE 1:
        The print queues expect to have a valid form operational on the
        system. The Factory default generic form is PS, which is started
        by issuing the command @PSFORM.

        It is necessary to insert the following line in your system
        startup command procedure SYS$MANAGER:SYSTARTUP_V5.COM to
        create and start the queue every time the system boots.

        $ @MOM$LOAD:[DECSERVER] PSFORM.COM
        $ @MOM$LOAD:[DECSERVER]TEST_ASCII.COM

NOTE 2:
        TEST_ASCII has been defined as PRINT/QUE=TEST_ASCII
press any key to continue:
NOTE 3:
        If you wish this symbol to be defined for all users, insert the
        following line in system wide login file SYS$MANAGER:SYLOGIN.COM

        $ TEST_ASCII    :== PRINT/QUEUE = TEST_ASCII

••••There is a bug in the command procedure, where the user must enter "y" to
the next two questions.

Do you want to see the file (Y,N) [Y] :
Do you want to start the queue now (Y,N) [Y] :

CPU Energy Saver & Geoport: Wake up Possible? (4/94)

Revised: 4/20/94
Security: Everyone

CPU Energy Saver & Geoport: Wake up Possible? (4/94)

==========

Article Created: 20 Apr 1994

TOPIC -----

I have a Power Macintosh 8100/80AV running the CPU Energy Saver Cdev with a GeoPort™ Telecom Adapter connected. Can I set my Power Macintosh to wake up from CPU Energy Saver when a phone call comes through on my GeoPort™ Telecom Adapter?

DISCUSSION -----

The answer is NO. Here's why:

The Power Macintosh needs to be ON to be able to answer the phone using a GeoPort™ Telecom Adapter and Express Modem Software. The CPU Engergy Saver software shuts down your system at a time you specify. With your Macintosh shut down your GeoPort™ Telecom Adapter cannot be utilized.

The CPU Engergy Saver software does have a feature called "Do not shut down if a serial port is being used". If either port is active (i.e. Geoport waiting for a phone call), the system will not shut down. You can disable this feature by unchecking this option.

LaserWriter Pro 810: Postscript using lpr from Unix (4/94)

Revised: 4/20/94
Security: Everyone

LaserWriter Pro 810: Postscript using lpr from Unix (4/94)

==========

Article Created: 20 April 1994

TOPIC ----------

This article describes how to print Postscript files to the LaserWriter Pro 810 using lpr in Unix.

DISCUSSION ----------

The Postscript port on the LaserWriter Pro 810 is defined as port 3107. You can find the port definition of the other ports by taking the printer off line and telling it to print a status page.

The following is the printcap file from a Sun computer. The Printer is called 'reams' and it is the 8th printer defined in the printcap. Replace 'reams' with the name of your printer in the appropriate place if you want to print Postscript from Unix to the LaserWriter Pro 810.

```
# ** |reams8| entry maintained by Apple Printer Installation Program **
# printer type =PRO810
# printer interface type =Ethernet
# printer physical port number =1
reams8|reams8|Apple remote printer on port 1:\
        :lp=/dev/reams8:\
        :sd=/usr/spool/reams8:\
        :of=/home/software/apple/bin/apprint:\
        :mx#0:\
        :sf:\
        :sh:\
        :pw#0:\
        :apple_n=17.127.4.47:\
        :apple_pcs=:\
        :apple_scs=:\
        :apple_text=disable:\
        :apple_p=3107:
```

It is important to note the apple_text=disable and the apple_p=3107. Now any job printed to the Reams8 print queue will be printed as a Postscript job.

In order to print a Postscript file once this printcap is in place you should type lpr -P reams8 <filename>.

PowerTalk: Version 1.0.2 vs 1.0.3 on Power Macintosh (4/94)

Revised: 4/20/94
Security: Everyone

PowerTalk: Version 1.0.2 vs 1.0.3 on Power Macintosh (4/94)

==========

Article Created: 20 April 1994

TOPIC -----

Why is PowerTalk For Power Macintosh version 1.0.2 being made available? Wasn't PowerTalk For Power Macintosh version 1.0.3 already available?

DISCUSSION -----

Apple is recommending that customers use version 1.0.2 PowerTalk Install Me First disk when installing PowerTalk on Power Macintosh and Power Macintosh Upgrade Card systems.

A problem was discovered with the installer script on the PowerTalk For Power Macintosh version 1.0.3 Install Me First disk. The problem was that it would not install properly on systems with Power Macintosh Upgrade Cards. This problem does not exist on the PowerTalk For Power Macintosh version 1.0.2 Install Me First disk. Except for the installer script, the software contained within the 1.0.2 & 1.0.3 Install Me First disks is identical.

Newton MessagePad: Newton Data Viewer Not Available (12/94)

==========

Article Created: 19 April 1994
Article Reviewed/Updated: 8 December 1994

TOPIC ----------

Bundled with my Connection Kit 2.0 software is a card I can send in for some free software. What is this software, and what does it do?

DISCUSSION ----------

The card can be sent to Apple in order to receive the Newton Data Viewer software from StarCore. The card states that it takes 4-8 weeks for delivery of the software.

What is the Newton Data Viewer?

Mobile Information Management is as close as your Newton with Newton Data Viewer, an exciting new software title, available from StarCore.

With the Newton Data Viewer software, you can now take any text, spreadsheet or list file from your desktop computer to your next meeting with the Newton MessagePad. All you need to do is download the data to your Newton MessagePad. Once the information is on your Newton MessagePad, you can review and update any of the files. With the Newton Data Viewer, all your information is at your fingertips.

Availability

The Newton Data Viewer software is not currently available.

StyleWriter II: Removing White Lines In Text (4/94)

Revised: 4/21/94
Security: Everyone

StyleWriter II: Removing White Lines In Text (4/94)

==========

Article Created: 21 April 1994

TOPIC --

I keep getting horizontal white lines through my text. I have purged the cartridge several times and even replacing the ink cartridge, but this has not fixed the problem. How can I get rid of the white lines?

DISCUSSION --

The horizontal white lines are caused by an accumulation of lint on the left side of the wiper. If the wiper is cleaned so the lint is removed, the problem disappears. The lint absorbs the ink and causes the white lines. The printing nozzles should not come in contact with anything during printing. But when lint is present, it attaches to the nozzles damaging the nozzle. This damage can be temporary or permanent. This is why changing the ink cartridge doesn't fix the problem.

Preventing White Lines

Environmental conditions are the primary cause of the lint build-up. If paper is left in the paper tray for a period of time, then the top sheet should be removed prior to printing. The nozzle should also be checked periodically and any lint build-up removed.

Fax Viewer: Reversed Text Caused By Number of Colors (1/97)

==========

Article Created: 21 April 1994
Article Reviewed/Updated: 20 January 1997

TOPIC ----------

This article describes a problem with the Fax Viewer application that shipped with early GeoPort Telecom Adaptor and Express Modem software kits.

DISCUSSION ----------

If colors in the Monitors control panel are greater than 256, received Fax documents display and print white letters on a black background, rather than black on white. Changing the colors to 256 or less fixes the problem. Sent Faxes are not affected by the number of colors and are sent properly with any amount of colors displayed.

This problem was corrected for PowerBook computers as early as Express Modem software version 1.5.2.

This issue has been resolved on all Macintosh computers and PowerBooks that use either a GeoPort or Express Modem with Apple Telecom 2.1 or higher software. You should upgrade your Fax software by installing Apple Telecom 2.x. Apple Telecom 2.1 is available on many on-line services. The Apple Telecom 2.x software package is available on the following online locations:

- On the Internet at the following sites:
  - Worldwide Web: <http://www.info.apple.com/swupdates>
  - ftp: <ftp://ftp.info.apple.com/>
- On America Online, use keyword: applecomputer

- On CompuServe, use GO: APLSUP

These articles can also help you locate software mentioned here:

ImageWriter II: Needs Updated Version of SimpleText (10/94)

==========

Article Created: 19 April 1994
Article Reviewed/Updated: 13 October 1994

TOPIC ----------

When I try printing a multiple page document from SimpleText 1.0 to my ImageWriter II, it prints about a quarter of the first page and then stops. I can print this document from other application programs, but not from SimpleText. Why?

DISCUSSION ----------

SimpleText 1.0 seems to be incompatible with the ImageWriter II. In order to print from SimpleText, use Version 1.1.1. SimpleText 1.1.1 ships with System 7.5 and is also available on online services where Apple posts software updates.

These articles can help you locate software updates mentioned here:

LW Pro 810 Won't Print Two Chinese TrueType Fonts per Page 4/94

Revised: 4/22/94
Security: Everyone

LW Pro 810 Won't Print Two Chinese TrueType Fonts per Page 4/94

==========

Article Created: 21 April 1994

TOPIC ----------

When printing a single page PageMaker 3.5 (Chinese version) document an A3 size paper consisting of more than one Chinese TrueType font, the LaserWriter Pro 810 produces a page with one of the fonts printed correctly, while the other is unintelligible. If the same document is converted to contain only one TrueType Chinese font, the result was fine.

We have tried all of the print options in both PageMaker and the LaserWriter Pro 810, that is printing with effects not checked, different resolutions, and so on, but with no avail. Is there anything we can try?

The printer's configuration is as follows:

Interpreter version	2011.113
Revision	1
Installed Memory	16 MB
VM Maximum	1,335 KB
VM Available	1,300 KB
Resolution	400 DPI

I was told the value of VM affects the size of the font cache, is that true? If it is, can it be changed to resolve this problem?

DISCUSSION ----------

This problem can most likely be attributed to not enough RAM in the printer. Even though there is 16MB of RAM in the printer, the majority of it, about 14MB, is set aside for a page buffer. To explain more specifically, when the printer is powered ON it checks for the total amount of RAM and then allocates a page buffer to accommodate the largest page size available at the highest DPI. Thus, for the LaserWriter Pro 810, the page buffer allocated would be for a tabloid size page at 800dpi.

Increasing the RAM should resolve this issue as there is probably not enough memory to handle all of the outlines. One thing you might try to help alleviate the problem is to enable Unlimited Downloadable fonts in the Options dialog of Page Setup. This will purge a font automatically once it is used which will free up RAM, however a print job may take longer.

With regard to the font cache, it's size varies with the amount of VM available but again comes back to the amount of total RAM in the printer.

Multiple Scan 20 Display: Older Video Cards Incompatible (4/94)

==========

Article Created: 25 April 1994

TOPIC ----------

I have a Macintosh IIfx with an 8-bit video card and a video card for a 21-in Apple Monitor. Can I use either of these cards with the new Apple Multiple Scan 20 Display?

DISCUSSION ----------

Apple Computer makes every practical attempt to allow older products, such as the video cards you have mentioned, to function with new state of the art products like the Apple Multiple Scan 20 Display. However, is this particular case it was not possible to incorporate the old video card technology to perform with the new display. So, neither of these cards will operate with the multiple scan display.

LaserWriter Pro 810: Getting The Ethernet Address (4/94)

Revised: 4/22/94
Security: Everyone

LaserWriter Pro 810: Getting The Ethernet Address (4/94)

==========

Article Created: 21 April 1994

TOPIC -----

Is there a utility to query the Ethernet address of a LaserWriter Pro 810? This would prevent me from dismantling the printer to look at the label on the Ethernet card.

DISCUSSION -----

There are a couple of ways to get the Ethernet address of the LaserWriter Pro 810 without having to look at the card. They are as follows:

- Print the "Printer Configuration" page which has the Ethernet address under the 10-base-2 values, here's how:

  1) Hit "Online" in the printer's control panel, this will take it offline.

  2) Press "Print Status" which will print out a couple of pages, one of which is the Printer Configuration page.

- The other way to get the Ethernet address is to download the following PostScript code to the printer:

```
/Times-Roman findfont
15 scalefont
setfont
72 700 moveto
/str 20 string def
(Ethernet Address:  ) show
(%EtherTalk%) currentdevparams /EthernetAddress get str cvs show
showpage
```

Power Macintosh: S-Video In and Out (4/94)

Revised: 3/23/95
Security: Everyone

Power Macintosh: S-Video In and Out (4/94)

==========

Article Created: 20 April 1994

TOPIC ----------

I am trying to digitize video on a NTSC monitor, and am having some problems. Here is my configuration:
- Power Mac 6100/60 AV
- 14" monitor on HDI-45 (no adapter for DB-15 on AV card)
- video camera connected to S-video-in
- 9" NTSC monitor on S-video-out

I cannot do anything more than "Identify" the 9" monitor (shows "2" on the screen) unless S-video-in for camera is unplugged. Then NTSC monitor seems to work fine.

DISCUSSION ----------

You should be able to use and digitize video on a NTSC monitor. This configuration has tested and worked fine.

Here are some thing you should check or try:
1. Check to see that the AV card's monitor is not set to millions of colors -- the video digitizer only works up to thousands of colors.
2. Disable third-party extensions. If this fixes the situation, the conflict may be with a specific extension.
3. Try a clean install of the System Software.

Apple Shared Library Manager: Errors And Resolution (3/95)

Revised: 3/15/95
Security: Everyone

Apple Shared Library Manager: Errors And Resolution (3/95)

==========

Article Created: 22 April 1994
Article Reviewed/Updated: 15 March 1995

TOPIC -----

Earlier revisions of the Apple Shared Library Manager may cause problems with the AV enabler or with the GeoPort on AV or Power Macintosh computers.

DISCUSSION -----

The Shared Library Manager extension and System Enabler 088 v1.0 are not compatible and may cause bus errors at startup. Both the QuickTake and GeoPort software install the Shared Library Manager extension. The Shared Library Manager makes the Macintosh operating system more efficient for developers.

System Enabler 088 v1.1 is compatible with the Shared Library Manager and fixes the bus error that may occur with version 1.0 of the System Enabler. An upgrade to the Shared Library Manager, to 1.1.2 or later, will resolve the problems also.

Article Change History:
15 Mar 1995 - Corrected name of product in title.
08 Jul 1994 - Added info on the 1.1.2 version of the ASLM to resolve problems, retitled to more accurately reflect the contents of the article.

Revised: 4/22/94
Security: Everyone

Power Macintosh AV: No color on NTSC Monitor (4/94)

==========

Article Created: 22 April 1994

TOPIC ----------

I have a TV or Composite/NTSC monitor connected to my Power Macintosh AV system, and I can only get grayscale or B&W, even though it is capable of displaying color. What's wrong?

DISCUSSION ----------

First double-check that color is selected in the monitors control panel. Next, double-check that the correct S-Video adapter cable is being used to connect the RCA cable from the TV/monitor to the AV card. If the S-Video-IN cable is used by mistake, you will only get grayscale/B&W on the screen. Replace with the correct S-Video-OUT cable, and you should get a color display on your TV/monitor.

Generic Icons: Applications on Removable Media (4/94)

Revised: 4/22/94
Security: Everyone

Generic Icons: Applications on Removable Media (4/94)

==========

Article Created: 22 April 1994

TOPIC ----------

I have documents on a boot volume and their applications on another volume. Sometimes my documents have generic icons and some times they are normal. Why?

DISCUSSION----------

The Finder uses a file called the Desktop Database on each volume to keep track of icons and other important file information. The Desktop Database on a given volume is only updated when a file with a "bundle resource" is copied to that volume. Bundle resources are found in applications, control panels, extensions or files with custom icons. An Adobe postscript font is an example of a file with a bundle resource (also called bundle bit) that isn't an application, control panel or extension.

Documents and other files associated with a specific application (help files, dictionaries, etc.) do not have this bundle resource and depend on the application to provide this information to the Desktop Database and in turn the Finder.

We don’t have all files use their own bundle resource because it's more efficient in regards to space and copying time to limit the files with bundle resources.

If you have a folder with 100 files with the same custom icon, each will have an entry in the Desktop Database. This is very inefficient. Adobe postscript font files do this for example. Even though they all use the same icon, each one updates the desktop database when copied and has its own unique entry in the desktop database. The desktop database views them
all separately and has 100 entries. By referencing the application, we can have one entry to these same 100 files or 10,000 files, which is much more efficient.

There are some caveats when working with multiple volumes and/or servers. If an application is on a volume that is not available at startup (CD, Syquest, File Server), then document icons on the volumes will appear as generic document icons. If you mount a volume with the application after booting the CPU, the document icons may or may not be generic depending on the sequence of events initiated by the user. Here are some examples:

- If you attempt to ‘view’ a document icon on a start up drive that does not contain the application first, and get the generic icon (have it's window left open or intentionally open it's window), all files of the same ‘type’ will be generic on any volume until you restart.
- If you do not ‘view’ the document icon, mount the volume with the application, and then attempt to view the document on the boot volume, their icons will appear normal.
- You can get an inconsistency if you ‘view’ the document icon but not another file associated with the application (like a dictionary). In this case all occurrences of the document icon will be generic, but the dictionary icons will be normal because they are different file types with different icons.
- Additionally, you can change views to small icon and you will see the correct small icon for the document while the normal size icon is generic.

This starts over again when you restart the CPU.

Suggested work arounds:

1) Have the volume with the application mount on the desktop when the CPU is turned on or restarted.
2) Do not “view” the document icons until the volume with the application is mounted.
3) Copy the application to the volume with the documents. This updates the desktop database, then you can delete the application. The proper document icons will be displayed for that application until the desktop file is rebuilt. If the desktop is rebuilt, the above situation returns since the application with its bundle resource is not there to add the information to the desktop database.

For additional details on bundle resources and the desktop database, refer to the Inside Macintosh series of books and page 118 of "Technical Introduction to the Macintosh Family" second edition. See also the article “Generic (Document or Application) Icons: Restoring Proper Icons.”

AudioVision Monitor: Power on Before Power Macintosh (3/95)

==========

Article Created: 27 April 1994
Article Reviewed/Updated: 17 March 1995

TOPIC -----

The AudioVision extension does not appear on restart along bottom of the screen unless I turn on the AudioVision monitor after the Power Macintosh. The AudioVision Sound slider switch is also missing from the Volumes section of the Sound control panel.

DISCUSSION -----

This is a known feature. It is described in the "Additional Tips and Troubleshooting" manual (page 5) for the PowerPC.

Apple Displays: Changes In Colors Requires Degaussing (4/94)

==========

Article Created: 25 April 1994

TOPIC ----------

What can cause the below symptoms?

When the computer and monitor are powered on, a green an area on bottom left of the monitor changes colors depending on what is displayed on screen. Another less intense area is directly in the center of the screen. Both distortions are approximately one inch high and 3.5 to 4 inches wide.

The display has been moved in the house and checked for any environmental factors but this didn't change anything. The monitor was left off for over 24 hours but the discolored areas didn't change.

DISCUSSION ----------

This sounds like a classic case of magnetic field interference. Evidently the CRT has come in contact with a strong magnetic field that magnetized the CRT screen and thus created the problem you are now having. The magnetic field could have been generated by anything from a small magnet to the electric motor on a vacuum cleaner. The cure is fairly simple. The unit should be degaussed with an external manual degaussing coil, as used by TV technicians. They can be purchased at most good electronic parts stores and cost about $30.00.

Workgroup Server 6150/60: Description (5/95)

Revised: 5/15/95
Security: Everyone

Workgroup Server 6150/60: Description (5/95)

==========

Article Created: 25 April 1994
Article Reviewed/Updated: 15 May 1995

TOPIC ----------

This article provides a description, and features for the Apple Workgroup Server 6150/60.

DISCUSSION ----------

The Workgroup Server 6150 is the most affordable member of the PowerPC processor–based Workgroup Server family from Apple. It delivers the file and print or applications server performance that small workgroups in business and education demand.

Delivering all the benefits of PowerPC performance—while maintaining Macintosh ease of use—the Workgroup Server 6150 features a 60-megahertz PowerPC 601 processor, on-chip and level-2 cache, a large-capacity hard disk drive, and responsive service and support.

The Workgroup Server 6150 also supports third-party electronic mail, calendar, information-retrieval, and database server applications.

But what's really important to the people who set up, maintain, and use this server is that it's very simple to operate. And the software packages that run on it—AppleShare, AppleSearch, Apple Remote Access, PowerShare collaboration server, and a variety of third-party server applications—are all built on the assumption that you shouldn't have to be a computer engineer to run a server.

So if you're considering a server for your workgroup, or an additional server for your network, look closely at the Workgroup Server 6150. It has all the server features most small workgroups need, at a price most can afford.

Workgroup Server 6150 Features

Expansion and storage

- Slot for processor-direct card or NuBus expansion card
- Internal 500MB hard drive
- Internal double-speed CD-ROM drive
- Apple RAID Software
- SCSI bus to support up to seven devices (two internal, five external)
- Eight ports to support a wide range of peripherals

Networking
- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk networking protocols
- Token Ring support optional (with expansion card)

Power, speed, and memory
- 60-MHz PowerPC 601 RISC microprocessor with floating-point processor and 32K on-chip cache
- 256K level-2 cache
- 8MB of RAM, expandable to 72MB

Features Built Into Every Workgroup Server

Fast, easy setup
- Comes with System 7 software installed
- Includes AppleShare 4.0.2 file and print server software

Compatibility
- Runs Apple server software and third-party server applications
- Supports Macintosh and Power Macintosh desktop clients, as well as clients running Windows and MS-DOS, depending on server software*
- Reads Macintosh, Windows, MS-DOS and OS/2 floppy disk formats

Service and support**
- Includes 24-hour telephone support
- Includes within-two-business-day, on-site service response
- Offers optional within-four-hour or next-business-day on-site service response

* Additional third-party server software may be required and must be purchased separately.

** These services are available only in the United States.

Workgroup Server 6150/60: Specifications (5/95)

==========

Article Created: 25 April 1994
Article Reviewed/Updated: 15 May 1995

TOPIC ----------

This article provides specifications and order information for the Apple Workgroup Server 6150/60.

DISCUSSION ----------

Technical Specifications

Microprocessor
- PowerPC 601 RISC microprocessor running at 60 MHz
- Integrated floating-point unit and 32K on-chip cache
- 256K level-2 cache

Memory
- 8MB of RAM
- Can be expanded to up to 72MB of RAM

Drives
- One 500MB internal hard disk
- One AppleCD 300i Plus CD-ROM drive (up to 342K-per-second streaming data-transfer rate)
- One Apple SuperDrive 1.4MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS and OS/2 disks

Networking
- Built-in Ethernet
- Two serial ports for LocalTalk

Displays
- Supports up to 14-inch Apple displays at 32,768 colors, and 16- and 17-inch Apple displays at 256 colors

- Supports most third-party displays as well as VGA and SVGA monitors

Video support
- Built-in DRAM display support

Interfaces
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other device
- AAUI-15 Ethernet connector
- High-density display port supports Apple AudioVision monitors directly and supports other displays via a Power Macintosh Display Adapter
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- High-speed asynchronous SCSI interface connects up to seven SCSI devices
- 16-bit stereo sound input and output ports
- Internal expansion slot for processor-direct or 7-inch NuBus expansion card (both require adapter that must be purchased separately)

Clock/calendar
- Custom integrated circuit with long-life lithium battery

Disability access
- Easy Access and visible beep included with system software to provide alternative input and output devices for people with disabilities

Electrical requirements
- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 210 W maximum, not including display

ADB power requirements
- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Keyboard and mouse
- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Size and weight
- Height: 3.4 in. (8.5 cm)
- Width: 16.3 in. (41.5 cm)
- Depth: 15.6 in. (399.7 cm)
- Weight: 14.0 lbs. (6.4 kg) (varies based on internal devices installed)

Operating environment
- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Storage temperature: –40 to 116.6 degrees F (–40 to 116.6 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Regulatory approval
- FCC Class B

Ordering Information

Workgroup Server 6150
Order No. M3358LL/A

- Workgroup Server 6150 computer with 8MB of RAM, 256K level-2 cache, 500MB hard disk drive, internal CD-ROM drive, and 1.4MB Apple SuperDrive floppy disk drive
- Mouse
- System 7 software
- AppleShare 4.0.2 software
- Power Macintosh Display Adapter
- Complete setup, learning, and reference documentation
- Limited one-year warranty

Workgroup Server 6150 Logic Board Upgrade
Order No. M2913LL/A

- Upgrades a Workgroup Server 60 to a Workgroup Server 6150 (must be installed by an Apple authorized service provider); includes 8MB of RAM, 256K level-2 cache, as well as AppleShare 4.0.2

Macintosh Memory Expansion Kits
Order No. M1507LL/A

- 4MB (1–4MB SIMM)

Order No. M1508LL/A

- 8MB (1–8MB SIMM)

Order No. M3372LL/A

- 16MB (1–16MB SIMM)

Order No. M3373LL/A

- 32MB (1–32MB SIMM)

Note: SIMMs must be installed in pairs by an authorized Apple service provider. The Work-group Server 6150 comes with 8MB of RAM on the logic board and two available SIMM sockets.

Power Macintosh 6100/60 NuBus Adapter Card
Order No. M2337LL/A

- Allows you to add support for one 7-inch NuBus card to Workgroup Server 6150

Apple Token Ring NB/c Card
Order No. M1769Z/A

Workgroup Server 8150/80: Description (5/95)

==========

Article Created: 25 April 1994
Article Reviewed/Updated: 15 May 1995

TOPIC ----------

This article provides a description, and features for the Apple Workgroup Server 8150/80.

DISCUSSION ----------

The Workgroup Server 8150 is the midrange member of the PowerPC processor–based Workgroup Server family from Apple. It's designed to meet the varied price, performance, and expansion needs of medium-sized workgroups in education, business, and publishing.

Delivering all the benefits of PowerPC performance—while maintaining Macintosh ease of use—the Workgroup Server 8150 features an 80-megahertz PowerPC 601 processor, on-chip and level-2 cache, a large-capacity hard disk drive, Retrospect Remote automatic client and server backup software, and responsive service and support.

Not only is the Workgroup Server 8150 easy to set up, it's also designed to work with easy-to-use Apple server software programs such as AppleShare, AppleSearch, Apple Remote Access, and PowerShare collaboration server, as well as third-party server software. And it's perfect for publishing, database, accounting, electronic-mail, calendar, and remote-access server applications.

If you're looking for a server that can accommodate today's budget and expand to handle tomorrow's demands, the Workgroup Server 8150 is likely to bring your search to a very positive conclusion.

Workgroup Server 8150 Features

Expansion and storage
• Three NuBus slots for expansion cards
• One processor-direct slot

- Internal 1GB hard disk drive
- Internal DDS-2 Digital Audio Tape (DAT) drive
- Internal double-speed CD-ROM drive
- Retrospect Remote automatic server and client backup software
- Apple RAID software
- Support for up to eight SCSI devices (three internal, five external)
- Nine ports to support a wide range of peripherals

Networking
- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk networking protocols
- Token Ring support optional (with expansion card)

Power, speed, and memory
- 80-MHz PowerPC 601 RISC microprocessor with floating-point processor and 32K on-chip cache
- 256K level-2 cache
- 16MB of RAM, expandable to 264MB

Features Built Into Every Workgroup Server

Fast, easy setup
- Comes with System 7 software installed
- Includes AppleShare 4.0.2 file and print server software (in some configurations)

Compatibility
- Runs Apple server software and third-party server applications
- Supports Macintosh and Power Macintosh desktop clients, as well as clients running Windows and MS-DOS, depending on server software*
- Reads Macintosh, Windows, MS-DOS and OS/2 floppy disk formats

Service and support**
- Includes 24-hour telephone support
- Includes within-two-business-day, on-site service response
- Offers optional within-four-hour or next-business-day on-site service response

* Additional third-party server software may be required and must be purchased separately.

** These services are available only in the United States.

Technical Specifications

Microprocessor
- PowerPC 601 RISC microprocessor running at 80 MHz
- Integrated floating-point unit and 32K on-chip cache
- 256K level-2 cache

Memory
- 16MB of RAM
- Can be expanded to up to 264MB of RAM

Drives
- One 1GB Apple hard disk drive
- One DDS-2 DAT drive (4 GB uncompressed, 10-14 GB compressed)
- One AppleCD 300i Plus CD-ROM drive (up to 342K- per-second streaming data-transfer rate)
- One Apple SuperDrive 1.4MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS and OS/2 disks

Displays
- Supports up to 14-inch Apple displays at 32,768 colors, and 16- and 17-inch Apple displays at 256 colors
- Supports most third-party displays as well as VGA and SVGA monitors

Video support

- Built-in DRAM display support

Interfaces
- Three NuBus expansion slots
- One processor-direct slot
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and one additional ADB device
- AAUI-15 Ethernet connector
- High-density display port supports Apple AudioVision monitors directly and supports other displays via a Power Macintosh Display Adapter (included)
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- Dual-channel, asynchronous SCSI DMA interface; one channel supports up to five external and two internal SCSI devices, the other channel supports an internal hard disk
- 16-bit stereo sound input and output ports

Networking
- Built-in Ethernet
- Two serial ports for LocalTalk

Clock/calendar
- Custom integrated circuit with long-life lithium battery

Disability access
- Easy Access and visible beep included with system software to provide alternative input and output devices for people with disabilities

Electrical requirements
- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 200 W maximum, not including display

ADB power requirements
- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Keyboard and mouse
- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Size and weight
- Height: 14.25 in. (30.6 cm)
- Width: 8.9 in. (19.6 cm)
- Depth: 16.0 in. (39.6 cm)
- Weight: 25.3 lbs. (11.5 kg) (varies based on internal devices installed)

Operating environment
- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Storage temperature: –40 to 116.6 degrees F (–40 to 116.6 degrees C)

- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Regulatory approval
- FCC Class A

Ordering Information

Workgroup Server 8150
Order No. M3300LL/A
  - Workgroup Server 8150 with 16MB of RAM, 256K level-2 cache, 1GB hard disk drive, DDS-2 DAT drive, CD-ROM drive, and 1.4MB Apple SuperDrive floppy disk drive
  - Mouse
  - System 7 software
  - Retrospect Remote software
  - Power Macintosh Display Adapter
  - Complete setup, learning, and reference documentation
  - Limited one-year warranty

Workgroup Server 8150 with AppleShare
Order No. M3359LL/A
  - Identical to above configuration, with the addition of AppleShare 4.0.2 software

Workgroup Server 8150 Logic Board Upgrade
Order No. M2915LL/A
  - Upgrades a Workgroup Server 80 to a Workgroup Server 8150 (must be installed by an Apple authorized service provider); includes AppleShare 4.0.2, and Retrospect Remote software upgrade

Macintosh Memory Expansion Kits
Order No. M1507LL/A
  - 4MB (1-4MB SIMM)

Order No. M1508LL/A

Workgroup Server 9150/80: Description (5/95)

==========

Article Created: 25 April 1994
Article Reviewed/Updated: 15 May 1995

TOPIC ----------

This article provides a description, and features for the Apple Workgroup Server 9150/80.

DISCUSSION ----------

The Workgroup Server 9150 is the most expandable and powerful member of the PowerPC processor–based Workgroup Server family from Apple. It delivers file and print, database and communications capabilities that meet the needs of growing work-groups in education, business, and publishing.

Delivering all the benefits of PowerPC performance while maintaining Macintosh ease of use, the Workgroup Server 9150 features an 80-megahertz PowerPC 601 processor, on-chip and level-2 cache, two large-capacity hard disk drives with space for three more, Retrospect Remote automatic client and server backup software, and responsive service and support.

Not only is the Workgroup Server 9150 easy to set up and administer, it's also designed to work with easy-to-use server software programs such as AppleShare, AppleSearch, Apple Remote Access, and PowerShare collaboration server, as well as third-party server software. And it's perfect for publishing, database, accounting, electronic-mail, calendar, and remote-access applications.

So if you need a server for a large and expanding workgroup that runs sophisticated applications, we have the solution: the powerful and expandable Workgroup Server 9150.

Workgroup Server 9150 Features

Expansion and storage
• Four NuBus slots for expansion cards
• One processor-direct slot (PDS)

- Two internal 1GB or 2GB hard disk drives
- Space for a total of five internal 3.5-inch half-height hard disk drives
- Internal DDS-2 Digital Audio Tape (DAT) drive
- Internal double-speed CD-ROM drive
- Retrospect Remote automatic server and client backup software
- Apple RAID software
- Two SCSI DMA buses to support up to 14 devices (7 internal, 7 external)
- Nine ports to support a wide range of peripherals

Networking
- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk networking protocols
- Token Ring support optional (with expansion card)

Power, speed, and memory
- 80-MHz PowerPC 601 RISC microprocessor with floating-point processor and 32K on-chip cache
- 512K level-2 cache
- 16MB of RAM, expandable to 264MB

Features Built Into Every Workgroup Server

Fast, easy setup
- Comes with System 7 software installed
- Includes AppleShare 4.0.2 file and print server software (in some configurations)

Compatibility
- Runs Apple server software and third-party server applications
- Supports Macintosh and Power Macintosh desktop clients, as well as clients running Windows and MS-DOS, depending on server software*
- Reads Macintosh, Windows, MS-DOS and OS/2 floppy disk formats

Service and support**
- Includes 24-hour telephone support
- Includes within-two-business-day, on-site service response
- Offers optional within-four-hour or next-business-day on-site service response

* Additional third-party server software may be required and must be purchased separately.

** These services are available only in the United States.

Workgroup Server 9150/80: Specifications (5/95)

==========

Article Created: 25 April 1994
Article Reviewed/Updated: 15 May 1995

TOPIC ----------

This article provides specifications and order information for the Apple Workgroup Server 9150/80.

DISCUSSION ----------

Technical Specifications

Microprocessor
- PowerPC 601 RISC microprocessor running at 80 MHz
- Integrated floating-point unit and 32K on-chip cache
- 512K level-2 cache

Memory
- 16MB or 24MB of RAM
- Can be expanded to up to 264MB of RAM

Drives
- Two 1GB or 2GB Apple hard disk drives
- One DDS-2 DAT drive (4MB uncompressed, 10-14GB compressed)
- One AppleCD 300i Plus CD-ROM drive (up to 342K- per-second streaming data-transfer rate)
- One Apple SuperDrive 1.4MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS and OS/2 disks

Displays
- Supports up to 14-inch Apple displays at 32,768 colors, and 16- and 17-inch Apple displays at 256 colors
- Supports most third-party displays as well as VGA and SVGA monitors

Video support

- Built-in DRAM display support

Interfaces
- Four NuBus expansion slots
- One processor-direct slot
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other device
- AAUI-15 Ethernet connector
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- Dual-channel, high-speed asynchronous SCSI DMA interface; one supports up to seven external SCSI devices, the other supports up to seven internal SCSI devices (for a total of 14)
- 16-bit stereo sound input and output ports
- DB-15 video port for display support

Networking
- Built-in Ethernet
- Two serial ports for LocalTalk

Clock/calendar
- Custom integrated circuit with long-life lithium battery

Disability access
- Easy Access and visible beep included with system software to provide alternative input and output devices for people with disabilities

Electrical requirements
- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 303 W maximum, not including display

ADB power requirements
- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Keyboard and mouse
- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Size and weight
- Height: 18.6 in. (47.3 cm)
- Width: 8.9 in. (22.4 cm)
- Depth: 20.6 in. (52.3 cm)
- Weight: 36.8 lbs. (16.7 kg) (varies based on internal devices installed)

Operating environment
- Operating temperature: 50 to 95 degrees F (10 to 35 degrees C)
- Storage temperature: –40 to 116.6 degrees F (–40 to 116.6 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Regulatory approval
• FCC Class A

Ordering Information

Workgroup Server 9150 (16MB/2 x 1GB)
Order No. M3272LL/A
- Workgroup Server 9150 with 16MB of RAM, 512K of level-2 cache, two 1GB hard disk drives, CD-ROM drive, DDS-2 DAT drive, CD-ROM drive, and 1.4MB Apple SuperDrive floppy disk drive
- Mouse
- System 7 software
- Retrospect Remote software
- Complete setup, learning, and reference documentation
- Limited one-year warranty

Workgroup Server 9150 with AppleShare (16MB/2 x 1GB/AppleShare)
Order No. M3357LL/A
- Identical to above configuration, with the addition of AppleShare software version 4.0.2

CD Remote: Changing the Track Order (6/94)

Revised: 6/9/94
Security: Everyone

CD Remote: Changing the Track Order (6/94)

==========

Article Created: 26 April 1994
Article Reviewed/Updated: 9 Jun 1994

TOPIC ----------

I have a Power Macintosh 8100/80AV and I'm using CD Remote to play an audio CD. I can create a customized play list, but I'd like to change the playing order of the the tracks. How do I play track 8 before track 2? I think it's possible, but the manual doesn't explain how.

DISCUSSION ----------

The Power Macintosh uses CD Remote 4.5, which is identical to the CD Remote used on other Macintosh computers.

After you click on the zoom box to reveal the customized Play List, change the playing order of a particular track by holding down the command key and dragging the track before or after another track as it appears in the Play List.

Security: Everyone

Performa 575, 577, 578: Specifications (Discontinued)

==========

Article Created: 25 April 1994
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article provides technical specifications for the Macintosh Performa 575, 577, and 578 computer systems. These products differ in four ways:
• Amount of RAM installed
• Hard drive capacity
• Application software installed
• Where sold

DISCUSSION ----------

Microprocessor

• MC68LC040, 33 MHz clock speed; 32-bit data bus
• Built-in memory-management unit

Memory

• 5MB or 8MB RAM (4MB RAM on logic board)
• Expandable to as much as 36MB by adding 1MB, 2MB, 4MB, 8MB, 16MB, or 32MB SIMM to a single 72-pin slot. Requirement: 72-pin fast-paged, 80ns or faster.
• 1MB ROM

Storage

• One built-in Apple SuperDrive 1.4MB floppy disk drive
• One internal 250MB or 320MB hard disk
• Internal AppleCD 300i Plus CD-ROM drive with new tray-loading design
  - Does not require a CD caddy
  - Average access time: 295 ms
  - Capacity: 650MB
  - Supported formats: Multisession Photo CD, High Sierra (ISO 9660),

Macintosh HFS, Audio CD, CD + G/CD + MIDI,
CD-ROM XA, CD-I
• Start-up (bootable) CD-ROM with system software

Video Display

• Integrated Macintosh Color Display with 14-inch Trinitron CRT
• Resolution: 640 x 480 pixels, 69 dpi, .26 mm dot pitch
• Standard 1MB VRAM supports 32,768 colors (16-bit color)

Interfaces

• Internal expansion slot for one Macintosh LC processor-direct expansion card. Compatible with Apple IIe Card.
• SCSI interface for connecting up to five external devices
• Communication slot can be easily configured -- by the user -- to accept any of three Ethernet cards (10BASE-T, Thin Coax, Apple AUI), or a high-speed 14.4 KB fax/modem (based on PowerBook Express Modem).
• Two serial (RS-232/RS-422) ports
• One stereo sound-output port for external audio amplifier or headphones
• One Apple Desktop Bus (ADB) ports for keyboard, mouse, and other devices
• Front headphone jack
• Built-in microphone above display
• One sound-input port for four sources: internal or external microphone*, internal CD-ROM, or external audio

* - Note: Requries PlainTalk microphone.

Pull-out Logic Board

Allows easy upgrades to DRAM, VRAM, PDS, and communication slot.

Sound Generator

• Stereo 8-bit digital-analog conversion using 22-kHz sample rate, capable of driving stereo headphones or other stereo equipment through the sound jack and headphone jack
• Two built-in stereo speakers
• CD output is 16-bit digital

Keyboard and Mouse

• ADB Mouse II
• Apple Desktop Bus (ADB) keyboard with numeric keypad and two-level tilt adjustment

Clock/Calendar

• Custom integrated circuit with long-life alkaline battery.

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 90 to 264 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 40 W maximum, not including display
  60 W maximum, including display
- Energy-saving feature reduces power consumption by 50%
- One AC outlet powers computer, display, drives, and speakers

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA, depending model used

Software

- Macintosh System Software version 7.1P6, designed specifically for Performa computers. The Performa 575 series requires System Enabler 364.
- At Ease software lets adults share the computer with children -- while protecting valuable data.
- Macintosh PC Exchange lets you work with MS-DOS and Windows disks.
- Application software: a selection of productivity and communication tools already installed on the hard drive.
- Launcher software provides easy way to launch applications, and provides easy access to service and support information, user tips, etc.

Telecommunications

- External Global Village TelePort Bronze modem includes fax send software, (receive software upgrade available from Global Village).

Service and Support

- One year limited warranty
- One year free in-home service
- Toll-free help line
- Support for non-Apple software is provided by the respective software publishers.

Size and Weight

Main unit:

- Height: 17.9 in. (45.5 cm)
- Width: 13.5 in. (34.4 cm)
- Depth: 16.5 in. (42.0 cm)
- Weight: 40.5 lbs (18.4 kg)

Mouse:
• Height: 1.3 in. (3.3 cm)
• Width: 2.4 in. (6.2 cm)
• Depth: 4.2 in. (10.7 cm)
• Weight: 4.0 oz. (0.10 kg)

Operating Environment

• Operating temperature: 50 to 104° F (10 to 40° C)
• Storage temperature: –40 to 116.6° F (–40 to 47° C)
• Relative humidity: 20% to 85% noncondensing
• Maximum altitude: 15,000 ft. (4,722 m)

Article Reviewed/Updated:
19 Aug 1996 - Changed misspelling.
16 May 1995 - Added microphone information.
18 Oct 1994 - Updated modem information.

Workgroup Server 9150: External Cache (4/94)

Revised: 4/26/94
Security: Everyone

Workgroup Server 9150: External Cache (4/94)

==========

Article Created: 26 April 1994

TOPIC ----------

This article describes the external cache of the Workgroup Server 9150 (WS 9150).

DISCUSSION ----------

The optional external cache in the WS 9150 is a direct mapped, write through, 2nd level (L2) cache capable of 2-1-1-1 operation. It is selectable to either unified or instruction only operation, and can be a variety of sizes by the choice of components installed in the cache SIMM. Two pins on the SIMM socket are read by the High speed Memory Controller (HMC) at reset, and are intended to indicate the cache size to the Operating System software so meaningful diagnostics can be performed. If the SIMM is not present, pullup resistors on these pins disable all L2 cache related operations. If the SIMM is installed, the cache can be enabled or disabled from the HMC control register, although updates will still be performed to insure coherency.

Tag Organization

The L2 cache tags all 32 bits of the PowerPC 601 processor's physical address. Address bits A(0:14) comprise the tag, A(15:26) index the set location, and A(27:31) form the line offset as shown in figure 4. In addition to A(0:14) the tag also compares a valid bit. The valid bit is cleared by a system reset and set by a cache line allocate operation.

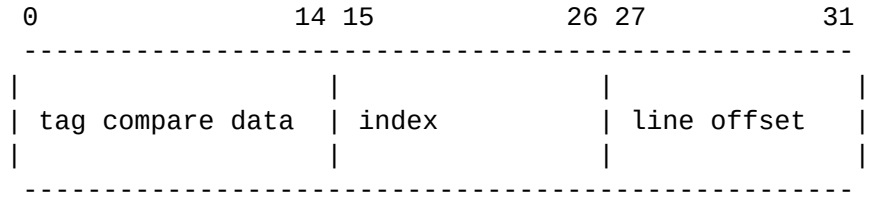

Figure 4: Address Tag Organization

Cache Coherency

The L2 cache maintains a single valid bit for each 32 byte line. The valid bits are cleared by a system reset and individually set when a line is allocated in the cache. When the L2 cache is operating in the unified mode, a cache line is never invalidated other than system reset.

The PowerPC 601 processor broadcasts primary cache manipulation instructions so that other caches in the system can mirror the functionality of the instruction. Since the HMC makes the assumption that the L2 cache is bound to main memory rather than the processor, it ignores these broadcasts. Executing these invalidate memory cycles potentially discards useful data. In order to keep the L2 cache coherent without invalidating, all PowerPC 601 processor's write transactions, force a tag compare. Cache-inhibited write data is tag compared due to the possibility that the data was formerly cache-enabled and allocated.

Configuring the L2 cache as instruction-only alters the line allocation policy but does not affect the write-update procedure. This prevents stale instruction data that could be caused by relocating program code.

Whenever the tag matches on a write cycle, data is updated in the cache simultaneously with the write-buffer being filled. Bus cycles that write less than the full 64 bit data bus width, utilize the cache data RAM synchronous write-enables to select the appropriate byte lanes. To permit writes to execute as quickly as possible, the cache data RAM write-enables are qualified with the state of the tag match. As a result, the first beat of a two-clock write that misses the cache will be aborted asynchronously.

Since all 32 address bits are significant to the cache, but not to the physical memory decode (there are physical aliases of both DRAM and ROM), access of physical memory aliases is not recommended as it can result in stale data in the L2 cache. This feature allows cache testing.

Line Allocation

Cache lines are allocated only on PowerPC 601 processor's burst read memory cycles. Read data is forwarded to the CPU in conjunction with the line fill. The L2 cache is write-through so write transactions are never allocated. Setting the HMC control register bit, L2_INST, forces the L2 to cache only instruction fetches. The PowerPC 601 processor's TC(0) output distinguishes whether the bus read data is instruction or data.

The L2 cache attempts to allocate cache lines similarly to the PowerPC 601 processor primary cache. The PowerPC 601 processor bus transaction modifiers that affect line allocation are cache-inhibit and transfer-burst. Cache-inhibiting an address space prevents the L2 cache from allocating lines in that address space. Thus memory areas such as DMA buffer space that might be marked cache-inhibited will not thrash the L2 cache. The HMC also watches the transfer-burst signal for single-beat transactions. Because the granularity of the L2 cache valid data is 32 bytes, single-beat transactions are not allocated. Additionally, single beat reads are never looked up in the cache even if the cache-inhibit line is de-asserted.

The cacheable address spaces are RAM at $00000000-$3FFFFFFF, Macintosh ROM at $40000000-$4FFFFFFF, and PowerPC ROM at $FF000000-$FFFFFFFF. Other address locations, such as the PDS (processor direct slot), are not cached in the L2, but may be cached in the PowerPC 601 processor's primary cache.

Testing

Since all of the address bits are tagged, aliases of physical RAM space will appear distinct to the cached, but not to uncached data. This allows testing to determine proper cache operation. Normally the L2 cache ignores ROM writes. However, by setting the L2ROMW bit, ROM writes will update the cache. For normal ROMs, the cache will now be inconsistent with memory, allowing ROM caching to be tested.

Workgroup Server 9150: Internal Cache Brief Description (4/94)

Revised: 4/26/94
Security: Everyone

Workgroup Server 9150: Internal Cache Brief Description (4/94)

==========

Article Created: 26 April 1994

TOPIC ----------

This article briefly describes internal cache on the Workgroup Server 9150 (WS 9150).

DISCUSSION ----------

The PowerPC 601 processor maintains a 32 kilobyte, unified, set associative internal cache, organized as 64 sets of 8 lines were each line is divided into 2 sectors of 32 bytes each. The cache supports inhibit, copy back or write-though on a page basis, and both refills and writes back are 4 double word burst transactions.

Workgroup Server 9150: Memory Bus Operations (4/94)

Revised: 4/26/94
Security: Everyone

Workgroup Server 9150: Memory Bus Operations (4/94)

==========

Article Created: 26 April 1994

TOPIC ----------

This article describes the memory bus operations of the Workgroup Server 9150 (WS 9150).

DISCUSSION ----------

The High speed Memory Controller (HMC) contains a single read/write control register and resets to a "least critical" state to guarantee operation on power up. The HMC supports the basic PowerPC 601 processor's transfer protocol, including all of the PowerPC 601 processor's single beat accesses with the addition of the 4 beat 32 byte cache line access. Only the transfer codes in the basic protocol will generate a response from the HMC. Extended protocol codes will result in a transfer error exception from the WS 9150 I/O controller. The WS 9150 does not support the Little Endian mode of the PowerPC 601 processor.

Misalignment

Misaligned reads from the PowerPC 601 processor are translated into standard double-word reads by the HMC. However misaligned writes are fully decoded so only the appropriate DRAM CAS signals are selected. The L2 cache mirrors this functionality through the cache data RAM asynchronous write-enables so that RAM write hits are updated properly.

Address Only Transaction

The PowerPC 601 processor initiates address-only transactions when instructions that affect the level 1 cache are executed. These transactions never require data bus tenure but do require an address acknowledgment. The HMC decodes the TT(1) input to identify the address only cycles and asserts AACK_ on the third clock following transfer start.

Arbitration

Bus arbitration is fielded by the HMC on the address bus only. Granting of the data bus is implicit based on successful arbitration for the address bus. The PowerPC 601 processor's bus protocol specifies an arbitration overhead of one CPU clock unless bus parking is used. Bus parking is a situation that occurs when bus grant is asserted to a bus master who is not currently requesting the bus. Since the PowerPC 601 processor is the primary WS 9150 bus master, the HMC eliminates one clock of the PowerPC 601 processor's memory latency by parking the PowerPC 601 processor on the bus. The HMC arbitration logic is a simple combinational decode of the bus request signals. Priority of bus granting is fixed in the order of DMA, PDS, and lastly the PowerPC 601 processor. The PowerPC 601 processor is only granted the bus in the absence of other bus requests. As a result the PowerPC 601 processor bus request is not an HMC input. Receiving a bus grant from the HMC does not imply that the bus is unused. It is the responsibility of the requesting device to verify that the bus is indeed free by qualifying bus grant with the de-assertion of ABB_. The WS 9150 adds an extra level of decode in order to have both the VRAM frame buffer and the NuBus controller use the same bus request bus grant lines to HMC. The NuBus controller has priority over the VRAM based frame buffer.

Pipelining

All memory bus transactions are non-pipelined.

Snooping

The primary focus of the WS 9150 is uni-processing, and provisions for snooping would lengthen the latency to 2nd level cached data by 50% (from 2 clocks minimum to 3 clocks). For this reason, snooping of other processor internal caches is not supported on the WS 9150 memory bus. Alternate masters can be designed to snoop the PowerPC 601 processor's internal cache, provided certain restrictions are followed. When the alternate master reads data from DRAM that data must not be forwarded or acted upon until the ARTRY_ window has expired. If the PowerPC 601 processor does assert ARTRY_, then the alternate master discards the read data and backs off the bus allowing the PowerPC 601 processor to update memory. The alternate master then reruns the bus cycle to obtain the updated copy. If the alternate master is writing data to DRAM then an ARTRY_ from the PowerPC 601 processor implies a pipeline collision. The alternate master must retain the data so that the write cycle can continue to be rerun until the PowerPC 601 processor pipeline collision clears. This scenario has the benign side-effect that DRAM is updated with the same data more than once.

Bus Errors

Any access to undecoded address space will result in a Transfer Error Acknowledge (TEA) asserted by FAT AMIC after a 40 µsec time-out. While in 680x0 based Macintosh computer's BERR time-outs where frequently generated by the Slot Manager, SCSI driver, and so on, and were generally recoverable, this is not the case in WS 9150. A cycle terminated with TEA is not in general recoverable due to the more or less independent operation of the Bus Interface, Branch, and Integer Execution Units within the PowerPC 601 processor. To prevent this, the Memory Management Unit (MMU) should be used to map only that space which is decoded by hardware. This can be determined at start-up by testing the various

optional address spaces in the PDS range, using carefully written code. With the proper MMU setup, accesses to undecoded address space will generate an addressing exception from the MMU, which is recoverable. The only changes made to the PDM bus operation for WS 9150 are the expansion of the arbitration to allow for both the NuBus controller and the VRAM based frame buffer. PDM only accommodates one at a time.

Workgroup Server 9150: Memory Overview (4/94)

Revised: 4/26/94
Security: Everyone

Workgroup Server 9150: Memory Overview (4/94)

==========

Article Created: 26 April 1994

TOPIC -----

This article provides a memory overview of the Workgroup Server 9150 (WS 9150).

DISCUSSION -----

The Workgroup Server 9150 computer's memory is organized in three levels:

- Internal cache
- External second level cache
- Main memory array

Access to data or instructions in memory, including routine copy back and refill maintenance is controlled by hardware. The main memory array is buffered from the cached bus so that external second level cache operations can proceed simultaneous with video refresh, I/O DMA, and other operations.

All memory operations are controlled by the High speed Memory Controller (HMC) ASIC.

Workgroup Server 9150 supports a single 32 bit memory map. Virtual memory is supported through the PowerPC 601 processor's internal memory management unit. The physical memory map is shown below. Of course the logical memory map is up to the discretion of the system programmer and may be configured to provide a Macintosh compatible 24 bit address space.

Workgroup Server 9150: Video Support (4/94)

Revised: 4/26/94
Security: Everyone

Workgroup Server 9150: Video Support (4/94)

==========

Article Created: 26 April 1994

TOPIC ----------

This article describes the video capability of the Workgroup Server 9150 (WS 9150).

DISCUSSION ----------

The WS 9150 uses DRAM for video buffering when connecting to the built-in DB-15 socket on the back of the computer. This DB-15 socket supports these monitors:

Monitor	Size (pixels)	Color depth (bits)
12-inch RGB	512 by 384	16
14-inch RGB	640 by 480	16
15-inch portrait	640 by 870	8
16-inch RGB	832 by 624	8
VGA	640 by 480	8

Bandwidth limitations prevent the WS 9150 from supporting 16 bit pixel depths on the larger monitors.

For larger monitors on the WS 9150 use either a NuBus, or PDS video card. The amounts of VRAM on the card will support larger monitors at greater color depth.

Workgroup Server 6150, 8150, and 9150: DRAM Expansion (4/94)

Revised: 4/26/94
Security: Everyone

Workgroup Server 6150, 8150, and 9150: DRAM Expansion (4/94)

==========

Article Created: 26 April 1994

TOPIC --------------------

This article describes the DRAM expansion for the Workgroup Server (WS) 6150, WS 8150, and WS 9150.

DISCUSSION --------------------

Like the Power Macintosh models, RAM for the Workgroup Server computers is provided by dynamic random-access memory (DRAM) chips, of which the first 8MB of RAM capacity is soldered to the main logic board. Users may expand RAM capacity by adding 72-pin Single Inline Memory Modules (SIMMs) of 80ns or better in pairs of 4 MB, 8 MB, 16 MB, or 32 MB in size.

The WS 6150 has two SIMM slots, the WS 8150 has eight SIMM slots, and the WS 9150 has eight SIMM slots.

DOS Compatibility Card: Using Newton Connection Kit (5/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: Using Newton Connection Kit (5/95)

==========

Article Created: 28 April 1994
Article Reviewed/Updated: 9 May 1995

TOPIC ----------

I Want to be able to use the Newton Connection Kit for Windows on Quadra 610 DOS Compatible computer. Is this possible?

DISCUSSION ----------

We were successful in connecting an Apple MessagePad to the Quadra 610 running the DOS Compatible Card. The following steps were taken. The sequence is important, start with the Macintosh configuration, then Windows, then Apple MessagePad.

Macintosh Configuration

Step 1:
Open PC Setup in the control panel. Select the "Modem Port" option under the "comm1" pull down menu.

Step 2:
Close the control panel.

Step 3:
Switch back to the PC environment by pressing Command-Return.

Step 4:
Connect the Apple MessagePad to the Modem Port.

Windows Configuration

Step 1:
Install the Windows Newton connection software.

Step 2:

Launch windows.

Step 3:
Launch the Newton Connection application.

Step 4:
Pull down the Newton menu and select "preferences".

Step 5:
Select the "port setup..." button.

Step 6:
Make sure only comm1 is checked in the check boxes to the right.

Step 7:
Select 19,200 as the maximum baud rate.

Step 7:
Click OK. Then click OK again to exit all open windows.

Step 8:
Exit the Newton Connection application and then re-launch it.

Apple MessagePad

Launch the connection icon on the Apple MessagePad, and it should work.

Windows LaserWriter Utility (5/95)

Revised: 5/24/95
Security: Everyone

Windows LaserWriter Utility (5/95)

==========

Article Created: 27 April 1994
Article Reviewed/Updated: 16 May 1995

TOPIC ----------

There is a Windows utility included with the Laserwriter Select 360 printer that performs similar functions as the LaserWriter Utility in the Macintosh environment.

Does this updated software come with the LaserWriter Pro 630 printers that are currently shipping?

If the software does not come with this printer can our dealers copy the Windows utility software and distribute it to customers who want its functionality?

DISCUSSION ----------

The LaserWriter Utility for Windows provides similar functionality to the Macintosh version. This utility only started shipping with the LaserWriter Select 360, and will ship with future printers. The utility was not rolled into the LaserWriter Pro 600/630 because there was minimal testing on this printer. It should, however, work without any problems.

Apple currently supports this utility only on the LaserWriter Pro 600/630 and LaserWriter Select 360. It should, however, work with Apple's other DOS/Windows-marketed printers (such as Personal LaserWriter NTR and LaserWriter Select 310).

AppleShare 4.0.2 READ ME File (4/94)

Revised: 5/10/94
Security: Everyone

AppleShare 4.0.2 READ ME File (4/94)

==========

Article Created: 27 April 1994

TOPIC -----

This article is the AppleShare 4.0.2 READ ME file.

DISCUSSION -----

This document provides important information about AppleShare 4.0 (including version 4.0.2). Some of this information is not included in the "AppleShare Administrator's Guide." You may want to print this document and keep it with the "AppleShare Administrator's Guide."

Choose Screen Savers Carefully

There are many screen savers on the market that can be used to prevent screen burn-in on AppleShare servers. Some screen savers are quite elaborate and perform many complex calculations to draw a single picture on the screen. Since they require significant amounts of CPU time, the more complex screen savers will reduce the performance of your AppleShare server. Please choose the screen saver that interferes the least with your AppleShare server.

Some screen savers are not compatible with AppleShare 4.0 and can cause your AppleShare file server to crash or hang. Before purchasing or using a screen saver, check with the screen saver's manufacturer to determine if the screen saver will work properly with your AppleShare file server.

Optimize Memory Usage

AppleShare 4.0 uses caching techniques to improve the performance of the file server. Caching stores frequently used items, such as folders, icons, and parts of documents, in high-speed memory. Items in memory can be retrieved faster than items stored on disk.

In general, the more you increase the size of the cache, the better your AppleShare file server will perform. However, increasing the size of the cache

also increases the amount of server memory your AppleShare file server requires. If you increase the size of the cache by too much, your other server application programs (such as AppleShare Print Server) may not be able to run in the remaining memory.

To be sure that all your server application programs have enough memory to operate correctly, start AppleShare file service after you have opened all your other server application programs. If there is not enough memory to start AppleShare file service with the cache size you requested, AppleShare will decrease the size of the cache until it fits in the available memory.

If, however, the primary purpose of your server system is to provide AppleShare file service, then you may want to start AppleShare file service first. This will allow AppleShare to allocate all the memory it needs. You can then use the remaining memory for your other server application programs.

If you are using a backup utility that periodically backs up your file server data, be sure to leave enough memory available for the backup utility to function properly.

If you are having problems opening windows in the Finder, reduce the size of the cache until there is enough memory for the Finder to work properly.

Using System 7 Disk Cache With AppleShare 4.0

In addition to the caching provided in AppleShare 4.0, System 7 also provides disk caching. Depending on how you use AppleShare 4.0, you may notice an improvement in performance by adjusting the server computer's disk cache size. Cache sizes in the range 32K to 128K are valid settings for use with AppleShare. Settings higher than 128K will provide little additional improvement in performance and will waste memory. In general, increasing the size of the cache for your AppleShare file server will provide a more substantial performance improvement than increasing the size of the System 7 disk cache.

System 7 ships with disk cache turned on and set to 96K. You may wish to experiment with higher settings. (You adjust the cache size in the Memory control panel.) Depending on the type of server usage in your work environment, you may notice better server performance.

If you change the size of the disk cache, be sure to restart the server computer for the new size to take effect.

Using Virtual Memory With AppleShare 4.0

Using virtual memory affects the performance of your server application programs. DO NOT turn on virtual memory with your Workgroup Server.

Using Special Characters in Server Names

AppleShare Admin will not allow the administrator to enter a server name that contains a "/" character. If you must have a "/" character in the name of your server, use the following workaround:

1) Shut down file service.
2) Quit AppleShare Admin.
3) Drag the Users & Groups Data File from the Preferences folder to the System Folder.
4) Using the Sharing Setup control panel, change the Macintosh name to the Server name you want.
5) Start AppleShare Admin.
6) Fill out the information in the Administrator Information and Serial Number dialog box.
7) When the Server Name dialog box appears, do not change the server name. Just enter the Admin Key and click OK.
8) Quit AppleShare Admin.
9) Drag the Users & Groups Data File from the System Folder to the Trash. It is no longer needed. A new Users & Groups Data File has been created in the Preferences folder.

Retaining Access Privileges While Upgrading From Macintosh File Sharing
---

If you are upgrading from Macintosh file sharing while using new server hardware, your original access privileges will not be retained in some circumstances. Specifically, if you copy information from the startup volume using the Finder, your access privileges for that volume will not be retained. The "AppleShare Administrator's Guide" instructs you how to manually re-establish those access privileges on the new server. For startup volumes that have only a few shared items and only a limited number of folders with specific access privileges, this is the best approach. However, if your startup volume has many folders with different access privileges, then you may want to use the following workaround.

Follow the instructions in the "AppleShare Administrator's Guide" for upgrading from Macintosh file sharing. When the instructions ask you to copy the data from the startup volume, use the instructions below instead. Then finish the rest of the instructions in the "AppleShare Administrator's Guide."

1) Connect an empty (unused) external disk to your old system.
2) Copy AppleShare Admin from your AppleShare 4.0 Installer disk to your startup volume. AppleShare Admin is in the "AppleShare File Server" folder. If you received the AppleShare CD-ROM disc, the "AppleShare File Server" folder is in the "AppleShare" folder, which is in the "AppleShare for Power Macintosh" folder.
3) Open AppleShare Admin. The "Users & Groups Data File was not found" dialog box appears.
4) Select "Use System 7," and click OK.
5) Enter a serial number in the Administrator Information and Serial Number dialog box.
6) Enter a server name and Admin Key in the Server Information dialog box.
7) Wait for Admin to finish starting up.
8) Use the Copy <item> command to copy the contents of your startup volume to the external disk.
9) Quit AppleShare Admin, and drag it to the Trash.
10) Drag the newly created Users & Groups Data File from the Preferences folder to the Trash.
11) Drag the old Users & Groups Data File from the floppy (where you saved

it earlier) to the Preferences folder.
12) Attach the external disk to your new server.

AppleShare Admin 4.0 runs on 68040- and PowerPC-based systems. If you are running Macintosh file sharing on other than a 68040 or PowerPC system, use either AppleShare Admin 3.0 or a third-party backup program to copy your startup volume. Contact your Apple support representative for assistance.

Install Fonts Before Using Online Documentation

If you received AppleShare 4.0 on a CD-ROM disc, online documentation for the "AppleShare Administrator's Guide" is included on the CD-ROM disc. Before you can use the documentation, you must first install the fonts required by DocViewer into your system. Those fonts are on your CD-ROM disc in the "Apple DocViewer Fonts" folder, which is in the "Apple DocViewer 1.1" folder. The "Apple DocViewer 1.1" folder is inside the "AppleShare Electronic Library" folder. You can install the required fonts into your system by dragging their icons into the Fonts folder, which is in the System Folder. Some DocViewer fonts may already be in your Fonts folder. Drag only those fonts that are missing from your Fonts folder.

Use Caution When Removing the Workstation

The Installer will allow you to remove AppleShare 4.0 software as well as install it. Be aware that removing the Workstation software requires you to restart your Macintosh computer. Restarting your Macintosh computer will break your connection with your AppleShare file server. Since there is no longer any Workstation software on your Macintosh computer, you will be unable to reconnect to your AppleShare File Server. You will need to reinstall the Workstation software from the "AppleShare Workstation" floppy disk before you can reconnect to your AppleShare File Server.

Install System 7.1 First

Always install System 7.1 first, then install AppleShare 4.0. If you install System 7.1 after you install AppleShare 4.0, the Apple Shared Library Manager will not function correctly. Since AppleShare 4.0 uses the Apple Shared Library Manager, it will also not function correctly.

If you need to reinstall System 7.1 for any reason, remove the Shared Library Manager from the Extensions folder and then reinstall AppleShare 4.0.

Use Separate Aliases for Shared Items

Aliases to shared folders can be created by the AppleShare server (using the Finder). Those aliases can be shared with workstations by placing them in a shared folder. If a shared alias is used by a workstation, the alias may be modified in such a way that it is no longer usable by the Finder on the AppleShare server. This can only happen with shared-item aliases created on an AppleShare server.

To avoid this problem, use separate aliases for shared items. Create two aliases to the same shared item, using the Finder on the AppleShare server.

Place one alias in a shared folder for use by workstations. Keep the other alias in a folder that is not shared with workstations.

Serial Numbers Are Not Updated Immediately

Using AppleShare Admin, you can change serial numbers while file service is running. However, the old serial number will remain in effect until you restart file service.

If you change serial numbers to eliminate a duplicate serial number, you will continue to receive duplicate serial number notifications until you restart file service. Likewise, if you accidentally change the serial number to one that is already in use by another file server, you will not receive duplicate serial number notifications until you restart file service.

In addition, once you change to a new serial number, the old serial number will no longer be displayed by AppleShare Admin. To avoid confusion about which serial number is in use, restart file service immediately after changing the serial number.

Some Greeting Messages May Not Appear on System 7 Workstations

Macintosh system software includes AppleShare Workstation software. You can use that software to log on to and use any AppleShare server, including an AppleShare 4.0 server. However, the AppleShare Workstation software supplied with system software does not accept the full range of server greeting messages that can be sent from an AppleShare 4.0 server.

To ensure that the full range of greeting messages is displayed on all workstations, use the AppleShare Workstation software included with your AppleShare 4.0 software. See your "AppleShare Administrator's Guide" for how to install the Workstation software.

Working With a Large Users & Groups Data File

AppleShare Admin is factory configured to work with a Users & Groups Data File that has a maximum of 1900 users. If you have a large user community, you may need to increase the capacity of AppleShare Admin. You can increase the capacity of AppleShare Admin by increasing the preferred memory size in the Admin Info window. (In the Finder, select the AppleShare Admin icon, then choose Get Info from the File menu.) AppleShare Admin needs a minimum of 400K of memory. Increase Admin's preferred memory size by 100K for each additional 1000 users in your user community. For example, AppleShare Admin needs 500K of memory to handle 2900 users. Likewise, it needs 600K of memory to handle 3900 users.

Using Retrospect Remote With AppleShare 4.0

If you are backing up a large number of files, you may need to give Retrospect Remote more application memory. See your "Retrospect Remote User's Guide" for guidelines on when to increase the size of your Retrospect Remote application.

Using Microsoft Mail Client Software on Your Server

If you are using Microsoft Mail client software on your AppleShare server, use these directions for installing your Microsoft Mail software:

1) On your server computer, turn AppleTalk off. (Open the Chooser, then select the AppleTalk Inactive radio button.)
2) Follow the instructions included in your documentation for installing Microsoft Mail in low-memory conditions.
3) Drag and drop all the Microsoft Mail files in their proper location except the AppleTalk files. Those files should not be installed on your server system.
4) Turn AppleTalk back on. (Open the Chooser, then select the AppleTalk Active radio button.)
5) Restart your server system.

Capitalize Apple II Shared Items

If you are experiencing problems moving files between your AppleShare file server and your Apple II workstation, try capitalizing the name of the shared item. For example, use a shared item named ARTCLASS rather than ArtClass.

Use QuickTime 1.6.1 on Workstations

If you are using NOW utilities on your workstation, and also have QuickTime 1.6 on your workstation, your workstation may hang when logging on to an AppleShare file server. This may occur when logging on to a server through either the chooser, or through an alias. To correct this problem, install QuickTime 1.6.1 on your workstation. Alternatively, removing QuickTime 1.6 or the NOW utilities from your workstation will also fix the problem. You may also experience problems if you are using the HAM (HierArchial Menu) utility.

If you received AppleShare 4.0 on a CD-ROM disc, QuickTime 1.6.1 is in the "Extras" folder, which is in the "AppleShare Tidbits" folder. The "AppleShare Tidbits" folder is in the "AppleShare" folder, which is in the "AppleShare for Power Macintosh" folder. If you received AppleShare 4.0 on floppy disk, QuickTime 1.6.1 is inside the "Extras" folder on the floppy disk labeled "AppleShare Tidbits."

Using the Apple IIe or the IIe Card for the Macintosh LC

If you are experiencing problems logging on to an AppleShare 4.0 File Server from either an Apple IIe or a Macintosh LC with a IIe card, contact your Apple support representative. Ask your representative to supply you with the upgraded software required to fix the problem.

Use the International Menu to Choose the Roman Keyboard

Using KanjiTalk 7.1, there are two ways to select the Roman keyboard. You can use either the international menu or the keyboard palette. When entering the product serial number into the File Server Serial Number Preferences dialog, use the international menu to select the Roman keyboard rather than the keyboard palette. The keyboard palette does not work correctly.

Specifically, before you open AppleShare Admin for the first time, use the international menu to select the Roman keyboard. Afterwards, open AppleShare Admin and enter the serial number into the File Server Serial Number Preferences dialog.

If you need to change your serial number, remember to select the Roman keyboard before selecting File Server Serial Number Preferences from the Server menu.

Logging On to an AppleShare File Server From a PhoneNet PC Client

Using AppleShare Admin, you can force new AppleShare users to change their password the first time they log on to your server. If new users are experiencing problems logging on to an AppleShare file server with PhoneNet PC, try letting the user keep the original password.

Modifying Users & Groups Information on a Server That Also Has Apple Remote Access

If you install AppleShare on a server that also has Apple Remote Access, the ability to work with Users and Groups from Apple Remote Access is disabled. Instead, use AppleShare Admin to work with Users and Groups.

Avoid Giving Users Access to the Root of a Volume

Using AppleShare Admin, you can give workstation users access to either the root of a volume, or to specific shared items within that volume. To ensure the security of your file server, give workstation users access to shared items only.

Opening Applications over the Network

If you are experiencing problems opening applications over the network from your AppleShare file server, and your workstation is a 68040-based Macintosh, try installing "Network Launch Fix" into the Extensions folder of your workstation.

If you received AppleShare 4.0 on a CD-ROM disc, "Network Launch Fix" is in the "Extras" folder, which is in the "AppleShare Tidbits" folder. The "AppleShare Tidbits" folder is in the "AppleShare" folder, which is in the "AppleShare for Power Macintosh" folder. If you received AppleShare 4.0 on floppy disk, "Network Launch Fix" is inside the "Extras" folder on the floppy disk labeled "AppleShare Tidbits."

Using a Macintosh Quadra 605 or Macintosh LC 475 as a File Server

If you are experiencing problems using a Macintosh Quadra 605 or a Macintosh LC 475 as a file server, try setting the server monitor to black and white. Open the Monitors control panel and select "Grays: Black & White."

Improving File Server Performance

AppleShare 4.0 allows you to adjust the amount of cache used for each open file. Normally, this value is set to 64K bytes per file. You may see better performance by setting this value to 128K bytes or higher. Using AppleShare

Admin, you can change this value by selecting File Server Cache Preferences from the Server menu.

Negative File Sizes

In some views, the Finder displays the size of a file next to the file's name. If the Finder is displaying negative file sizes for files stored on AppleShare servers, upgrade to the latest version of AppleShare Workstation. Use the "AppleShare Workstation" disk provided with your AppleShare software to install the latest version. You can also install the AppleShare Workstation software over the network. Follow the instructions in the "AppleShare Administrator's Guide" to install the AppleShare Workstation software.

Using Apple Internet Router With AppleShare 4.0

If you are running an AppleShare 4.0 file server on the same machine as an Apple Internet Router, when shutting down the machine, be sure to quit the file server before quitting the router.

Mounting CD-ROM Discs While the File Server Is Running

If you are experiencing problems mounting CD-ROM discs on your AppleShare file server, make sure the "Desktop Manager Fix" is in the Extensions folder of your server.

If you received AppleShare 4.0 on a CD-ROM disc, "Desktop Manager Fix" is in the "Extras" folder, which is in the "AppleShare Tidbits" folder. The "AppleShare Tidbits" folder is in the "AppleShare" folder, which is in the "AppleShare for Power Macintosh" folder. If you received AppleShare 4.0 on floppy disk, "Desktop Manager Fix" is inside the "Extras" folder on the floppy disk labeled "AppleShare Tidbits."

Initializing Floppy Disks on an AppleShare 4.0 File Server

If you are experiencing problems initializing floppy disks on an AppleShare 4.0 file server that has connected users, try removing the PC Exchange control panel from the Control Panels folder in the System Folder, and then restarting.

Opening documents using an alias

Your AppleShare file server can contain aliases for documents that are located on other AppleShare file servers. If you are experiencing problems opening documents on other servers using an alias, contact your Apple support representative for a fix.

Apple Data Modem 2400: Pass Through Port Problem (4/94)

Revised: 4/29/94
Security: Everyone

Apple Data Modem 2400: Pass Through Port Problem (4/94)

==========

Article Created: 25 April 1994

TOPIC ----------

The pass through port on my Apple Data Modem 2400 has worked to connect to the administrator port on a Farallon Star Controller, but it won't work to a Personal LaserWriter LS.

In further testing, I found the pass through port works on a StyleWriter II, but not a Personal LaserWriter LS. I used a Macintosh SE/30 (system 7.0.1•) and Macintosh Classic II (System 7.1) with the Personal LaserWriter LS driver from System 7 and the Personal LaserWriter 300 v1.2 driver. The printer will not identify -- yes, and the light was amber (to allow pass through), not green on all four tests.

Why isn't this working?

DISCUSSION ----------

The problem is related to the modems inability to effectively handle high speed serial communication. The modem was developed before the personal LaserWriter series was developed. The Personal LaserWriter LS printers reach speeds of 769 Kbps. The modem can only handle 57.6 Kbps.

Apple Color Printer: Use ColorSync instead of CIE Values (4/94)

Revised: 4/28/94
Security: Everyone

Apple Color Printer: Use ColorSync instead of CIE Values (4/94)

==========

Article Created: 28 April 1994

TOPIC --

Customer is looking for the Adobe Photoshop Patch Color Values for the Apple Color Printer. Customer has contacted Adobe and they have informed her that this would be information that would have to be obtained from the manufacturer. Customer says that this would be the CIE coordinates for these colors used in the printer.

DISCUSSION --

What the customer is looking for here can easily be resolved by using ColorSync which is included with the Apple Color Printer software.

Assuming that they are looking for the x,y,Y values for CMYK which are in the "Custom" Ink Colors popup in "Printing Inks Setup", this feature of Photoshop allows the user to manually calibrate to the printer. The easier way to obtain calibration would be to use ColorSync which automatically calibrates between the monitor and printer. There is an Apple Color Printer profile which ColorSync uses and can be selected in the "Color" options dialog in the Print dialog of the Apple Color Printer.

LaserWriter Select 360f: Fax Imaging Information (4/94)

Revised: 4/28/94
Security: Everyone

LaserWriter Select 360f: Fax Imaging Information (4/94)

==========

Article Created: 28 April 1994

TOPIC ----------

I have a LaserWriter Select 360 with the Fax option and want to know:

* If the images are stored as bitmaps, or if it buffers the Postscript code itself?

* If they are bitmaps, what resolution (fax resolution or full 600dpi)?

* How does broadcasting affect the RAM usage?

* What is the "faxopsexec" that is on the sample cover page that is used to access the fax features?

DISCUSSION ----------

There are two types of PostScript Fax jobs. You can able to select between transmission of PostScript Language data and raster data. Subsequently, PostScript Fax printers may send faxes as raster data, or when communicating with another PostScript fax printer they may send PostScript language data. Either way a PostScript job is sent from the client to the printer to be either transmitted or rastorized then transmitted.

Single destination

A fax transmission in raster form to a single destination will be made in a single call if there is sufficient storage to hold all of the raster pages of the job. However, the transmission may be broken into multiple calls if there is not sufficient storage. If the storage of the raster pages is exhausted, then a call will be made before rasterization is complete. Transmission and raterization will then take place simultaneously. If transmission succeeds in sending all prepared pages before raterization of the job is finished, the call will end. A subsequent call will be made either when all of the rasterization is done or when storage is again exhausted. Thus, a transmission may be broken up

into multiple calls. It is also possible that when transmission and raterization are taking placed simultaneoulsy, rasterization keeps up with transmission. In this case, this transmission will be the last call for the job. If the storage in use is a disk, there will typically be sufficient storage for all of the raster pages of a job and the fax will be transmitted in a single call.

It is possible to request that a transmission take place at a particular time. These delayed transmissions, of course, are made with a single call. Since the pages of a raster job are prepared when the job is submitted, all of th pages of a delayed raster transmission must fit in storage, otherwise, the job will fail.

Multiple destinations

For a raster fax, the common body is rasterized and compressed only once. For a PostScript language file transmission, the out-bound file is assembled only once. Then, in either case, the previously prepared material is transmitted multiple times - one copy to each different recipient specified. Thus, one requirement for a broadcast job to succeed is there must be sufficient storage (RAM or disk) to hold all outgoing files that form the fax. Broadcast transmissions are not broken into multiple calls.

Resolution

Raster data - the specification for CCITT fax resoution is approximately, but not precisely, 200 dots per inch (dpi). A non-integral resolution would drastically decrease the efficiency of the PostScript interpreter. More importantly, the precise scaling generates moiré patterns in halftones rasters, that may be prevented by rounding. Therefore, a rounded scaling to 200 dpi is performed.

PostScript data - PostScript file transmission to another PostScript compatible faxscimile is output at printer resolution (300 dpi or better).

faxopsexec
---
faxopsexec is an exec, that pushes the Fax Options dictionary onto the stack, in order to execute the PostScript operand that precedes it.

Adobe uses faxopsexec to access predefined PostScript procedures implemented in an invisible, inaccessible dictionary. These ProcSets (dictionaries containing procedures) are not documented as they are either confidential, likely to change, reserved, have functionality useful only to Adobe, etc.

System Update 3.0 Read Me (5/96)

Revised: 9/30/96
Security: Everyone

System Update 3.0 Read Me (5/96)

==========

Article Created: 28 April 1994
Article Reviewed/Updated: 27 May 1996

TOPIC ----------

This is the Read Me for System Update Disk v 3.0

DISCUSSION ----------

System Update 3.0 (1.44 MB floppy disk version)

What is System Update 3.0?

System Update 3.0 is a set of software enhancements that improves the performance and reliability of Macintosh computers running system software version 7.1, 7.1.1 (System 7 Pro), or 7.1.2 (for Power Macintosh).

System Update 3.0 provides all of the enhancements of System Update 2.0.1, Hardware System Update 2.0, and Hardware System Update 1.0, plus additional enhancements. (For a review of the System Update 2.0.1, Hardware System Update 2.0, and Hardware System Update 1.0 enhancements, see "What Other Enhancements Does System Update 3.0 Provide?" at the end of this document.)

What are the enhancements that System Update 3.0 provides?

System Update 3.0 introduces the following enhancements:

• Provides system-level improvements to increase overall system performance and reliability on most Macintosh models.

• Corrects a problem that caused some programs to quit unexpectedly or caused the computer to freeze when you attempted to open programs over the network. This includes/replaces all of the functionality of Network Launch Fix (and the Installer will delete it).

• Corrects a problem that potentially allowed the system to become corrupted during a power failure or a crash. This corruption would prevent the Macintosh from restarting.

• Prevents a PowerBook from trying to spin up its hard drive when the system needs to warn the user that there are only 10 seconds of battery power remaining.

• Fixes a problem that prevented the Macintosh Plus from using any system software newer than 7.1. Users wishing to upgrade to newer system software must also delete the Finder Preferences file from the Preferences folder and restart.

• Fixes the "About This Macintosh" box so the memory usage line does not get drawn outside of the box's bounds.

• Prevents the potential file/media corruption that can happen when working with a file that is on a remote volume and the connection to that volume is lost. Now, when the remote volume is lost, its icon will remain dimmed on the desktop (similar to what happens to the icon for a manually ejected floppy disk). All attempts to open items on the lost volume will result in an access privilege error. If you need to save your work on the open file, you will need to use "Save As..." (or the equivalent) to save it to a different volume. In order to re-connect with the lost volume, you will first need to close the file you were working with, then drag the lost volume's dimmed icon to the Trash.

• Increases reliability for remote file saving when the client is running System 7.1 or greater and the server is running a pre-7.0 system and using pre-3.0 AppleShare.

• Fixes a problem with throwing away folders that are on an AppleShare volume. Sometimes when attempting to empty the Trash, the Finder would warn that the folder contained items in use and could not be deleted. The Finder will now properly delete such folders.

• Fixes a problem where a Power Macintosh, Quadra 840AV, or 660AV may hang if a CD-ROM disk is inserted when file sharing is on and a large file is being transferred.

System Update 3.0 includes the following updates:

• Updates the Standard File package to include many fixes and enhancements. The most significant fix corrects a crash problem when more than 20 volumes are mounted. The most significant enhancement is the use of color icons.

• Updates the Easy Access control panel to version 7.2. This new version allows Sticky Keys to remain active after waking up if it was active when the PowerBook or Portable went to sleep. Also, Easy Access now remembers whether sticky keys, mouse keys, and slow keys were on or off between restarts.

• Replaces TeachText with SimpleText version 1.0. Among other improvements, SimpleText allows multiple documents to be open simultaneously, and allows users to easily use a variety of fonts, font sizes, and font styles.

• Includes Apple HD SC Setup version 7.3.1,. This new version fixes a crash problem version 7.3 has when run on Macintosh models that do not support virtual memory.

• Updates the Memory control panel to version 7.3. This new version prevents a potential crash during boot if the RAM disk was set too large. Also, this control panel now opens with 32-bit addressing on.

• Updates the PowerBook control panel to version 7.3.1, the PowerBook Setup control panel to version 7.3.1, and the PowerBook Display control panel to version 1.1. This package of related control panels reorganizes and simplifies several controls.

• Updates the Battery desk accessory to version 7.1.1. This new version provides better support for the Duo 230.

• Updates the TV Setup control panel to version 1.0.1. This new version supports HRC cable systems. This version also fixes a problem that would sometimes cause the screen to darken after returning from TV mode.

• Updates the Screen control panel to version 1.0.4. This new version corrects a problem on the LC 575.

• Updates the PC Setup control panel to version 1.0.2. This version provides a fix for users of the Macintosh DOS Compatibility Card that are experiencing interference when using a single 14" display and the PC is in the foreground. If you are experiencing an interference problem, make sure the "Fade Screen" option is selected in the updated PC Setup control panel. With this option selected, switching to the Macintosh will be slightly slower but the video interference will disappear.

• Updates System Enabler 003 to version 1.1 for use with the LC III.

• Updates System Enabler 040 to version 1.1 for use with the Quadra 610, 650, and 800 and the Centris 610 and 650. This update also adds support for the Quadra 610 and 650.

• Updates System Enabler 065 to version 1.2 for use with the Quadra 605, LC 475, and LC 575. This new version removes some minor unnecessary components.

• Updates System Enabler 088 to version 1.2 for use with the Quadra 840AV and 660AV. This update fixes some serial communication problems and delivers improvements to the Resource Manager and other system components that increase system performance.

• Updates System Enabler 403 to version 1.0.2 for use with the Color Classic II, LC 520, and LC 550.

• Updates the PowerBook Duo Enabler to version 1.0 for use with the PowerBook Duo 210, 230, 250, and 270c. This new version allows the use of type II batteries. It also incorporates the Duo Battery Patch for all PowerBook Duo models except the Duo 270c, which does not need it.

• Updates the PowerPC Enabler to version 1.0.1 for use with the Power Macintosh 6100, 7100, and 8100. This new version fixes a problem with some large monitors connected to the AV video card, improves Energy Star compatibility for certain monitors connected to the built-in video port, updates the Communications Toolbox, fixes an occasional memory manager problem, improves the serial port performance, improves the video quality of the High Performance Video card in certain situations, and preserves the "Playthrough" and "CD Audio In" settings in the Sound Control panel across reboots. The PowerPC Enabler also supersedes the files "!TYC" and "!PowerAV Update" (and the Installer will delete them).

• Updates the PowerPC Upgrade Card Enabler to version 1.0.1 for use with the PowerPC Upgrade Card installed in the Centris 610 and 650 and the Quadra 610, 650, 700, 800, 900, and 950. This new version updates the Communications Toolbox and fixes an occasional memory manager problem.

Installing System Update 3.0

Before you install...

Do you use a Macintosh II, a Macintosh SE or a Macintosh Plus?

If you use a Macintosh II, a Macintosh SE, or a Macintosh Plus computer, then you need the version of System Update 3.0 that comes on an 800K floppy disk, unless your computer has been upgraded with a 1.4 MB floppy disk drive or you have network access to a Macintosh that has 1.4 MB floppies (see "Network Installation Instructions" below for information on installing over a network). The 800K package is a special version of System Update 3.0, including only the files needed for those three models of Macintosh. If your computer has been upgraded with a 1.4 MB floppy disk drive, then you can use the version of System Update 3.0 that comes on the high-density (1.4 MB) floppy disks.

If you have any Macintosh computer other than these three, you must use the version of System Update 3.0 that comes on two high-density (1.4 MB) floppy disks. Do not use the version of System Update 3.0 that comes on an 800K disk. It does not include all of the files that you need.

Do you have Macintosh system software version 7.1, 7.1.1, or 7.1.2?

You should install this update only if you have Macintosh system software version 7.1, 7.1.1, or 7.1.2 installed on your computer.

If you have already installed earlier system updates, you should still install System Update 3.0 in order to have the latest version of all system software. System Update 3.0 provides additional functionality and fixes problems that the earlier updates did not address.

Installation of System Update 3.0 includes three steps:

1. Install the System Update
2. Update your Apple utilities
3. Update your Apple drivers

See the step-by-step instructions below.

Step 1: Install the System Software Update

To install the system software update, follow these steps:

1. If you currently have the Connectix Enabler Patch on your hard disk, remove it from your hard disk before proceeding with this installation.

2. Insert System Update 3.0 Disk 1 in your floppy disk drive.

3. Double-click the Installer icon.

4. Read the Welcome screen, and then click OK.

5. Click the Install button.
